Throughout the 1990s institutional homophobia may have served as a rallying cry in response to entrenched social injustice, and, as a result of political action, culturally sanctioned homophobia is on the decline. But paradoxically, this has resulted in a form of homonormativity that will likely underscore and increase prejudice toward those whose lives do not reflect Western, middle-class, mainstream, nuclear family values (whether in same or differently gendered marriages). This potentially excluded group includes not only nonnormative queers, but single- and extended-family households, as well as the alternative communal arrangements for support that many people cultivate for themselves and their chosen kin.

Homophobia is a culturally learned prejudice. It stands to reason, therefore, that the manifestations and experiences of homophobia will differ across cultural contexts and situational circumstances. Future activism and scholarship should focus on the multiple factors associated with varying forms of homophobia and also demonstrate the complex ways in which these factors intersect with other forms of difference, inequality, and cultural status. Recent scholars have begun to highlight the complexities of homophobia by intersecting it with informed, critical analyses of institutions such as religion, family, and migration status. These studies reveal a complicated terrain marked by tensions and contradictions, none of which can be reduced to a monolithic concept of homophobia operating outside the parameters of cultural and historical context. In short, we must complicate the idea of 'gayness' masquerading as a master status that presumably transcends other forms of difference; as a kind of 'one size fits all' form of discrimination that is too often applied universally and uncritically.

Heterosexual Expression at Older Ages

Amelia Karraker, University of Michigan, Ann Arbor, MI, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article reviews recent research on the roles of marital status and dyadic characteristics, physical and mental health, attitudes and beliefs, and cohort effects in sexual expression. It also focuses on gender differences in the roles of these factors in sexual expression and suggests directions for future research.

Introduction

Sexual expression is an integral component of human experience throughout life, including older ages. Although scholarship on sexual expression has focused primarily on populations of reproductive age or younger, interest in sexual expression over the life course has increased in recent years, in part because of the aging of the large cohort of Baby Boomers into older age (*see* Sexuality over the Life Course, this volume). The potential consequences of sexual expression are numerous. Among other potential benefits, sexual activity at older ages is associated positively with physical health (Lindau et al., 2007), well-being (Ganong and Larson, 2011), and relationship quality (Karraker and DeLamater, 2013), and surveys of attitudes suggest that sexual expression remains important to many older adults (Waite et al., 2009). This article begins by defining and describing sexual activity at older ages, defined as approximately age 55 and older. As sexual expression occurs at the intersection of biological, psychological, social, and cultural factors, the article reviews recent research on the roles of marital status and dyadic characteristics, physical and mental health, attitudes and beliefs, and cohort effects in sexual expression. Throughout, it focuses on gender differences in the correlates of sexual expression. The article concludes by outlining avenues and opportunities for future research.

Defining and Describing Sexual Activity at Older Ages

Before examining the factors of sexual expression at older ages, an important first step is to establish what 'sex' is and how its definition may vary by age. Landmark studies of sexuality at various periods of the life course have utilized relatively expansive definitions of sexual activity. For example, the National Social Life, Health, and Aging Project (NSHAP), a nationally representative study of older Americans (ages 57–85 years) which begun in 2005, defines 'sex' or 'sexual activity' as "any mutually voluntary activity with another person that involves sexual contact, whether or not intercourse or orgasm occurs." (Lindau et al., 2007: p. 763) Such sexual activity may include a variety of specific acts, such as hugging, kissing, and other sexual touching (i.e., 'foreplay'); giving and receiving oral sex; and vaginal intercourse, among other behaviors. Consistent with findings of younger people taken from the National Health and Social Life Survey (Laumann et al., 1994), the majority of older sexually active men and women report that vaginal intercourse (74–91%, depending on age and gender) and 'kissing, hugging, or other sexual touching' (nearly 90% or higher for all age-gender groups) 'usually' or 'always' occurs during sex (Waite et al., 2009: p. i59). However, the percentage either giving or receiving any oral sex drops markedly by age; this may reflect cohort effects, which are discussed in a subsequent section. The likelihood of sexual activity and sexual frequency varies greatly by gender and age (Lindau et al., 2007; Karraker et al., 2011). Younger people are more likely to be sexually active than older people, and men are more likely to be active than women at all ages (Lindau et al., 2007). For example, among those age 57–64 years, 84% of men reported being sexually active in the past year, compared with 62% of women; by ages 75–85 years, these percentages drop to 39% of men and 17% of women (Lindau et al., 2007).

Heterosexual expression pertains both to partnered activities, such as vaginal intercourse, as well as masturbation. For both women and men, reports of masturbation within the past year decline with age for both genders, although as for partnered activity, masturbation is more common for men than women at all ages (Waite et al., 2009). Interestingly, rates of masturbation are similar for partnered (52% of men, 25% of women) and unpartnered older adults (55% of men, 23% of women) (Lindau et al., 2007). This finding of little differences in masturbation by partner status is consistent with research on younger populations emphasizing masturbation as either complementary to partnered sexual activity or compensatory to a lack of partnered activity (Das, 2007; Kontula and Haavio-Mannila, 2003).

Sexual problems are quite common at older ages. Using data from NSHAP, Waite and colleagues (2009) found that among men who were sexually active in the past year, the most common sexual problems were erectile difficulties (30–44%, depending on age-group), premature climax (21–29%), and lack of interest in sex (24–29%). Among women sexually active in the past year, the most common sexual problems were lack of interest in sex (38–49%), lubrication problems (36–44%), and inability to climax (33–38%). The authors also found that both men and women experiencing sexual problems reported avoiding sex due to these problems. This finding, combined with the fact that these questions often are asked only of those who are currently or recently sexually active, suggests that these estimates may underestimate sexual problems if they result in cessation of sexual activity.

 http://dx.doi.org/10.1016/B978-0-08-097086-8.35004-8

Qualitative work also adds important nuance to these findings from quantitative studies. In the case of diminished physical function, some elders (both male and female) report expanded definitions of what 'sex' is, including increased emphasis on physical closeness and foreplay rather than on vaginal intercourse or the presence of erections (Vares et al., 2007; Potts et al., 2006). Furthermore, although quantitative studies document declines in the prevalence of a variety of sexual activities (Waite et al., 2009) and their frequency (Karraker et al., 2011), qualitative work has found that for some individuals, sexual satisfaction actually increased with age (Lodge and Umberson, 2012; Vares et al., 2007; Potts et al., 2006), and for others, positive sexual experiences earlier in life shaped continued pleasure in sex (Loe, 2012).

Determinants of Sexual Activity

Marital Status and Dyadic Characteristics

One of the strongest predictors of sexual activity at older ages is partner status (Lindau et al., 2007; Karraker et al., 2011), as availability of a partner is a necessary, although not sufficient, condition for many sexual behaviors. For many, but not all individuals, partner availability coincides with marital status. The distributions of marital status by gender, however, diverge with increases in age, yielding an increased share of older unpartnered women. The largest gender differences are in the proportion of older people widowed and married. Before age 40 years, widowhood is extremely rare for both men and women, but by ages 55–64 years, 2.5% of men are widowed compared with 8.1% of women, and by ages 75 years and older, 21% of men are widowed whereas almost 57% of women are widowed (U.S. Census Bureau, 2010). In contrast, among those ages 55–64 years, about 74% of men are married, compared with about 67% of women, and by age 75 years and older, nearly 70% of men are married, compared with about 32% of women (U.S. Census Bureau, 2010).

Two primary processes are driving this phenomenon of increasing partner scarcity for women with age. First, women live longer than men (Austad, 2006). Women begin to outnumber men around age 40 years, and by age 85 years, there are more than two women for every man (U.S. Census Bureau, 2006). The increasing scarcity of men with age is exacerbated by a second process: gendered marriage markets yielding age hypergamy. Age hypergamy is the tendency of men to marry women younger than themselves. Scholars argue that cultural standards that privilege youthful appearance and reproductive fitness for women, as well as economic position for men, may all be social forces contributing to age hypergamy (England and McClintock, 2009). Women partnered to same-age men already would expect to outlive their husbands on average given greater female longevity, but age hypergamy increases the length of time by which wives are likely to outlive their husbands, as well as to have a spouse in poorer health. Recent work using the NSHAP data found that, on average, men are 3 years older than their female partners (Lindau et al., 2007). Thus, although a 70-year-old man may be partnered with a 67-year-old woman, a 70-year-old woman may be partnered with a 73-year-old man. Although a 3-year age difference may not at first appear large, increasing morbidity may generate large gender asymmetries in partner health as individuals age.

Opportunities for repartnering also differ by gender. Women also are more likely to be widowed as they age (and outlive their husbands), but less likely to remarry (Buckle et al., 1996). Furthermore, there is evidence that the characteristics of older married women and men's spouses diverge with age, especially for remarriages. England and McClintock (2009) found that the older the age of men at marriage (through their 60s), the younger his wife is likely to be. Those older men who are able to attract younger female partners are likely in better physical health (and likely have other characteristics associated with sexual activity) than those who cannot. This 'double standard of aging' (England and McClintock, 2009: p. 797), may partially explain why even within marriage, older married men are more likely to report being sexually active than older married women (Lindau et al., 2007; Karraker and DeLamater, 2013).

For those individuals with partners, the characteristics of the dyadic relationship also are associated with sexual expression (see also Marital Quality and Health, this volume). Partnered sexual expression is an important component of intimate relationships for many couples and thus enhances and strengthens the relationship in many circumstances (Michael, 2004). Not surprisingly, as at younger ages, marital satisfaction remains positively associated with sexual activity at older ages (Karraker and DeLamater, 2013). The absolute differences between sexually active and inactive couples are small, however. This finding is contrasted with work on longtime married couples in middle age (those in their 40s and 50s), which has found that high initial levels of sexual satisfaction increased marital quality and decreased subsequent marital instability (Yeh et al., 2006). Taken together, these findings suggest possible differences in the relationship between marital quality and sexual activity by cohort or age. In addition, the 'aging' of relationships also is associated with sexual activity. A recent study using the NSHAP data found that marital duration was positively (though weakly) associated with sexual inactivity and that this relationship was independent of the age of both spouses and well as their physical and mental health (Karraker and DeLamater, 2013).

Physical Health and Psychological Well-Being

Few factors related to sexual expression have received as much attention as physical health. Indeed, poor physical health, which often accompanies aging, is associated with sexual expression. Physical conditions, such as cardiovascular disease, cancer, diabetes, and arthritis, can compromise sexual expression through a variety of pathways (DeLamater and Sill, 2005). Some physical illnesses can interfere with the mechanics of sexual function (see also Epidemiology of Sexual Dysfunction, this volume). For example, cardiovascular disease and diabetes can both interfere with blood flow, leading to erectile dysfunction among men. Conditions like arthritis and obesity also may create barriers to sexual activity by impairing functional health. Hormonal changes associated with biological aging may have consequences for sexual function. Declines in various hormone levels during

menopause, for example, may result in reduced vaginal lubrication, making vaginal intercourse uncomfortable or painful in the absence of additional lubrication and may result in decreased sex drive (Dennerstein et al., 2003).

As for marital status, the impacts of physical illness on sexual activity differ by gender. Prior research has found that male partner's physical health is a stronger predictor of partnered sexual activity than female partner's (Karraker and DeLamater, 2013; Lindau et al., 2007). This likely reflects gender differences in specific disease burden, as well as differences in the impact of a given condition on sexual expression. For example, although high blood pressure and vascular problems may impede a man's erectile function to the extent that vaginal intercourse is not physically possible, the same condition in a woman may not interfere substantially with sexual function.

Psychological well-being and mental health also are associated with sexual expression. In fact, although less often studied than physical health, mental health may be as strongly or more strongly associated with sexual expression than physical health. Psychological factors are deeply implicated in sexual desire (see also Sexual Motivation, this volume), which can be defined as the 'interest in being sexual' (Kingsberg, 2002: p. 434). A variety of psychological conditions are association with sexual activity, including depression, anxiety, stress, and self-rated mental health (Laumann et al., 2008; Kingsberg, 2002). Furthermore, recent work suggests that mental health conditions are associated more consistently with women's sexual problems than with men's (Laumann et al., 2008).

Medications are tied to sexual function. The medications used to treat several conditions, such as high blood pressure and depression, may create barriers to sexual activity by compromising the mechanics of sex, or the desire to engage in activity, respectively (DeLamater and Sill, 2005). Of course, the most notable medication tied to sexual activity is Viagra. Used to treat erectile dysfunction, the introduction of Viagra to the US market in 1998 represented an important shift in the ways in which Americans thought, talked, and acted about sexuality in later life (Loe, 2004) by recasting a former threat to masculinity, 'impotence,' as erectile dysfunction, a 'normal' part of aging with a biological cause, and pharmacological solution (Marshall, 2012). Using the NSHAP data, researchers estimated that 14% of men ages 57–85 years reported using either medications or supplements to improve sexual function (Lindau et al., 2007). The initial enthusiasm about these medications, however, may have been premature in some instances. One study of men taking Viagra found that 30% discontinued use (i.e., did not refill their prescription within 6 months) even though they reported that the drug was effective at treating erectile dysfunction (Klotz et al., 2005). Common reasons for discontinuation were a lack of opportunity for sex and lack of interest (both for self and partner). These findings suggest that an overemphasis on the biological mechanics of specific sexual activities (such as penetrative intercourse) for one partner in the intimate relationship is ill-advised.

Some scholars have cited the development and marketing of Viagra and other sexual dysfunction drugs reflects the growing medicalization of sexuality at older ages (Loe, 2004; Marshall, 2012). Conrad (1992: p. 211) defined medicalization as 'defining a problem in medical terms, using medical language to describe a problem, adopting a medical framework to understand a problem, or using a medical intervention to "treat" it.' The medicalization of sexuality at older ages may help to liberate sexuality among older people from taboos and stereotypes of asexual older ages or 'dirty old men,' as well as to facilitate treatment for sexual problems like erectile dysfunction, which may be indicative of underlying serious health problems. Some argue, however, that sexuality has become 'overmedicalized,' citing 'excessive medical diagnostic, workups, excessive use of medical and surgical treatments, and excessive claims about the medical causes of sexual problems' (Tiefer, 1996: p. 252). Critics posit that excessive medicalization of sexuality privileges particular forms of sexual expression as more 'valid' (such as penetrative vaginal intercourse) and equates sexual health at older ages with conformity to youthful standards of sexual function (Marshall, 2012). They argue that the study of sexual expression at older ages instead should acknowledge the diverse forms that sexual expression at older ages may take, as well as the complex interplay of biological, psychological, social, and cultural factors that influence both men and women's sexual expression as individuals and in intimate relationships.

Attitudes and Beliefs

Personal attitudes and beliefs both reflect and influence sexual expression (Waite et al., 2009). Not surprisingly, negative beliefs about sex are associated with lower sexual desire, which may result in lower levels and poorer quality of sexual activity (DeLamater and Sill, 2005). As for many behaviors, beliefs about sex vary by gender and age-group among older adults. Women tend to hold more conservative beliefs about sex than men, and older people have more conservative beliefs than younger people, especially in the case of agreeing or strongly agreeing that sexual ability decreases with age (Waite et al., 2009).

Beliefs about masculinity and femininity also may shape sexual expression (*see* Femininities and Scripts of Masculinity, this volume). Prior work has argued that heterosexual expression is another way in which men and women 'do gender' (Connell, 1987; West and Zimmerman, 1987) and recent empirical work suggests that this continues into older ages (Cornwell and Laumann, 2011; Lodge and Umberson, 2012). The ways in which men and women engage in sexual expression may reflect and reinforce ideas of men as strong, virile, and dominant over women, and of women as passive recipients of male sexual desire. In particular, this perspective emphasizes penile performance and vaginal intercourse (Burgess, 2004). Changes in sexual function may threaten these notions, particularly in light of messages that sexual expression in older ages should be resemble that in younger ages (Marshall, 2012). The distressing nature of sexual problems has been highlighted in both quantitative and qualitative studies (Hirayama and Walker, 2011; Lodge and Umberson, 2012). Recent work has found that a partner's sexual problem is associated positively with depression for both men and women (Hirayama and Walker, 2011). Qualitative studies also highlight that sexual problems are

distressing for both men and women in gendered ways. For example, in study of older married couples, men reported embarrassment when faced with erectile dysfunction, whereas their wives reported blaming themselves for not being physically attractive enough for their husbands (Lodge and Umberson, 2012). The authors, however, found that these concerns were confined largely to younger couples in the survey (ages 50–69 years), whereas older couples (ages 70 years and older) emphasized emotional rather than sexual intimacy. Although prior work has not examined specific individual beliefs and affinities to notions of masculinity and femininity, it is likely that these also influence sexual expression across older ages.

Finally, religious beliefs and associated behavior may shape sexual expression. Religious beliefs and affiliations shape the nature and context of 'appropriate' sexual expression. Although little work has explicitly examined religious beliefs at older ages, there is evidence that the relationship between religious beliefs and behaviors vary by partner status. One recent study found that religious attachment is not related strongly to sexual frequency or satisfaction among the married, but rather is an important predictor of these same outcomes for women (but not men) without partners (McFarland et al., 2010). Another recent study examining sexual inactivity found that Catholic identity is positively associated with sexual inactivity for women but not men (Karraker and DeLamater, 2013), which may reflect Church doctrine about the procreative purpose of sexual activity and stronger ties between religious affiliation and behavior for women than men. Indeed, work examining younger samples that religion is more influential for women's sexual behavior than men's (Rostosky et al., 2004).

Cohort Effects

Sexual expression also is shaped by cohort experiences. A cohort perspective stipulates that individuals born in the same time period and experience certain historical, cultural, institutional, and technological events together carry these experiences with them across their lives (Elder and O'Rand, 1994). The aging of Baby Boomers (those born between 1946 and 1964) often is cited as a motivation for the study of sexuality in older age (Lindau et al., 2007; Karraker and DeLamater, 2013), but what does the future hold for this cohort? Compared with older cohorts, this cohort has experienced better medical care throughout the life span, which likely translates into healthier older ages, facilitating continued sexual activity. Many of the Boomers also experienced the important technological innovation of oral contraceptives around the formative ages of adolescence and young adulthood, disconnecting sexual activity from reproduction. Expansions in education likely contributed to more liberal attitudes about sex. These changes may result in higher levels of sexual activity in the postreproductive years compared with older cohorts. Furthermore, the rise of cohabitation as an alternative to marriage (Brown et al., 2006) also suggests changing contexts for sexual activity for more recent birth cohorts. Changing relationship contexts for sexual activity, including the extent to which they are monogamous, in turn may increase risks for sexually transmitted infections at older ages. In addition, if more recent cohorts place greater emphasis on continued sexual activity in relationships, sexual inactivity may be an increasingly important mechanism selecting individuals into and out of relationships. Finally, greater female agency as a result of experiencing the sexual revolution in the critical periods of adolescence and young adulthood (Sassler, 2010), combined with narrowing life expectancies between men and women, may result in narrower gender differentials in at least some aspects of sexual expression for younger cohorts.

This article has focused on a variety of correlates of sexual expression, but what is the relationship between age itself and sexual expression? It has been notoriously difficult to untangle the relationships among age, cohort, and period (such as the introduction of Viagra in 1998) in most studies because few studies contain information on multiple cohorts as they pass through specific historic time periods and ages. Some evidence exists that younger cohorts born in more sexually open times carry sexual repertoires and attitudes into older ages (Kontula and Haavio-Mannila, 2003). Evidence also suggests that the aging process yields more conservative attitudes about such issues as premarital sex within cohorts (Harding and Jencks, 2003), which may yield decreases in sexual expression as cohorts age, but preserve intercohort differences. One avenue for future research is to disentangle the independent forces of age, cohort, and period for sexual expression.

Directions for Future Research

Major advances have been made in understanding sexual expression among older people and its determinants in recent years, but much work remains to be done. In addition to several specific issues already discussed, this article concludes with two suggestions for future research. First, several analytic and methodological issues remain to be resolved. To what extent are associations between such factors as health with sexual expression causal, and in what direction does causation flow? Most of the prior work on the determinants of sexual expression has established associations between factors and sexual expression, but cannot establish causal order. For example, poor health may be an antecedent to sexual inactivity, its consequence, or both (Karraker and DeLamater, 2013). Health problems may create sexual problems that in turn may strain intimate relationships, further compromising health. The collection and analysis of longitudinal data documenting changes in sexual activity and its correlates can help untangle the relative importance of pathways flowing from sexual expression to health and vice versa. In addition, because much (but not all) sexual expression takes place in an intimate relationship, more work is needed on how each individual within the sexual dyad, as well as the dyad itself, influences expression. Prior quantitative and qualitative work has identified gender differences in the determinants of partnered behavior, but usually has not used data reported by each partner. Analysis of both partners characteristics and experiences may provide more direct evidence of a gendered sexual life course. More broadly, the incorporation of life-course theories often employed by scholars of aging would be productive additions to the study of sexuality at older ages.

Second, much work (including this article) has focused on variation by gender in the determinants and experiences of sexual expression at older ages; far less has focused on the role of race and class beyond including controls for such factors as race or ethnicity and education. Race and elements of class shape sexual expression earlier in the life course (Laumann et al., 1994), and it is likely that these forces persist in later life. Race and class also pattern other determinants of sexual activity, such as health (Williams, 1999; Herd et al., 2007). Furthermore, women of color and poor women (who are more likely to be women of color) are less likely to marry than those who are white or more economically advantaged (Goldstein and Kenney, 2001). This suggests that the contexts in which sexual activity occur as well as its determinants may vary jointly by class, gender, and race. One strategy to incorporate these empirical facts is to utilize an intersectional approach, which contends that researchers must account for the complex, multiple, and interdependent social positions individuals inhabit that shape opportunities and their lives (McCall, 2005). Likewise, the study of sexual expression at older ages presents exciting opportunities for social scientists at the crossroads of biological, psychological, social, and cultural forces.

Heterosexuality

Abstract

In this article, we provide a broad overview of research findings on heterosexuality, focusing on sexual practices, attitudes and sexual dysfunctions. We briefly review the theory of sexual scripts as an introduction to interpreting a wide range of findings from numerous nationally representative surveys and several smaller studies, concentrating our review on American datasets, but providing the reader with cross-cultural findings where possible.

In 1948, entomologist-turned-sexologist Alfred Kinsey published the first half of his two-part study of sexuality, *Sexual Behavior of the Human Male*. The companion volume, *Sexual Behavior of the Human Female*, came out in 1953, and readers today will probably find it difficult to recreate the shock felt by members of the American public at the time. Kinsey's work was not simply an exposé about a deviant subculture, but purportedly included a portrait of average Americans. In light of the variety of sexual expression that Kinsey discovered, he would argue that sexual orientation was a continuous spectrum rather than discrete categories, which came to be known as 'the Kinsey scale' (Kinsey et al., 1948, 1953). While Kinsey would make strong claims about the natural variability of human sexuality, he conceived of the categories that Americans used to sort people into 'heterosexuals' and 'homosexuals' as being more notional than discrete, mutually exclusive categories. Thus his work set generations of sex researchers on the path to studying social processes that define, constrain and enable heterosexual expression. In this article, we summarize the sociologically informed research on heterosexuality that developed after Kinsey, touching upon theory where it is appropriate to interpret these findings.

While Kinsey created a fundamental foundation for method and theory, many problems that beset his research still trouble sexologists today. First, eliciting reliable data that truly measure unobserved sexual practices is challenging for any sex research, in part because people may be reluctant to disclose this information to a stranger (Das and Laumann, 2010). Second, securing funding for sex research remained problematic, however, much researchers were motivated to provide an objective characterization of sexual expression, instead of portraying sexuality as one or another advocacy group would like to speak of it (Laumann and Michael, 2001). Third and finally, in order to make statements as broad and sweeping as Kinsey's, researchers require representative samples from a specified population, e.g., adult males in the United States. This was by far the greatest limitation on Kinsey's findings. While an outside committee of statisticians found his work to be outstanding compared with the scant sex research available at the time, the lack of probability sampling made the results little more than a loose assemblage of case studies (Cochran et al., 1953). Kinsey's data could not be used to make statistical inferences about America as a whole, and so while the scope of his conclusions would set a standard, his methods were lacking in statistical sophistication and rigor.

A study that comprehensively addressed this problem would not appear until the early 1990s. In the intervening period, sex studies tended to be convenience samples of idiosyncratically specified populations, which were unable to test Kinsey's claims about sexual expression in America as a whole (Ericksen and Steffen, 1994). The so-called sexual revolution of the late 1960s also arrived, further transforming America's national discourse on sexuality. However, it was not clear whether this change in discourse created any real change in sexual practices, or whether the American population was characterized by free, open, sexual experimentation, or conventional, less exploratory sexual expression. The National Health and Social Life Survey (NHSLS) was designed to answer these questions, and others, in a nationally representative sample. However, it was nearly not fielded; the American Senate voted 66–34 in September 1991 not to fund the NHSLS in favor of a 'say-no-to-sex' campaign (Laumann and Michael, 2001). The study, unfortunately at a much reduced sample size, was funded by a consortium of seven private foundations, and eventually gathered the data. The first field interviewers began interviews in February of 1992, and the investigator team eventually released the data to the public (Laumann et al., 1994).

Since the publication of the NHSLS's main findings, subsequent datasets have become available which cover countries around the world. The speed with which these datasets were produced means that many of the results can be collated to form a global picture of heterosexual behavior in our current era. Thus, although this article will focus largely on America, it will make comparisons to other countries where possible. This article will also focus on quantitative studies more than ethnographic or interview case studies, in order to provide wide-ranging descriptive information. Where no nationally representative information is available, we cite smaller studies.

Defining 'Heterosexual'

Kinsey theorized sexual orientation as a continuum, and accordingly created a scale that was calculated based on overt

sociosexual experience in adulthood. His calculations produced a score which ranged from '0' to '6' where '6' was exclusively homosexual and '0' was exclusively heterosexual (Kinsey et al., 1948, 1953; Van Wyk and Geist, 1984). Kinsey's main finding was that most people were in the middle of this continuum, meaning that 'heterosexuals' in the unambiguous sense were not the overwhelming majority in America (Kinsey et al., 1948, 1953; McConaghy, 1987; McConaghy et al., 1994). In light of his tabulations, Kinsey declared that if 'heterosexual' meant someone with exclusively heterosexual partners and desires, then nearly half of the American male population was not heterosexual (1948: p. 617).

Some would dispute these findings in subsequent studies, saying that very few Americans fall between the values 2 and 4 on the scale (Van Wyk and Geist, 1984). Others would take issue with the scale being unidimensional (McWhirter et al., 1990). Heterosexual and homosexual desire might be two separate axes, and asexuals could be individuals who were low on both dimensions, just as bisexuals were people who ranked highly on both (Storms, 1980). While these may seem like solely methodological issues, they explicitly address the nature of sexual orientation by trying to set down an acceptable way to measure it.

In the 1994 NHSLS, Laumann and colleagues proposed another way of conceptualizing sexual orientation, to show that the question 'what percent of the American population is heterosexual?' did not have a simple or singular answer. Rather than choosing among self-definition, actual sexual practice, and sexual impulses, the NHSLS team conceived of orientation as a combination of all three, that is: (1) sexual identity, or identifying oneself as 'heterosexual,' 'homosexual' or something else; (2) sexual practice, or actually engaging in genital-stimulating contact with members of the same and/or the other gender; and (3) sexual desire, or having erotic feelings toward and fantasies about members of the same and/or the other gender (Laumann et al., 1994). This is not only a 'multidimensional' definition of heterosexuality, as some have proposed (Storms, 1980), but it also acknowledges overlapping, separate domains of sexuality which intersect to create what we colloquially term 'being heterosexual.' **Tables 1** and **2** show the breakdown of these three domains using data from the NHSLS, augmented by questions from the General Social Survey (GSS) collected that same year. More than 85% of men and women reported exclusively opposite-gender partners in the past 12 months, and if one measures partners since puberty, one finds that over 90% of men and women have only had opposite-gender partners. More than 96% of men and 98% of women identified as heterosexual, and 93.8% of men and 95.6% of women reported only opposite-gender attraction. These numbers show that for the majority of Americans at the time the NHSLS was fielded, their behavior, identity, and desire was overwhelmingly heterosexual. It is difficult to say which of these criteria deserve more weightage for determining who is and is not heterosexual. More reasonably, one might argue that the label is inherently ambiguous, and therefore one cannot count the number of heterosexuals in any society.

According to the framework which was used to analyze the NSHLS, heterosexual expression is informed by what Simon and Gagnon call *sexual scripts*. Sexual scripts are the often improvised and mutually shared narratives that sexual actors use to orchestrate sexual expression, and attribute meaning to their experiences (Gagnon and Simon, 1973). Sexual scripts operate at three levels: cultural, interactional and interpersonal, and intrapsychic. Cultural scripts are collective scenarios which provide the broadest picture of acceptable sexual expression. Interpersonal scripts are shared expectations about the chain of behaviors which will occur in a particular setting and span of time. Intrapsychic scripts are motivational elements that allow an individual to grasp the meaning of their actions, and become committed to those actions. At the cultural level, scripts may appear hegemonic, but individuals are constantly renegotiating and changing sexual scripts in order to create distinctive

Table 2 Prevalence of sexual identity and sexual attraction by gender (percentages)

interpretations of particular sexual situations, especially at the interactional level (Masters et al., 2012 (Epub ahead of print)).

Heterosexual behavior is scripted to the degree that actors use scripts to decide what it is they will do in a sexual encounter, how they feel about it, and what they expect to lead up to it and follow from it. Rather than speaking of heterosexual *behavior*, scripts prompt one to speak about heterosexual *expression* as performative action, where scripts intertwine with biological impulses and feelings in generic cultural repertoires. As an example of how sexual scripts shape sexual practice, consider the order of sexual practices which are normatively appropriate in a given sexual encounter. In a nationally representative sample of over 19 000 Australians in 2001–02, researchers found that 13 combinations of sexual practices accounted for 93% of all sexual encounters – half of all encounters were intercourse accompanied by manual stimulation of the man or woman's genitals (Richters et al., 2006). Such extraordinary consistency is probably not the result of random chance, but rather testifies to the power of social expectations that both partners bring to otherwise private, intimate moments.

Also, consider the length of time between meeting a potential sexual partner, and first having sex with that person. Research from the NHSLS showed that it is very rare for this interval to be short, with only 10% of marriages and 37% of more short-term relationships having an interval of less than a month (Laumann et al., 1994: p. 239). Only 1.4% of marriages involved sex within 2 days of meeting (239), testifying to the long negotiations which usually occur between becoming acquainted and first sex, despite reigning cultural myths that sex is the result of spontaneous outpourings of desire (Dune and Shuttleworth, 2009). Courtship negotiations are, in fact, often heavily scripted, which is especially evident when scripting breaks down. For instance, gendered differences in scripts can lead to conflict between men and women over how to understand their relationship to each other at some stage of the courtship process (Rose and Frieze, 1993; Bartoli and Clark, 2006). Courtship also becomes a staging ground for intrapsychic conflicts between dating scripts; for example, American heterosexual men sometimes experience strong tensions between cultural expectations that they become emotionally invested in their female partner, while at the same time performing masculine scripts of courtship-as-conquest (Seal and Ehrhardt, 2003).

As a final note, intrapsychic sexual scripts are related to sexual attitudes, although sexual attitudes are more connected to the individual's morality. Sexual attitudes can be understood as the actor's normative orientation toward sexual conduct – their ideas about where, how, and with whom sex should take place. Like scripts, sexual attitudes also cluster within master status groups, (*Master Status* is a socially defined position, such as age, gender, or martial status, occupied by a person in society that is important in shaping his or her self-concept and life choices (Laumann et al., 1994: p. 31).), since status groups often condition group members to have relatively similar sets of attitudes and normative beliefs. Most obviously, membership in religious master status groups seems to be associated with different attitudes toward sex and procreation; Catholics are far more likely to endorse the view that sex is only appropriate for procreation, and that accordingly, sex which does not result in, or is not intended to result in children, is wrong (de Visser et al., 2007; Laumann et al., 1994). Homosexuality is only one subset of such behavior; premarital sex, oral and anal sex all fall within this class of sexual practices as well. This does not mean that Protestants will necessarily be more likely to condone homosexual practices; conservative protestant groups such as Pentacostals have continued to grow in size and influence as the Catholic church loses membership throughout the globe, and many of these churches have hard-line positions against homosexuality (Adamczyk and Pitt, 2009). By contrast, individuals with no religious affiliation seem more likely to endorse a relational view of sex, where sexuality is best-expressed in committed and loving relationships as a part of two peoples' emotional commitment to each other, or a recreational view of sex, where any kind of sex is acceptable as long as it is between consenting adults (Laumann et al., 1994, 2006). Note that it is just as possible for one's normative orientation to prohibit categorical approval *or* disapproval of certain sexual practices. Compared with any other country in the world, people in Japan are more likely to say that premarital sex is only sometimes wrong, and to avoid condemning or condoning it outright; this may be because Japanese people tend to view premarital sex as acceptable, as long as one is discreet about it (Widmer et al., 1998).

Heterosexual Expression over the Life Course

The theory of sexual scripts also holds that not every script is available to every person at any time. Actors will consider certain scripts to be acceptable for some people rather than others, and thus sexual scripts will adhere to a number of *master statuses* especially gender, race/ethnicity, age, and class (Laumann and Michael, 2001; Laumann et al., 1994). Age organizes acceptable expression because actors refer to age in order to understand what stage of life a person currently inhabits, and what would be normatively appropriate, given this stage (Mahay and Laumann, 2004). Accordingly, where a person falls in their perceived *life course* is a key factor for the social organization of heterosexual behavior.

While there are biological constraints on how soon in her life a female can bear a child, and a male can father one, cross-culturally there is no fixed interval from the onset of sexual readiness to sexual debut. In some cultures, years may pass between menarche and first child, as a matter of a woman's typical life-course trajectory, while in others, the gap between menarche and first child is fleetingly brief (Udry and Cliquet, 1982). The case of China is illustrative here, since social transformations following the cultural revolution narrowed the interval between sexual readiness and sexual debut. Premarital sex became more common for cohorts born after 1950, and the history of previous forms of social organization can be glimpsed across age cohorts of the current Chinese population.

As an illustration of how drastic this change has been, observe **Figure 1**, adapted from Parish et al. (2007). The figures show trends in premarital sex for four cohorts of urban men and women in China, which can be read in the light of China's changing political order. For men reaching age 20 between 1965

Figure 1 Trends in premarital sex (intercourse) among four cohorts of men and women in urban China. Note: Commercial = commercial sex worker or other paid sex; <1 month = relationship lasting less than a month not followed by marriage; ≥ 1 month = relationship lasting at least a month not followed by marriage; Possible fiancé = current relationship that might lead to marriage; Fiancé = premarital relationship that led to marriage. For people with multiple types of premarital sex, only their shortest-term relationship was counted.

and 1985, use of prostitutes almost vanished, due to Mao's heavy persecution of this practice. However, use of commercial sex workers reappears after 1985, making up almost a fifth of all premarital sexual experiences for men. For women in the 1955 cohort, premarital sex was almost exclusively with one's betrothed, but this proportion declines to about a third of all premarital sexual experience for the 1995 cohort. The authors point out that for all cohorts, men encountered a greater variety of sexual partners than women, indicating the reemergence or persistence of a gendered double standard for sexual behavior.

As this cultural transformation was underway, improvements in childhood nutrition and socioeconomic development affected Chinese ontogeny. Chinese diets improved in quality, quantity, and variety for both urban and rural dwellers (Popkin, 1994; Popkin et al., 2001), and age at start of puberty in China fell from 15.9 to 13.6 years (Parish et al., 2007). These developments paralleled trends seen elsewhere and at other times. In Europe, from 1795 to 1981, the age at menarche fell by 2.3 months per decade; in the United States, age at menarche fell from 14.75 years in 1877 to 12.8 years in 1947, eventually leveling off to remain stable at this age (Wyshak and Frisch, 1982).

The United States is also continuing to undergo transformations in age-appropriate sexual scripts, long after the so-called sexual revolution apparently slowed. As years of educational training become continually lengthened, more and more of Americans' lives are spent in college and postgraduate training (Morgan, 2005), leading to the emergence of new stages in the American life course (Arnett, 2000). Regarding sexual expression, one of the cultural innovations occasioned by this expansion of American higher education system is the so-called hookup culture. Hookups are defined by several key characteristics. First, hookups are not part of a long-term relationship; typically neither partner enters into the sexual union with any promise that this encounter will lead to some future romance. Second, hookups take place without any guarantee about which sexual practices will take place, or what communication will continue afterward (Bogle, 2008; Epstein et al., 2009; Garcia and Reiber, 2008; Owen et al., 2010). Third, hookups generally take place within the setting of college parties, and usually involve the influence of alcohol (Garcia and Reiber, 2008). Currently, no nationally representative studies of colleges have attempted to grasp the social dynamics of hookups, but several smaller studies have provided suggestive results (Garcia and Reiber, 2008; Owen and Fincham, 2011; Armstrong et al., 2010; England et al., 2007). For instance, hookups only seem to include sexual intercourse about a third of the time, and individuals who participate in hookups are not necessarily promiscuous – in one study

by senior year 40% of students who had ever 'hooked up' had experienced three or fewer hookups (Armstrong et al., 2010; England et al., 2007). Male and female respondents who report seeking or experiencing a hookup generally say that they do not want a 'serious' relationship, because they know that after college they will leave their current residence and will have to seek employment elsewhere. They know that their sexual partners are in the same situation, and the practical difficulties of solidifying a long-term sexual relationship, such as a marriage, make hookups a more appealing alternative as an institutionalized way to experience sexual companionship, without forming strong bonds which may eventually be strained by the exigencies of the labor market (Bogle, 2008). Hookup culture is also fomented by the fact that many colleges are relatively small and homogeneous communities, making assortative mating and the decoding of sexual scripts easy (Bogle, 2008). Hookups therefore represent a new concatenation of sexual scripts in the service of sexual expression, ushered into existence by changes in many Americans' life courses.

However, in both China and the United States, it is not yet clear whether or not these cultural transformations will permanently undermine traditional forms of sexual expression. The notion of youth as a period of sexual experimentation is often joined to a normative expectation that young people will subsequently settle into the conventional roles which culturally characterize a later stage of their life course. In the United States, 9% of men report that their first sexual encounter was with another male, but the number of men who settle into long-term homosexual partnerships is far lower (Laumann et al., 1994), indicating the power of dominant scripts to constrain and channel sexual desire into dominant, normative structures.

In general, heterosexual expression in the United States is characterized by punctuated equilibria of short periods of partner-seeking and partner turnover, followed by longer periods of stable sexual partnerships with no turnover and limited or no concurrency of sexual partners (Laumann and Michael, 2001; Das et al., 2011). In other words, for most of their lives, social actors are not active participants in a sexual marketplace.

Tables 3–7 show the lifetime number of sexual partners for each gender in the United States, with estimates derived from the NHSLS. American women report a median of only two lifetime sexual partners, and men report six. The disparities between men and women could be the result of higher sexual partner turnover in homosexual circles, larger pools of potential partners for men due to their greater geographical mobility, or even different definitions of sex between men and women (men are slightly more likely to consider manual stimulation to be sex (Sanders and Reinisch, 1999). The 2002 National Survey of Family Growth (NFSG) found that men over 30 report six to eight lifetime partners, and that women report only four (Mosher et al., 2005). Neither estimate confirms the stereotype that Americans are promiscuous, nor does it suggest that America, following the sexual revolution, completely eliminated scripted constraints on sexual expression.

Furthermore, the vast majority of people in the United States population reports only one sex partner a year. More men than women report two to four sex partners annually, but only 5% of men and less than 2% of women report more than five. Furthermore, it seems the modal frequency of sex for both men and women is only a few times a month, and sexual duration is only usually about 15–60 min per event. Thus the role of partnered sex in American respondents' lives is actually relatively small, as measured by time spent. Sexual partnership, of course, plays a much larger role in other respects, but sex is so heavily organized by sexual scripts that the real probability of a 'free-for-all' of sexual expression is surely very small. In fact, spikes in the number of sexual partners for American men almost always takes place outside of marriage, and higher rates of coitus among African-Americans is likely the result of lower marriage rates (Mosher et al., 2005).

Table 3 The vast majority of the US population aged 18–59 has only one sex partner within a year

	Number of sex partners in the past 12 months (%)			
	0	*1*	*2–4*	*5+*
All	11.9	71.1	13.7	3.2
Men	9.9	66.7	18.3	5.1
Women	13.6	74.7	10.0	1.7

Table 4 The median number of sex partners since age 18 is 2 for women and 6 for men

	Number of sex partners since age 18

Women	2.5	31.5	36.4	20.4	6.0	3.2	2

Heterosexual Practice, and the Spread of Sexually Transmitted Diseases

The human immunodeficiency virus (HIV)/acquired immunodeficiency syndrome (AIDS) crisis was the principal reason that sex research again achieved national prominence in America. If

Table 5 Americans do not have sex all that frequently, and not for that long a duration when they do have sex

	Frequency of sex in the past year				
	Not at all	*A few times a year*	*A few times a month*	*2–3 times a week*	*4+ times a week*
Men	9.8	17.6	35.5	29.5	7.7
Women	13.6	16.1	37.2	26.3	6.7

	Duration of last sexual event (%)		
	Less than 15 min	*15–60 min*	*60 or more minutes*
Men	11.0	69.3	19.7
Women	14.7	70.5	14.8

Table 6 A large majority of Americans do not find many sex practices very appealing

	Percentage saying practice is 'very appealing'		*Percentage engaged in practice in last event*		*Percentage engaged in practice ever*	
	Men	*Women*	*Men*	*Women*	*Men*	*Women*
Vaginal intercourse	83.8	76.8	94.6	95.6	95.0	97.0
Watching partner undress	47.8	26.8				
Receiving oral sex	45.0	28.8	27.5	19.9	78.7	73.1
Giving oral sex	33.5	16.5	26.8	18.8	76.6	67.7

By frequency of sex in past 12 months			
None	39.5	36.7	23.8
1–2 times per year	45.6	32.8	21.6
2–3 times per month of once/week	59.2	29.3	11.5
2–3 times per week	69.0	25.1	5.9
4+ times per week	64.5	22.0	13.6

Kinsey's picture of a continuum between heterosexual and homosexual behavior was the case, then it was plausible that HIV could readily jump from the stigmatized 'high-risk' homosexual population to the heterosexual mainstream. As a side-effect of research into sexual practice related to sexually transmitted disease (STD) transmission, research into a wider variety of sexual practices became more politically legitimate, and sex researchers were able to develop a broader understanding of sexual practices.

Delineating what is and is not 'heterosexual' practice is difficult, in part, because of practices which some heterosexual couples find pleasurable in conjunction with intercourse, but which have nothing to do with genital stimulation, such as kissing or hugging. Masturbation might also be counted as a kind of heterosexual expression, if it takes place in the context of heterosexual fantasies, or in the presence of a heterosexual partner. (According to the NHSLS, 58% of women report that they do not masturbate at all, compared to only 36% of men (Laumann et al., 1994: p. 83), numbers which are still remarkably high given several social movements in American society aimed at reducing the incidence of masturbation, including circumcision (in a case of historical irony, circumcised males are actually more likely to masturbate; Laumann et al., 1997).) For the sake of parsimony, we will focus on only four types of heterosexual practice here: vaginal-penile intercourse, cunnilingus, fellatio, and anal sex. The ways in which cultural scripts orchestrate these practices, shape the enjoyment actors derive from them, and the implications of the social organization of sexual practice for the transmission of STDs will be briefly reviewed in this section.

By and large, the same picture of conventional heterosexual expression in America holds for sexual practices. Three-quarters of American men and women report some lifetime experience with oral sex, but only one-quarter report that it took place during their last heterosexual coupling (Laumann et al., 1994: p. 101). It is probably worth resuming a brief historical discussion here. Based on a cohort analysis from the NHSLS, oral sex seems to become widely practiced in the United States in the 1920s, long before the sexual revolution. It appears that nationwide rates remained relatively low (less than 70% of the sexually mature population) until the early 1950s, when rates of lifetime experience with oral sex climb to 90% (Laumann et al., 1994: p. 104). For cohorts who reached sexual maturity after the early 1950s, oral sex became a readily available and relatively unstigmatized technique for obtaining sexual pleasure.

Rates of anal sex are even lower in America, with 26% of men aged 18–59 reporting any anal sex with a woman in their lifetimes, and only 9% experiencing heterosexual anal sex in the past year (Laumann et al., 1994: p. 107). Later studies employing the 2002 NFSG report higher rates: approximately 38% aged 18–44, which could be due to the exclusion of older respondents (Mosher et al., 2005). The rate of heterosexual anal sex seems to diverge according to master

status group membership as well: highly educated persons, respondents with no religious affiliation, and Hispanic men all report higher rates of anal sex (Laumann et al., 1994: p. 109). Regardless of subdivisions of the sample, the statistics suggest that anal sex is much rarer than oral sex among American heterosexuals.

Compare the numbers above with rates of penile-vaginal sex in America. According to the NHSLS, over 95% of men and women in the United States report some lifetime experience with heterosexual intercourse (Laumann et al., 1994: p. 97). Even more noteworthy: this rate did not appear to vary by master status, except younger age cohorts which have not had as much time to accumulate partners. Numbers from the NFSG are similar, reporting 97% of men and 98% of women between the ages of 25–44 ever having had penile-vaginal intercourse (Mosher et al., 2005). At last sexual contact, individuals with opposite-sex partners were also overwhelmingly likely to say they engaged in penile-vaginal penetrative sex (95% of men and 96% of women; Laumann et al., 1994: p. 100). This finding is also stable across all master statuses, which helps us to understand why the word 'sex' is often used by English speakers as if it were synonymous with this specific sexual practice.

One might expect that sexual expression of all kinds gradually declines as people age sexual expression of all kinds gradually declines and sexual impulses weaken. Recent analyses of the sexual life of America's older population suggest that this may not be the case. The National Social Life Health and Aging Project (NSHAP), which fielded its first wave in 2005, found that over 60% of men between the ages of 66 and 70 who report being in good health have had sex in the past year, and that more than 35% of women in this age range who are in good health report sex in the past year (Lindau et al., 2007). The lowest rates were among older persons (81–85), in poor or fair health, and even then, more than 10% reported sex in the past year. Partnership was also strongly associated with sex in the past year: among those who were not in a romantic relationship, only 22% of men and 4% of women reported being sexually active in the past 12 months. This may help to explain why older women were overall less likely to have had sex in the past year, since women were less likely to be partnered. Recall that if most sex takes place in the context of monogamous relationships, as long as physical function continues to permit sexual performance, then sexual expression will continue, and perhaps even thrive.

Paradoxically, for all of this apparently conventional sexual expression in mutually exclusive sexual relationships, STDs are common in America. **Table 8** shows the prevalence of STDs by gender and number of sex partners for the American population using estimates derived from the NHSLS. Nine percent of men and 5% of women report gonorrhea in their lifetimes, and about 6% of women report genital warts. Taken together, about 16% of men and 18% of women have ever had a sexually transmitted infection, and the incidence of STDs seems to be a function of the number of sexual partners that they have (Laumann et al., 1994: p. 425). It is noteworthy that for every level of risk as indexed by numbers of lifetime partners, women are almost twice as likely to report having had an STD. This disparity in likelihood of contracting STDs by gender may be explained, in part, by the fact that women's partners are more risky in the sense of their having had more sex partners than men's partners who, being women, have a lower likelihood of having had multiple partners. There may also be physiological reasons which leave women more vulnerable to STD infection than men.

Table 8 The Prevalence of STDs in the United States and the risk factors for those diseases; one in every six men and women reported having an STD at some point in their lives, and those with more partners are dramatically more likely to have a bacterial or viral infection

	Respondent's gender (%)		*Respondent's number of sex partners since age 18 (cases per 1000)*					
	Male	*Female*	*0*	*1*	*2–4*	*5–10*	*11–20*	*21+*

Any viral	5.4	9.0	11	17	50	98	159	177
Any STD	15.9	17.8	11	43	104	234	338	404

[a]Nongonococcal urethritis.
[b]Pelvic inflammatory disease.

These high rates of STD infection have also led some to posit a 'core' and 'periphery' model of sexual networks. At any given time, there may be some individuals who are highly connected by sex to other, similarly highly connected individuals, who form a core of sexual contact with high risk of STD transmission. Beyond this core is a periphery of disconnected persons who have relatively few sex partners, and whose sex partners are rarely connected to anyone else. By one account, higher rates of STD infection among African-Americans may be due to the fact that the African-American core is not as separated from the periphery, and thus the probability of a new tie forming between core and peripheral members is more likely for blacks than for whites, making it easier for STDs to escape the core (Laumann and Youm, 1999). A comparable network-based study of sexuality in China found that Chinese women (well over 90% of whom have had only one partner in their lifetime) have a higher rate of Chlamydia infections than men, even though men report more partners and make much more use of commercial sex workers (Parish et al., 2003). Connecting women to their male partners' sex networks sheds light on this issue.

The NHSLS also shows that master statuses are powerfully predictive of partner choice. Observe **Table 9**, which provides a breakdown of homophilous (same-status) partnering according to the self-reports of respondents for four relationship categories, in descending order of purported commitment: marriages, cohabitations, longer-term partnerships, and short-term partnerships. Partner choice requires a certain amount of shared sexual scripts and outlooks on life in order for both actors to communicate what they expect from a partner, and

Table 9 Percentage homophilous by relationship type (only marriages and cohabitational relationships that began in the last 10 years)

Type of homophily	Type of relationship			
	Marriages	Cohabitation	Long-term partnerships	Short-term partnerships
Racial/ethnic	93[a]	88	89	91
Age[b]	78	75	76	83
Educational[c]	82	87	83	87
Religious[d]	72	53	56	60

[a]Indicates weighted percentage of marriages that began within the past 10 years and involved two people of the same race/ethnicity. Cases in which either partner was reported as Native American or other or had missing data were omitted.
[b]Age homophily is defined as a difference of no more than 5 years between partners' ages.
[c]Educational homophily is defined as a difference of no more than one educational category. The categories are less than high school, high school, vocational training, 4-year collegeor more.
[d]Cases in which either partner was reported as 'other' or had missing cases are omitted.

to tacitly understand that there is some sexual attraction between them, and as we have already argued above, these scripts are organized around master status categories. Partner choice also often occurs in the context of other, non-partner confidants and acquaintances, who may ask the respondent to explain why it is that they are seeking to initiate a relationship outside their status group (Laumann et al., 1994). Thus we might predict that lower-investment relationships would show less status-homophily than higher-investment relationships, since longer contact with a partner often means introducing that new person into the respondent's network of kin and friends, which are also, often, homophilous (McPherson et al., 2001). A quick look at the numbers reveals that this is not the case. Partnerships at every level are highly homophilous on race and education, with about 90% of partnerships of any kind being homophilous with regards to race. More recently collected data from the United States census confirms that less than 10% of African-Americans marry outside their race (Fryer, 2007). Coupled with the findings on African-Americans' sexual networks above, and taking into account the intersection of race, education, religion and age, the possibility of a sexually transmitted disease outbreak in America that crosses into and permeates every master status group is fairly low.

Sexual Dysfunction and Sexual Well-Being

Data from the NHSLS and NSHAP show that sexual dysfunctions are common among younger and older adults (Lindau et al., 2007; Laumann et al., 2008). In **Table 10**, we can see that 37% of American men over the age of 57 suffer from some degree of erectile dysfunction, and 28% experience premature ejaculation. Among women, the most common form of sexual problem is lacking interest in sex (43%) followed by having problems with lubrication (39%), and not achieving orgasm (34%). NHSLS data also showed that rates of sexual dysfunction are higher for women than men at any age (Laumann et al., 1999).

Table 10 Prevalence of sexual dysfunctions among older Americans, aged 57–85

Variable	Respondents (number)	Age group (%)		
		57–64 years	65-74 years	75-85 years
Lack of interest in sex				
Men	881	28.2	28.5	24.2
Women	504	44.2	38.4	49.3
Difficulty getting or maintaining an erection				
Men	874	30.7	44.6	43.5
Difficulty with lubrication				
Women	495	35.9	43.2	43.6
Climaxing too quickly				
Men	860	29.5	28.1	21.3
Inability to climax				
Men	866	16.2	22.7	33.2
Women	479	34.0	32.8	38.2
Anxious about performance				
Men	873	25.1	28.9	29.3
Women	500	10.4	12.5	9.9

Data gathered from the Global Study of Sexual Attitudes and Behaviors (GSSAB) also suggest that sexual dysfunction is common around the globe (Laumann et al., 2005). In Korea, 33% of male respondents aged 40–80, reported problems with premature ejaculation, and 32% had trouble getting or maintaining an erection. Thirty-seven percent of Korean women reported a lack of pleasure in their sexual experiences, and 32% reported an inability to reach orgasm (Moreira et al., 2006). Other data from the same study found that 43% of men and 49% of women throughout the world report at least one sexual problem (Moreira et al., 2005; Laumann et al., 2005).

Just as sexual scripts help social actors understand sexual performance, scripts inform the meaning of sexual dysfunction. While some respondents consider a lack of sexual interest to be 'a problem,' others, who understand losing interest in sex to be a natural, and perhaps even desirable part of aging, may not feel as troubled. Recall the low frequency of sex even within marriage: the overall good functioning of a long-term partnered relationship does not hinge on coital frequency or satisfaction alone, and other benefits such as companionship and social support may keep both partners happy in their current state of affairs, without a strong sexual component to their relationship.

Consider these GSSAB data from Korea. While both America and Korea report similarly high levels of sexual dysfunction at older ages, Korean men and women are less likely to report their conditions as bothersome. Furthermore, only 5% of men and 3% of women have been asked by their doctor about their sexual lives (Moreira et al., 2006). Globally, East Asian men are the least likely to seek help for their sexual lives (6.5%) while South-East Asian men are most likely (22.5%; Moreira et al., 2005). This difference in rates seems to be attributable to ideas about

the relationship between sexual function and aging: that sexual ability does decline as one ages, and so there is nothing 'abnormal' about being unable to have sex, or being uninterested in it.

Data from the GSSAB also provide us with a window into global rates of satisfaction with one's sex life. Laumann and colleagues performed a cluster analysis on individual-level data gathered from 29 countries, and clustered those respondents according to their satisfaction with their sexual lives, grouping them by country (Laumann et al., 2006). Three clusters emerged which could be ranked ordinally by the average amount of satisfaction with their sex lives. Table 11 shows the results. We can see that the 'high satisfaction' cluster contains mostly Western, industrialized countries such as Australia, Canada, and Spain, while the 'low' cluster comprises mostly East Asian countries. Again, we should be cautious about interpreting these results since while East Asian peoples may be less satisfied with their sexual lives, this does not have to reflect on their happiness with their spouses. There may be other cultural factors which make long-term heterosexual partnership in East Asia particularly burdensome for one gender or the other, but these data do not speak to that issue.

Conclusion

In this article, we have not focused on biological or psychological factors that may underpin the frequency or patterning of heterosexual expression, but that does not mean that we believe that sociological factors simply override them. Neither do we consider biological or psychological accounts of sexuality to be overly simplistic, but rather the opposite, that they involve

Table 11 Four aspects of subjective sexual well-being arranged by country and gender vertically, arranged by cluster membership horizontally; cells contain percent of persons responding positively in each of the four domains

systems of nearly overwhelming complexity. Sexual preferences, desires, and resilience to sexual infection or dysfunction are all apparently enmeshed in biological and psychological developments which can originate in the uterine environment (Udry, 2000; Udry and Talbert, 1988), and individually based experiences throughout childhood, adolescence, and adulthood. Going forward, we need to broaden our theories to understand more thoroughly where and how the biological, the psychological, the social, and the cultural intersect and interact to create the observed patterns of sexual expression.

Heterosexuality in Africa

Abstract

Ways of understanding sexuality in Africa have deep colonial roots. In classical anthropology – itself an aspect of colonialism – 'African sexuality' was studied as an aspect of marriage, family, and kinship. With the onset of the HIV/AIDS pandemic sexuality in itself emerged as a field of study, however, closely linked to risk, disease, and danger. Critical of these assumptions, postcolonial scholarship has introduced broader approaches to studies of sexuality. These approaches include a new focus on sexual pleasure as part of 'being African the modern way,' for men as well as for women.

One cannot talk about sexuality in Africa without talking also about colonialism. Ideas and conceptualizations of sexuality in Africa were conceived in the minds of Western missionaries and colonialists, colored by their ideas of morality and marriage. From the very first encounters of European travelers, missionaries and (later) colonial civil servants with Africans, 'African sexuality,' male and female, was understood to be 'naturally heterosexual.'

In the late nineteenth century, the hey-day of colonialism when Africa was divided between European powers (cf the Berlin Conference 1884–85) homosexuality was generally perceived as a product of an overdeveloped, decadent urban society, and thus not applicable to Africa. Heterosexuality, on the other hand, was understood as the healthy and natural state of affairs. At the time of colonization, according to Marc Epprecht, Africans figured significantly in debates within Europe about the meaning of civilization and of virility versus decadence. "Since the prevailing prejudice was that Africans were uncivilized and close to nature, by definition they could not be decadent or exhibit social traits and behaviors that were assumed to come with a sophisticated level of culture" (Epprecht, 2013: 59). Due to African peoples' close relationship with nature, they were presumed to be 'ruled by instinct and culturally unsophisticated' for which reason they "had to be heterosexual, [their] sexual energies and outlets devoted exclusively to their 'natural' purpose: biological reproduction" (Murray and Roscoe, 1998: xi). This colonial construction of Africans as naturally heterosexual has repercussions even today; actually it is only in the very last decade of the twentieth century that these colonial ideas of sexuality in Africa have started to be challenged.

Because of the massive impact of colonial ideas on the ways in which sexualities in Africa have been and still are conceptualized, by Western development agencies as well as by Africans themselves, in the first section of this article some of these ideas – their background as well as their characteristics – will be presented. With the HIV/AIDS pandemic a new wave of research on sexuality in Africa was set in motion, quite a lot of it rooted in colonial ideas, as further discussed below. This new focus on sexuality/sexualities in Africa has, however, also been a breeding ground for postcolonial critique and alternative analytical approaches, based less on colonial assumptions, and more on investigations into sexual relations as experienced by African men and women. In the second section of the article some findings from this new research will be presented, still with a focus on heterosexuality, even if a basic finding of this line of research is that a clear dividing line between heterosexuality and homosexuality cannot possibly be drawn. Even men and women, who practice and enjoy same-sex relationships, will very often also be involved in a reproductive heterosexual relationship: as a human being you should contribute to the continuation of your lineage (Murray and Roscoe, 1998).

Section I: Colonial Ideas of 'African Sexuality'

In classical anthropology – itself an aspect of colonialism, in as far as British, French, and Portuguese anthropologists were posted in the colonized territories more or less on behalf of the colonizing powers, and sharing their mindset regarding notions of morality and marriage – sexuality was studied as an aspect of marriage, family, and kinship (Spronk, 2014). Sexuality was, as already noted by Murray and Roscoe (1998), perceived as a means to reproduction. Generally speaking, sexuality – always and without question seen as heterosexuality – was synonymous with marriage, colonial and missionary campaigns being concerned about forms of marriage, i.e., that marriage should be monogamous and permanent, as prescribed by Christianity. Aberrations like polygamy, frequent divorce, bride price, and early marriage were condemned. Missionaries fought an everlasting battle defending a Christian, European conception of family and marriage, a two-generation family based on monogamous marriage (father–mother–child). This in spite of the fact that – as has been explained by postcolonial scholars such as Niara Sudarkasa (1996) – African family forms are often differently constructed, more along lines of consanguinity over several generations (grandparent–parent–child relations, and relations between siblings) than along lines of conjugality (husband–wife relations). At the same time it should be noted that this consanguinity is not necessarily biological, it may also be ascribed (Nzegwu, 2004).

Sexuality, Morality, and HIV/AIDS

Missionaries and colonialists defended a Christian morality, linking sexuality to marriage in ways which were not

 http://dx.doi.org/10.1016/B978-0-08-097086-8.35039-5

necessarily in tune with African mores. As early as 1987 Nici Nelson noted, based on fieldwork among women beer-brewers in Mathare Valley in Nairobi, that "Christian philosophy has always made a separation between body and spirit: things of the body (sexuality?) are valued less than things of the spirit. … [The] fear of women's unbridled sexuality has continued through the Christian era … In Africa this division between the flesh and the spirit into immoral and moral does not seem to exist" (Nelson, 1987: 235).

It was only with the onset of the HIV/AIDS pandemic in the last part of the twentieth century that sexuality in itself emerged as a field of study. As said by Sylvia Tamale, it is the HIV/AIDS pandemic which has 'flung open the doors on sexuality' (Tamale, 2005a). From an African point of view "it has forced into the open the myths and secrets in relationships and identities that are often silenced or taken for granted" (Tamale, 2005a). In more general terms, the global onslaught of HIV/AIDS with Africa as its epicenter has "engendered a profound re-medicalization of African sexualities" (Tamale, 2011: 17).

Western family ideals and Christian morality are however at play, even in medicalized and demographically oriented approaches, as, for instance, in the influential and oft-cited study by demographers John Caldwell et al. (1989), where they come to the conclusion that the basic evil behind HIV/AIDS is female promiscuity, or 'permissiveness,' indicating that "in Africa having sex is as simple and straightforward as eating and drinking" (Caldwell et al., 1989: 195). This statement has been criticized, and rightly so: very often in African societies sexuality is strictly regulated. But since these restrictions are likely to be different from the ones which Caldwell et al. expect to find, they presume restrictions do not exist. What Caldwell et al., most of all, see missing is the ideal of female chastity, a core value of Christianity from Virgin Mary onwards. Virgin Mary even managed to become a mother without having sex; second best is to be a mother having sex only with your husband: sex (for women) as a means to procreation. Female sexual activity beyond marriage and procreation is not supposed to take place. If, nevertheless, it does take place – as happens in Africa, according to the studies on which Caldwell et al. base their argument – this (by the colonial mindset) is seen as the root of evil. In the nineteenth century the evil let loose by sexual promiscuity – as pointed out by Sander Gilman (1989) – was often syphilis, a gruesome disease caused by excessive and immoral sexuality. In the present day, in the context of HIV/AIDS (which is the context in which Caldwell et al. write their paper) a new gruesome disease caused by sexual lasciviousness and lack of sexual morality has taken over.

A further consequence of this view of sexuality – in direct continuation of colonial approaches – is that rather than a source of pleasure, sexuality is seen as connected to risk and danger, closely linked to disease and death. This risk-and-danger approach to sexuality is still often found in development contexts – one needs only to think of development acronyms connected to sexuality, such as GBV (Gender Based Violence), FGM (Female Genital Mutilation), and HTP (Harmful Traditional Practices).

Colonial Constructions of Masculinities and Feminities

"Researching human sexuality without looking at gender is like cooking pepper soup without pepper" (Tamale, 2011: 11). Sexuality and gender are closely interlinked. Thus part of colonial ideas of African sexuality are colonial ideas of masculinity and femininity. Just as colonial ideas of sexual morality were extensions of sexual morality in the colonial mother countries, colonial ideas of masculinity and femininity were based on European middle class ideals of a male breadwinner and a female housewife. The woman as housewife is, however, a fairly recent European creation. In the Middle Ages European women were active in urban crafts, they could be members of guilds, and in agriculture women always had central roles. According to Veronika Bennholdt-Thomsen "Housework as performed by housewives does not represent a set of tasks which women have always carried out because of some natural predisposition, but is the product of a particular history. … [The housewife] was created – by the church, through legislation, medicine and the organization of the workforce (protective legislation, the 'family wage')" (Bennholdt-Thomsen, 1988: 159).

'Housewifization' in Europe was the result of a specific historical process. Nevertheless, this European model was now the model to be imposed on Africa: in colonial schools girls were instructed in cooking and sewing – in order to become appropriate wives for the new class of educated African men, trained as clergymen or clerks. In Mozambique (like elsewhere in Africa) this pattern of male breadwinner/female housewife was continued, but also subverted. Continued in terms of men being sent off to wage work (often on a migratory basis, far from home), subverted in terms of women – officially housewives – in actual fact feeding themselves and their children from their work on the land. The idea of a 'family wage' – wife and children living from the salary of the male breadwinner – was never applied.

In Mozambique for the Portuguese colonial power inducing (or forcing) the men to work was part of the civilizing mission. The image of the lazy African is the point of departure; work as such has a civilizing effect, and the repression of idleness is a goal in itself 'dignifying and uplifting the native through the work' (*Governador Geral de Moçambique*, in *Boletim Geral das Colónias* 1948). This line of argument seems only valid for men, however. As for women, the opposite seems to be the case. For women a heavy workload is an indication of subordination, the civilizing mission being to lift it off her shoulders, in order to enable her to devote herself to housework. "Development goes in the direction of leaving the bulk of agricultural work to the man. Also in Africa the woman shall become the queen of the home: *a Raínha do lar*" (da Silva Rego, 1960: 26). Civilization thus also included the well-known division between public and private spheres, with the husband 'the natural head of the family' as worker and breadwinner, and the wife and mother as 'queen of the home.' This is how things worked – or were supposed to work – at the level of ideology. In practical terms Portuguese colonialism was indeed based on women's productive work in family agriculture, feeding the family while the men were away on forced or contract labor. "Colonial exploitation of Mozambican wage labor was

conditioned by salaries being kept very low, as male workers' families were supported through women's work on the land" (Arnfred, 2011: 123).

An additional problem with the 'queen of the home' ideology is that it naturalized women's procreative capacity, and restricted their role as mothers to the private sphere. In this way, the carpet was pulled from under the feet of women, particularly in matrilineal northern Mozambique, who took pride in their role as mothers, not in the private context of nuclear male-headed families, but in powerful positions as lineage elders. But power based on maternity and fertility is not recognized in civilized Christian contexts, where fertility is trivialized as a function of nature, and maternity is reduced to the education of children in the seclusion of the patriarchal family.

Yet another aspect of women's lives, also not accepted in its own right in Christian/colonial thinking, is sexuality. The general attitude of the Portuguese colonial power was a strong condemnation of female initiation rituals, because of their focus on the education of female sexuality; it should be noted here that female initiation rituals mark the transition from young girl to adult woman, and that female genital cutting was never part of initiation rituals in Mozambique. Nevertheless, the rituals of female initiation were considered by the Portuguese colonialists as well as by the Catholic church as "immoral and offensive to the human nature" (Medeiros, 1995: 5), and also the Protestant mission saw customs relating to female sexuality as so 'vile and immoral' that they could only be described in Latin as a kind of medical journal for only doctors and professionals to read (Junod, 1912/1974: 176).

African Sexuality?

The term 'African sexuality' has heavy colonial overtones; it rings of stereotypes and prejudice, often presented as science, like in the case of Caldwell et al. discussed above. 'African sexuality' is a broad generalization with negative connotations. Nevertheless, postcolonial feminist scholars have started to take it on board, aiming to turn its negative connotations into something else: Sylvia Tamale's (2011) volume of writings on sexualities in Africa, almost exclusively by Africa scholars (and poets) is titled: 'African Sexualities.' In this book Tamale sets up a program for "rewriting and rerighting African Sexualities" (Tamale, 2011: 22), and the book certainly is a rewriting: dozens of articles rooted in experience of African men and women, and analytical concepts tuned to African social realities – much unlike the colonial approaches outlined above. Importantly, in this context, from these points of view (experiences of Africa men and women) sexuality is no more reduced to risk and danger: pleasure is part of the picture, as well as identity and power. And sexuality is not reduced to heterosexuality.

But what about the generalization? Africa is a huge continent – is it possible to talk of 'African sexualities' even in a positive sense? The position of Marc Epprecht is that yes, "the idea of African sexuality contain important grains of truth" (Epprecht, 2013: 65). In spite of early accounts of 'African sexuality' by colonial travelers and traders being "frequently exaggerated, sensationalized, judgmental and imbued by error … they nonetheless documented a basic truth: African societies tended to place an extremely high value on heterosexual marriage and reproduction" (Epprecht, 2013: 57). Epprecht however also points out that far from being non-existent or 'un-African' as claimed by certain African presidents, same-sex practices in a variety of forms always have been part of social and sexual lives in Africa, and thus should be embraced by any notion of 'African sexualities.'

Section II: Postcolonial Critique and Alternative Analytical Approaches

In her introduction to the 2011 volume on 'Africa Sexualities,' Sylvia Tamale picks up from Gayatri Spivak the concept of 'unlearning.' For many of us, she says, "our learning processes grossly neglect to instruct us in the important concept of unlearning. Without this skill, it is extremely difficult for us to think critically and to question unjust frameworks or challenge the established order. … Unlearning literally requires us to discard our old eyes and acquire a new set with which to see the world. It requires us to jettison assumptions and prejudices that are so deep-seated and internalized that they have become normal and appear to be natural" (Tamale, 2011: 3).

Step one in the process of unlearning is to identify those deep-seated assumptions and prejudices that have been part of our beliefs for so long that they seem natural and normal. Section I of this article focused on such identification. Step two is then to look at the world anew, from different vantage points, with different tools of analysis, all of this in order to relearn in ways that are better tuned to the phenomena we wish to understand. "We need to pry our minds open to fresh ideas, absorb new knowledge and apply our intellect, knowledge and experience to develop a critical analysis of the issue at hand. Opening our minds means to accept differences, to see the world through the eyes of others, to open our ears to diverse viewpoints and to venture beyond our familiar horizons" (Tamale, 2011: 4).

Sex as Distinct from Morality

When studying sexualities, one important aspect of unlearning is to make a distinction between sex and morality. In a Western context, for millennia under heavy influence from Christian conceptualizations, sex, morality, and marriage have been closely interlinked. Moral sex takes place in marriage, or at least in a stable heterosexual relationship; sexual relations of other kinds are in the danger zone of being deemed immoral, even more so if one of the sexual partners is in a stable, marriage-like relationship with somebody else. Morality and sex are so closely connected that it takes effort to think of sex in different ways – without going to the opposite extreme, as was seen in the analysis of the Caldwell et al.'s paper above, of only seeing 'promiscuity' and unrestricted sex.

Certainly African societies often impose restrictions on sexuality, but in different ways. It also depends on which kinds of sex we are talking about. Heterosexuality takes place in different contexts and settings. According to fieldwork in rural Mozambique, in some respects sexuality may be rather free,

particularly where there is no risk of pregnancy (prepuberty and/or non-penetrative sex); postpuberty, however, due to the risk of pregnancy, sexuality is more restricted. Ideally initiation rituals take place at the time of the first menstruation, and ideally a young woman would go from initiation rituals directly into marriage. In some places in Africa initiation rituals and marriage were conflated, such as in Namibia as described by Heike Becker (Becker, 2004). Marriage thus may be understood as an institution for control of fertility, more than control of sexuality per se. "What mattered in kinship contexts was control of sex for procreation. Sex in itself was much less severely controlled, as long as it did not result in pregnancies. Historical sources from Kwa-Zulu Natal describe how *usukoma* – non-penetrative thigh-sex – made it possible for young men and women to engage in sex before marriage without fearing for the consequences in terms of pregnancies. … In matrilineal northern Mozambique pre-puberty/pre-marriage sexual relations were distinctly encouraged in order that the women should be properly educated for adulthood. The marker of adulthood was the initiation ritual, immediately after which young women were expected to marry" (Arnfred, 2004: 16).

The general point to be made is that control of sexuality is/was guided by pragmatic concerns (procreative sex may result in children, and children must know where they belong) more than by morality. At the same time there are also norms, which ascribe a child born by a married woman to her husband's lineage, even if it is more or less known that the biological father of this particular child is somebody else. Nzegwu points to patterns of what she calls 'transmarital sex' of Igbo wives (Nigeria) confirming that according to Igbo norms "the question of which pater constituted the line of descent was irrelevant, because the collective view was that a husband of a bride is the father of the wife's children, regardless of how they were begotten" (Nzegwu, 2004: 7). In matrilineal contexts, the sexual autonomy of wives is/has been even greater, the children anyhow belonging to their mother's lineage. Matriliny accordingly makes for temporal marriages: if there is no more sexual attraction, the man might as well move on. In matrilineal contexts, marriage is a matter of getting new blood and new children into the matrilineage, it is not a question of founding new families. According to Karla Poewe, based on her research among matrilineal Luapulans in Zambia, "a man's marital role is to sexually satisfy and impregnate the woman and to provide for her during her pregnancy. The man should not in any way be an object of exclusive emotional investment, nor the focus of attention" (Poewe, 1981: 67). "Ties of intimate dependency between spouses are discouraged in many more or less subtle ways. While sexual enjoyment is valued, it is not limited to one specific partner" (Poewe, 1981: 56).

Women as Active Sexual Beings

In Poewe's research women in matrilineal Zambia come forward as active sexual beings. It is the duty of young women through the sexual powers to "engulf male strangers and convert them into kin" (Poewe, 1981: 68). In matrilineal northern Mozambique, Christian Geffray applies a similar analysis to his findings: men are progenitors, women are seducers. Young women are expected to be proficient in erotic arts (they are checked in this discipline during the initiation rituals) and in return for their role as progenitors the young men "at least have the right of expecting their wives to seduce them and to give them sexual pleasure" (Geffray, 1990: 129).

Research on female rituals of initiation in northern Mozambique reveals how sexual proficiency is considered a pride and a privilege by women (Arnfred, 2011). Young women are instructed in the art of lovemaking during the initiation rituals, but like other areas of women's arts, the learning process starts well before puberty. In parts of northern Mozambique, in bygone days, prepuberty sexual relations between girls and boys were accepted and it was even believed that intercourse and caressing was important for making the girl's breasts grow and for menstruation to emerge. Also well before puberty the girls would be instructed regarding how to pull the small labia of the vagina in order to make them longer. This pulling of labia (*ithuna*) was – and still is – considered an important aspect of a young girls' preparation for lovemaking, and for giving and receiving sexual pleasure. Similar findings are reported by Sylvia Tamale from her investigations in Kampala; she found the practice of labia-elongation anything but dead in the capital of Uganda. Tamale's findings also show the practice of elongation to be perceived as enhancing the erotic experience of the man as well as the woman: "This practice, encoded within the *Ssenga* institution, has enhanced sexual pleasure for women and expanded their perceptions of themselves as active sexual beings," Tamale asserts (2005b: 12). *Ssenga* is originally the name for 'paternal aunt,' having turned into an institution. 'The phenomenon of *Ssenga*,' Tamale says, "represents one of the most powerful cultural inscribers on women's bodies among the Baganda" (Tamale, 2005b: 12). *Ssenga's* are tasked with the sexual and cultural education of their nieces (and other young girls); in Tamale's description of *Ssenga's* tutorials you find a whole array of erotic gadgets and capacities: "Needless to say, sexuality featured prominently in *Ssenga's* tutorials, which would focus on erotic skills, sexual paraphernalia and aphrodisiacs in the form of herbal perfumes, sensual oils, sexual beads (*obutiti*) and so on" (Tamale, 2005b: 17).

The image of women as active sexual beings is confirmed by research from other parts of Africa too. In Senegal the women of a particular ethnic group, the Lawbe, are particularly known as specialized in erotic paraphernalia and knowledge, among which scents and perfumes have a special standing. According to Abdoulaye Ly "the eroticism of the Lawbe is most vividly expressed by the consummate art of their women to concoct a variety of scents ranging from the incense to the pearl belts soaked in a cocktail of diverse perfumes" (Ly, 1999: 47). Tshikala Biaya talks of "a double girdle of shimmering, multicolored pearls, *bine bine*, which evoke local forms of erotic play (…) This is the same type of pearls that is worn hidden under the *drianké's* loose-fitting *boubou*, from where it emanates intoxicating perfumes" (Biaya and Rendall, 2000: 716). The Senegalese figure of the *drianké*, according to Biaya, is "a titillating, plump and mature woman expert at *thiuraye*" (Biaya and Rendall, 2000: 715). *Thiuraye* is a term for a series of erotic practices, including "scented undergarments and girdles of fragrant pearls"

(Biaya and Rendall, 2000: 715). Francis Nyamnjoh describes *driankés* as "reputedly good at business, well-to-do and generally in a position to flatter younger men with gifts and money. They are also experts at the art of seduction, with an impressive mastery of the traditional kit for seduction and eroticism in Senegal" (Nyamnjoh, 2005: 300). The *diskette*, on the other hand, is more 'Barbie-like' (Nyamnjoh, 2005: 301). Biaya describes the *diskette* as "a young Senegalese woman with the slender body of a fashion model, who frequents the nightlife of urban discotheques and bars. Less expert than the mature, full-figured *drianké*, the *diskette* nonetheless carries a double erotic charge: a body type with global erotic purchase, stamped with the *thiuraye* seal of erotic sophistication and craft" (Biaya and Rendall, 2000: 715).

Sex an Asset, Not a Liability – From Women's Points of View

Generally in Western contexts, women's sexuality is perceived as a source of vulnerability and victimization. Initial studies of sexuality in Africa proceeded along similar lines, but post-colonial feminist scholars suggest different approaches. Research in northern Mozambique likewise confirms that sexuality is often seen as a strength and an asset for women, a source of identity and power; sex is a highly valued female capacity. Women, particularly older women, are masters of sexuality. Rituals of female initiation are occasions for the older women to pass on these capacities to younger generations. Very unlike Western contexts where sexual encounters often take place on the terms of men, fieldwork findings from northern Mozambique indicate that here men are expecting women to take the lead (Arnfred, 2011).

Nkiru Nzegwu frames the difference in this respect between Africa and the West as a matter of two different logics: "[The] sexualized gender hierarchy of the West eroticizes male dominance and female subjugation as sexual," she says, "making eroticism and sexuality a basis for women's moral anguish, conflict and downfall" (Nzegwu, 2011: 255). In African cultures, in contrast, "sexual pleasure and fulfillment were equally expected for both women and men, and sensuality was neither pornographic nor the basis of women's subjugation and domination, as was the case in Europe" (Nzegwu, 2011: 254). 'African sexual ontology' Nzegwu asserts, "is not Western sexual ontology in a black face; … it has its own defined history; … it is in fact quite progressive and a resilient stronghold of female power" (Nzegwu, 2011: 254).

Also Bibi Bakare-Yusuf sees sexuality as a potential stronghold of female power, in Africa and elsewhere. A potential which has, in her reading, been undermined by Christianity. In the Bible Eve represents female desire, however with the well known consequence of being expelled from the Garden of Eden. There is a tension at the heart of Christianity, Bakare-Yusuf says, in as far as "desire manifests itself at the outset and is immediately cast out. At the moment of desire's coming to presence, it leads to expulsion. Fertility must be excised from any relation to an originary female desire or action" (Bakare-Yusuf, 2013: 34). There is a point to keeping female desire subdued and invisible; the point is patriarchal power. "Positioning women as weak or damaged subjects gives renewed legitimacy to patriarchally motivated discourses of control and protection" (Bakare-Yusuf, 2013: 30). This is what took place under colonialism, with the construction of women as victims to be rescued by valiant colonial officers. "White men saving brown women from brown men" as Gayatri Spivak has put it (Spivak, 1988: 296).

Bakare-Yusuf sees the influence of Christianity in the present subordination of women. And furthermore, in her analysis, by quenching female sexual desire, and by defining active female sexuality as immoral, a core of women's potential for resistance has also been taken away. "For societies that have been subsumed under the panoptical gaze of Christian colonialism," she says, "occluding female originary desire … helps to reduce the opportunities for resistance. In other words, if female sexual pleasure and desire is highlighted, the supremacy of male desire, power and control is called into question" (Bakare-Yusuf, 2013: 35). In this optic, maintaining a focus on female sexual pleasure and desire has important political implications in terms of resistance to patriarchal power. The suggested strategy is counter-narratives to the dominant narratives of sexuality as risk-and-danger approach, the "hegemonic discourse of sexual terrorism," as Bakare-Yusuf calls it (Bakare-Yusuf, 2013: 30). Telling stories of female sexual power is what is needed, acknowledging female sexual pleasure and desire.

The Power of Pleasure

For a long time a focus on pleasure was totally absent from any account of sexuality in Africa. Sexuality in Africa was constructed as a troubled area, a problem for everybody: colonialists, African presidents, development agencies, even if they might construe the problem in different ways. Presumably, among African men and women, there has always been a focus on pleasure – this is what sexuality to a large extent is about, in Africa and elsewhere – but this was not highlighted neither in research, nor in politics, or in initiatives of development. This situation is now changing – at least in the context of research. The quoted article by Bakare-Yusuf is published in a 2013 volume titled: 'The Political Power of Pleasure,' with articles from many parts of the previously colonized world (not just Africa). Sylvia Tamale's (2011) volume on 'African Sexualities,' grand in content as well as in size (656 pp.), is another contribution to a different view on sexualities in Africa. And articles are emerging from young scholars: Rachel Spronk (2012, 2014) and Christian Groes-Green (2012, 2013) among them. The focus on pleasure throws new light on heterosexual practices in ways that highlight male as well as female sexual enjoyment.

From her interviews with young urban professionals in Nairobi, Kenya, Spronk reports that men as well as women see fulfilling sexual lives as important aspects of their identities as professionals 'being African the modern way.' Regarding the young women of her material Spronk says: "Enjoying sex is considered to be part of healthy self-awareness and they desire fulfilling relationships in which mutual sexual pleasure is the norm. Sexual pleasure, then, has become a positive self-identifier for being a contemporary independent woman" (Spronk, 2014: 14). And regarding the men Spronk says: "For

the men in my study, besides the need to work and/or study hard and have a career to become socially successful, sex was also constitutive of their sense of manhood. … [They] claimed that they felt obliged to be knowledgeable about women's sexual pleasure … [and] they took pride in having sexual skills which they had learnt from watching porn or having read booklets or internet sources" (Spronk, 2014: 15). For men and women together Spronck concludes that "in their definition of sexuality female sexuality becomes redefined as pleasure and not exclusively as procreation, and male sexuality becomes partly redefined in relation to female pleasure" (Spronk, 2014: 17). These are important findings, signaling remarkable changes – at least in certain layers of society – compared to what was supposed to be the case in previous generations.

Christian Groes-Green reports similar findings from his work among young men and women in Maputo, Mozambique. Groes-Green's young people are less well-off and less established than Spronk's young professionals. The women are typically *curtidoras*, young women, who cultivate relationships with often older, well-off men, *patrocinadores* in Maputo slang, in order to gain a living and/or to pay for their studies; at the same time they also have a boyfriend, a *namorado* or a *bom pico*, with whom they have pleasurable sex. The *bom pico* is a good lover, a young man who sexually is tuned to women's pleasure. 'Sex is all about the woman,' as one young man says. "My pleasure is her pleasure" (Groes-Green, 2012: 100). 'The *bom pico* notion,' Groes-Green sums up, "could be seen as an expression of an emerging male ideal which provides young men with an alternative to more dominant and misogynist versions of manhood" (Groes-Green, 2012: 105). In Groes-Green's analysis, however, the *bom pico* notion is also linked to marginality: young men who in order to compensate for lack of financial resources, cultivate their capacities as good and caring lovers. With the *bom pico* notion and the concept of philogynous masculinties, Groes-Green wants to "open a theoretical landscape that is able to embrace contextual variations of men's and women's own enactments and notions of gender, power and equality, rather than a priori assuming universal gender inequalities across diverse cultural settings" (Groes-Green, 2012: 107).

In another paper Groes-Green elaborates on the concept of female sexual power, showing how young Maputo *curtidoras* manage their sexual relationships with older men through close relations to female kin, from whom they learn the tricks of the trade regarding not only how to seduce men, but also how to keep them enchanted. "The erotic knowledge that female elders transmit to daughters and nieces is transformed into bodily capacities that women use to seduce *patrocinadores*. … Erotic powers are reproduced within a female space where secret knowledge is passed on from older to younger women" (Groes-Green, 2013: 106). In this article, Groes-Green makes the connection between on the one hand 'traditional' sexual capacities of rural women, and on the other hand 'modern' eroticism and female powers of seduction, a connection which is also pointed out by Sylvia Tamale in her writings on the Baganda institution of *Ssenga* (Tamale, 2005b). The *Ssengas* as sexual advisors to young girls seem to be an institutionalized version of the Mozambican female elders.

Conclusion

Ways of understanding sexuality in Africa today have deep colonial roots. Widespread homophobia – 38 out of 54 countries on the continent criminalize homosexuality – links directly back to colonial constructions of Africa as heterosexual. African populations and African presidents, nowadays, identify with this colonial construction – even if contemporary research, e.g., the work of Tamale (2011), Epprecht (2004, 2008, 2013), and many others, points to very different realities.

Researchers and presidents nevertheless agree that "African societies tend to place an extremely high value on heterosexual marriage and reproduction" (Epprecht, 2013: 57). Studying heterosexuality in Africa, it is however important to realize that sexuality and morality are not necessarily interlinked in the same way as in Western societies. In Africa regulations of sexuality seem to be more pragmatic (and less moralistic), marriage controlling fertility more than controlling sexuality per se.

Postcolonial scholarship is presently in the process of reconceptualizing sexualities in Africa. A new focus on pleasure is gaining ground, along with a broader approach to studies of sexuality, until recently dominated by notions of risk and danger. The risk-and-danger approach is particularly frequent in contexts of development interventions, where sexuality is perceived as linked to violence and mutilation, disease and death. This is not to say that risk and danger are not around, they surely are. The point is, rather, conceptualizations should be more inclusive, in order to capture also other aspects of sexuality. Recent research on sexual mores of young urban men and women show interesting results in terms of caring, attentive sexual relationships with focus on mutual pleasure and enjoyment being perceived as part of 'being African the modern way' for men as well as for women.

Heterosexuality in China

Abstract

China came from the fertility cult that took heterosexuality and reproduction as its primary duty. Being a large country consisting of numerous tribes with different sexual practices, within the limits of patriarchy, it has been sexually open and accommodating to variant sexual life styles for most periods of its history. Modernization and an open-door policy since the last century have posed many sexual problems that China has yet to solve, overcome, or adjust to.

The Chinese as a Valuable Resource for Sexuality Studies

Modern sexology originates from the West, but Chinese sexuality, with its long reliable historical record and diversified practices covering up to one-quarter of the world population, has long been a valuable source for international reference. The recent rapid socioeconomic changes in China also have raised many new sexual challenges to the country. It would be of global interest to know what these challenges are and how they are being coped with. This article will summarize the key issues in Chinese sexuality since early times, widening to the more horizontal social perspective coming to the recent period.

The Legendary Heterosexual Gods and Universe

Similar to many ancient cultures, the Chinese primitive culture is best described as a fertility cult that practiced a system of nature worship involving rites and ceremonies believed to ensure productiveness and fertility. According to Chinese legend, man was created by the Goddess Nuwa who also invented the marital system when she took her brother Fu-Xi as husband. The most ancient Chinese philosophy, the Yin-Yang theory holds that the cosmos is composed of the female (Yin) and male (Yang) elements, and their interaction is the cause of all things, matters or nonmatters.

With their Gods and universe all heterosexual, the Chinese has never stopped celebrating sexuality as the Tao (way) of nature, to be followed, imitated, and nourished. The ancient Chinese medical text *Su Nu Jing* (*Book of the Plain Woman*), which written around AD 200–500 or earlier, gave a comprehensive account of the medical observation and study of sexual intercourse and, based on this account, made intelligent recommendations on how healthy and pleasurable sexual intercourse can be achieved and sexual problems or dysfunction remedied. Subsequent important texts on the same topic have continued in Chinese medicine, improving the findings and recommendations, and signifying the importance of this aspect of life in the Chinese mind (Ng and Lau, 1990).

Consolidation of Patriarchal Heterosexuality (AD *c.*1000)

As the largest of the Chinese tribes, the Hans, became increasingly more 'civilized' and patriarchal, heterosexual concepts and practices leaned toward the male side. The patriarchal family and polygyny marital system already had set in when reliable historical records of Chinese history began from around 2000 BC, but the negation of female sexuality at the expense of male superiority and dominance only reached its peak after the Tang dynasty (AD *c.*1000) reflected by the prosperity of bound feet and female prostitution. The national obsession for the fetishistic bound-feet damaged the health of Chinese women from their toddler days for more than a 1000 years. Brothels were not only legal but also taken as elite cultural circles for scholars and the higher social class.

The male-dominated heterosexuality, however, did little to affect other sexual lifestyles in ancient Chinese, as long they were by tradition or voluntary choice. Homosexuality, transgenderism, pedophilia, incest, bestiality, and many other types of sexual interests that modern sexologists name as paraphilia or sexual variations were accepted or tolerated within a wide range. So, too, were the different types of marital systems or practices that we now call marriage by free choice, arranged marriage, polygamy, polyandry, group marriage, temporary marriage, trial marriage, 'running marriage', sex partnership, pre- or extramarital sex, husband–wife swapping, and more. This acceptance owes to the fact that the China is ethnologically a hotchpotch of more than 50 tribes with quite independent cultural, anthropological, and historical origins. Mutual acceptance, tolerance, or respect of different sexual lifestyles was the only way to keep the country united and harmonious (Wu and Ng, 2000).

Sexual Restructuring in the Twentieth Century

The situation underwent a big change by the end of the nineteenth century (Deng and Cheng, 2004). In its first open-door policy started in 1899, China had to take up a lot of the Western culture to survive and maintain its global competitiveness. Western sexual influences also were strengthened by the Western powers, which, in their colonization of Asia, also imposed much of their culture and lifestyle on the people they governed. When Dr Sun Yat Sin, a Christian and Western-trained medical doctor overthrew the last Chinese Empire in 1911, he led Chinese sexuality toward a nearly completely Western system: Monogamy was encouraged, bound feet and prostitution were condemned, gender equality was promoted, and homosexuality and many other types of sexual variations were considered problematic. After the Communist Party took over China in 1949 (as communism is basically an ideology of

Western origin), much of the Western conservative sexual mentality remained and was further strengthened. Monogamy was made the only legitimate form of marriage in China and prostitution was illegal until the early 1960s when the Communist Party embarked on a series of campaigns that purportedly eradicated prostitution and hence venereal diseases in the country (Li, 2010). The result was that by 1964, all venereal disease research institutes were closed, and the treatment for the disease was practically not taught in the medical schools. At the same time, the existence of homosexuals in China was officially denied.

The pressure of overpopulation in China prompted the government to apply the one-child policy in 1978 (Zhang, 2007). This was the first time China ran a policy that was incompatible with what is basically a fertility culture.

Re-Enlightenment in the New Millennium

After the Cultural Revolution (1966–76) and with the implementation of the 'second' open-door policy, sexuality in China gradually began to take a more enlightened and practical turn. In 1982, the *Textbook of Sexual Medicine* written by Robert C. Kolodny, William H Masters, and Virginia E Johnson was translated by urologist Wu Jia-Ping. It revived interests in the promotion of sex education sexual health in the public as well as the academic sector. Prostitution and venereal diseases were recognized as serious problems again. Laws against prostitution were refined and implemented mainly in the form of periodic antiprostitution campaigns by the law enforcers.

The first sex education research association in China was established in Shanghai in 1986. Similar associations in other major cities in China soon followed. In 1988, the Ministry of Education, the Ministry of Health, and the National Population and Family Planning Commission jointly announced the launch of sex education in schools. Sex education has since been included officially in middle school curricula. Despite difficulties and variation in different regions, it can be said that nearly all students in China now take at least one sexual physiology class before they finish the third year of junior middle school.

The China Association of Sexology was established in 1994. It oversees and advises on the nation's sex education and sexology studies and runs annual conferences on sexology topics in different cities of China. It also publishes monthly the *Chinese Journal of Human Sexuality*, which is the most authoritative sexology journal in the country.

Parallel with these positive changes in social policy, sex became more easily expressed, discussed, and taken care of openly in public (Dong and Li, 2010). The number of clinics dedicated to the prevention, treatment, counseling, and rehabilitation of sexually transmitted diseases (including AIDS) and sexual dysfunction increased, applying knowledge and skills from both Western and Chinese traditional medicine in different combinations (Yan, 2008).

Sex Shops and Sex Aid Industries

The first sex (aid) shop, with the Christian name 'Adam and Eve', was opened in 1993 in Beijing and, since then, sex shops have opened in nearly every town and city of China. Contrary to those in many other countries, these shops visible publicly, as independent shops or as part of a pharmacy or a department store, marked with a notice 'For age 18 or above'. The sales attendants, who wear white gowns, could be serving as sex counselors at the same time. Some major cities in China also have sex shopping malls. For example, in Guangzhou, an entire building or a floor can be dedicated to 100 or more sex shops. The items for sale are produced mainly by factories in China, which also produce more than half of the adult products sold globally, accounting for 70% of the world market share. A 2008 report estimated that the sale of adult products in China that year had reached 100 billion Yuan and was anticipated to maintain an annual growth rate of 20% (Chinese American News, 2012).

Sex Law Changes

In 1991, the local police in Anhui consulted the national Ministry of Public Security in the handling of a case of lesbian cohabitation. The Ministry's conclusion was that it was not a case for law enforcement because Chinese law does not expressly provide any rules, and it was not a case of criminal hooliganism. As the first official judicial interpretation of homosexuality, this judgment set a historic landmark, a reference point for future police to deal with similar problems, confirming that China always has had a nondiscriminating attitude toward homosexuality. As for homosexuality being a mental illness, the Chinese Classification and Diagnostic Manual for Mental Disorders (CCMD), modeled from the US Diagnostic and Statistical Manual of Mental Disorders (DSM), originally had included homosexuality as a mental illness. In its third edition published in 2001, however, the condition was removed after public consultation and advice from mental health experts.

The first documented sex change surgery was a male-to-female procedure performed in Beijing Medical University Hospital in 1983. The surgery has since been performed successfully in different places of China. One well-known male-to-female is world-renowned modern dancer Jin Xing who underwent the operation in 1996 and performed for the Prime Minister of Britain Tony Blair during his official visit to China in 1998. In 2000, the Ministry of Public Security for the first time officially evaluated the transgender issue and decided that sex or gender selection was a basic right of citizens. Currently, Jin Xing is living in China, married and the mother of three adopted children. It is estimated that more than 1000 transsexuals have undergone sex-change operations in China.

In 2003, a female teacher in Wuhan complained of having been sexually harassed by her supervisor. The case was brought to court. After a nearly 2-year hearing, the court sentenced the supervisor to make an apology to the teacher and awarded compensation of 2000 Yuan for moral damages. This was the first sexual harassment case judged in the country (Yan, 2008).

In 2006, a representative of the People's Congress of China proposed legalization of prostitution to ensure health checks on prostitutes and to prevent the spread of sexually transmitted diseases and AIDS. The proposal was discussed but not passed (Dougherty, 2006).

Sex Cultural Festivals

Another major sign of advance in sexual openness and enlightenment in China is its innovative Sex Cultural Festival. The festival has been held annually in various cities since the start of the millennium. The precursor to the festival was the Sex Aids Trade Fair, which ran annually in Guangzhou for the sex product industries from various parts of China to showcase their latest products, receive orders, and exchange information on recent market trends and opportunities. As the fair grew larger every year and was partly open to the public, the government collaborated with the fair organizer to make it an annual public sex education event consisting of sex education shows, dramas, forums, exhibitions, and street-side sex counseling stalls and any other activities that could bring public attention to important sexuality issues (Ng, 2006). The event was so successful that many other cities began to follow suit and run their own fairs, including Shanghai, Beijing, Foshan, Shenzhen, Zhengzhou, Hong Kong, Macau, Xian, Nanjing, Hangzhou, and many others. The degree of government participation in these festivals varies, but its involvement suggests that China is probably the only country in the world that the government would directly and openly provide priority funding, manpower, and time to support sex education (Ruan, 2008).

Sexual Permissiveness in Youth

Sexual openness and enlightenment brought improvement to some aspects of sex life in China but also presented new problems. As modernization and the development of the Internet facilitated interpersonal and sexual contact, more and more Chinese, especially the young, have begun to advocate sexual permissiveness and sexual freedom. The 1989 nationwide sexuality survey (Liu et al., 1992) reported an average of only about 0.5% college students above age 21 years and about 0.4% of married people between ages 26 and 45 years had five or more sexual partners. In 2004, however, a condom company published an anonymous Internet survey that suggested that the Chinese had an average number of 19.5 sexual partners, higher than the world average of 10.5 and the averages of the Americans and the French. The reliability of this survey might be questioned, but other surveys between 2000 and 2006 also showed a dramatic increase in the numbers of premarital or extramarital sex partners in the subjects studied. For example, in 2000, 32.9% of the subjects said they had had premarital sex, and 16% of subjects said they had more than two sex partners (Pan et al., 2004). The figures increased to 43.5 and 25%, respectively, in 2006 (Jeffreys, 2006).

In the face of the increase in one-night stands, premarital sex, and extramarital sex, some Chinese university students began to move to the opposite direction. In 2005, seven female students from two colleges in Chengdu of Sichuan signed a pact to remain virgins until they married. The pact was posted online and soon was joined by several hundred female college students across the country (Yan, 2008). On 8 April 2008, it was reported online that Zhejiang University had instituted an optional course that aimed to persuade students to preserve their virginity before marriage (Deng, 2008). This trend, however, did not seem to spread. The official policy has remained largely on promoting safe sex, sex and marital education, and sex counseling for youths and rethinking the legal, ethical, and moral implication of sex.

Low Fertility Rate in an Aging Population

Overpopulation has been a main problem of China since the middle of last century (China National Bureau of Statistics, 2010). Its first population boom after 1949 raised its population to a new height of more than 600 million in 1952. The second boom from 1962 to 1973 brought the figure rapidly up to about half a billion. The one-child policy in 1978 slowed down the population growth somewhat, but the total figure still reached 1.3 billion by 2006, more than doubling in less than three decades. The fertility rate, however, already has reached a low value of 1.5, well below the world recognized replacement value of 2.1. This low value, if held unchecked, would mean a rapidly aging population in 20 years, which is unacceptable to the proper functioning of any society. The country therefore has reached a dilemma point as to whether to continue with the one-child policy at the risk of a further aging population or to encourage reproduction for a younger but a continuously expanding population. The official policy, however, thus far has had no plan to loosen the one-child policy at least in the foreseeable 10 years (Zhang, 2007).

Gender Imbalance and Marriage Squeeze

Gender imbalance and marriage squeeze is another serious social complication caused by the one-child-policy in China that has come to the surface gradually at the beginning of this millennium. Because China has a long history of patriarchal tradition, when families were forced to give birth to one child per couple, they wanted their only child to be a male as far as possible. Many families use various means to achieve this, including preconception gender selection, sex-selective abortion, or female infanticide, which are all illegal.

In the 1960s and 1970s, the gender ratio (number of female to 100 male) at birth was already 106, very close to the upper acceptable limit of 107, which the United Nations recommends. Since the mid-1980s, it has been rapidly increasing, with 114.2 in 1992, 116.3 in 1994, and up to 118 in 1999 (Chan et al., 2002). In 2007, a sample survey of the China National Bureau of Statistics reported that the Chinese national average of gender sex ratio at birth was 119.58 and was 122.85 in the rural areas. Hence, China has now the world's highest sex ratio at birth and for the longest duration.

This long duration of gender birth imbalance is precipitating an unprecedented state of 'marriage squeeze' in China. It is estimated that when the imbalance reaches 2020, there will be 30 million more men than women in the marriageable age between 20 and 45 years old. The marriage squeeze theory states that when a gender-imbalanced generation moves into the marital age, the majority gender (the male in this case) will be forced to solve their mate-pairing problem by slightly

postponing their age of marriage or expanding the age difference with their partners. If the gender imbalance lasts too long, however, the sex and age structure will make these simple solutions impossible, inevitably forcing an increasing proportion of the less competitive males to remain single. When this happens, the effect of the squeeze will impinge onto the fertility rate, the confidence and quality of sex, love, marital and family relationships, child rearing, and finally social stability.

Delayed Marriage and Fertility

Statistics are appearing to suggest that the possible negative effects of the marriage squeeze have arrived. China is beginning to see a low fertility rate of below 1.0 in the cities that can no longer be explained by the one-child policy alone. It was 0.61 in Beijing in 2004; 0.86 on average in the cities in 2005; 0.71 in Shanghai in 2010; and in one district of the Jiamusi City (a city in Heilongjiang at the most north-eastern part of China), in 2010, it was only 0.43, the lowest in the world (China National Bureau of Statistics, 2010).

An increasing number of adults in China have chosen or have been forced to remain single, and even if married, to have no children. A survey (National Population and Family Planning Commission Training and Exchange, 2013) conducted from 2010 to 2013 reported that there are in China 249 million unmarried adults over 18 years of age. The data are not sufficient to show how fast this unmarried population is growing, generally, but statistics from individual cities show that growth has been rapid. For example, the 2010 sixth census (China National Bureau of Statistics, 2010) reported that in Shenyang, the unmarried population was about 200 000, three times that of 10 years before; and in Urumqi, the figure was more than 60 million in 2010, which was more than double of that in 2005.

The marriage drop appeared to happen most prominently in the younger age-group. From 2005 to 2010, in the Chinese couples registered for marriage, the proportion of 20- to 24-year-olds has dropped from 47 to 37%, but that of couples over 40 had grown from 3.9 to 12.2% (China National Bureau of Statistics, 2010). Thus, the marriage age of the Chinese people are being pushed back progressively. It was speculated that the causes for this marriage decline, besides the marriages squeeze, have been the high cost for setting up a family, the difficulty in looking for suitable partners, and the loss of confidence in maintaining long-term sex, love, or marital relationships in a busily modernizing society.

Low Sexual Activity and Satisfaction in Couples

Infrequent sexual activities and low sexual satisfaction also may contribute to the low fertility and poor marital quality. By the end of the last century, it was reported (Liu et al., 1992) that the mean frequency of sexual intercourse of married couples was about five times per month, lower than the international average by about half, and only about 50% of were satisfied with their sex life. By early this century, the most extensive report on the frequency of sexual intercourse and extent of sexual satisfaction has been the yearly Global Sex Index Survey performed and publicized by the condom production company Durex (2005–2010). Its reliability and comparability with other sexuality surveys may be questionable, but it is a convenient source of reference. Its coverage and continuity allow for the detection of time changes in different cultures or regions. In its year 2000 report, the sexual intercourse frequency of Chinese adults was 69 per year, only a little more than once per week, below the global average of 96.

The same survey asked about sexual satisfaction for the first time in 2007 when it reported that only 24% of China's sexually active population was satisfied with their sex life. The percentage rose to 42% in 2009, but was still below the global average of 45%, and worse in the modernized cities such as Hong Kong, which was only 29%.

A sexuality survey done by the Renmin University of China in 2002 also gave similar results (Zhang, 2002). In a random sample of 3824 adult males with regular sex partners in different parts of China, their average frequency of sexual intercourse was about once a week, and only 27.1% of them were very satisfied with their sex life. The subjects took life pressure, such as family chores, as the main reason for their low sexual satisfaction. The other reasons raised included poor sex education; relationship problems, such as indifferent attitude with the partner; and extramarital affairs.

Changing Attitude toward Love and Couple Relationships

To look further into the reasons for the poor sexual activity and satisfaction in couples, a nationwide Internet survey was conducted in 2010 on the love and marriage attitudes of Chinese men and women (National Population and Family Planning Training and Exchange Center, 2013). The survey found that the respondents generally believed that intelligence in love ('love quotient') is very important in the process to successful coupling or marriage and that some love education could help them to improve their initiative, optimism, and effectiveness in solving or adjusting to their love problems, through reflection, learning, and growth. A large majority (92%) of the respondents also held an accepting attitude to arranged dating or intimate marriage–couple matching parties.

Television programs and Internet sites were the first to respond to this public need for rapid and arranged dating and match-making. Since the beginning of this decade, more than 400 television match-making programs have appeared across China for single gentlemen (or ladies). These men and women appear before the camera to state their criteria of an ideal love partner and, on the spot, meet a dozen or more ladies (or gentlemen) to make a mutual match and begin dating. These long-series programs have high ratings and serve different age-groups and social classes. On the Internet, match-making companies have good business. Some of them hold yearly large-size on-the-spot meeting and information exchange gatherings in public parks. Each gathering could last for a few days with up to 10 000 participants (Gong, 2013).

The Future of Chinese Sexuality

Chinese sexuality has come a long way from her mainly fertility-based culture, with some periods of regression and conservatism. Coming to this millennium, new and serious problems have arisen because of China's attempt to control population growth and its process to modernize. Many other industrial countries have similar problems, too, but the Chinese, with their pluralistic culture and long history of practical and open-minded philosophy on sex, love, and marriage, seem to be taking innovative steps to overcome or adjust to those problems, attracting a lot of international attention. Much of this attention might have started from a universal concern regarding China's sexual rights, such as poor sexual information provision and censorship, lack of freedom in sexual choices, limited women's rights, child and women trafficking for sexual purposes, sexual violence, and sexually transmitted diseases and AIDS, but this attention gradually has spread to the positive aspects of Chinese sexuality, as reflected in the works of Gulik (1961), Bullough (1976), and many others. Hatfield and Rapson (1993), in a cross-cultural review on passionate love and sexual desire, concluded that the tide of history is in the direction of "an increasing acceptance of passionate love and sexual desire as legitimate, expressible feelings, and a blurring of the differences between the western and eastern sexual cultures".

Ruan (2008), after reviewing the two 'peaks' of sexology development in the last century through the women's liberation movement and the invention of effective contraception, asserted that a third peak will occur this century and be led by China. Undoubtedly, modern sexology started from the West, but there is also an increasingly strong opposition from the Western culture and religion that appears to be getting an upper hand, bringing Western sexological development to a dead-end. Experiences in the last century show that preconditions for successful sexual 'revolutions' include social change and an economic–technological boom, and it is well expected that Asia, especially China and India, will replace the West as they lead the next boom of the twenty-first century (Sheth, 2008). Because sexual revolutions arose along with the social economic booms of the West in the last century, similar revolutions are likely to occur in Asia in this century. With lessons learned from the West, however, combined with the characteristics of Eastern cultural heritage, these revolutions hopefully could be more peaceful, in the mode of 'reforms', in a faster pace, more close to sexological ideals, and with fewer obstacles. Moreover, except for the few regions that had been colonized by the West, Western Christian influences are low in China, especially for fundamentalism. Without these obstacles, and along with social economic changes and a fading of colonial remnants, the original naturalistic Chinese sexual philosophy could return more easily. China has the most numerous and diversified tribes and ethnic groups of the world, practicing very different sexual lifestyles concurrently and harmoniously for thousands of years. Thus, achieving some sexual rights that the West has had the greatest difficulties to attain – such as aspects of sexual freedom, autonomy, and sexual pleasure – would be merely a homecoming for China to its fertility-based culture.

Heuristics in Social Cognition

Abstract

Heuristics are strategies of simplifying judgments that allow individuals to make decisions under suboptimal circumstances. The research on heuristics had a profound and lasting impact on modern psychology, particularly on social psychology. Three classical examples are outlined in detail, the availability, the representativeness, and the anchoring heuristic. Also, heuristic judgments using feelings as information as well as processing fluency are discussed.

Heuristics afford decisions under suboptimal conditions. In this article, the psychological mechanisms underlying such heuristics will be identified. After exploring their role in simplifying judgments under uncertainty, special emphasis is given to the availability, the representativeness, and the anchoring heuristic and to their importance in different social contexts. In addition, other judgmental strategies that serve the same purpose are discussed.

'Heuristics' are strategies of simplifying judgments that allow individuals to make decisions under suboptimal circumstances. The discovery of heuristics has had a profound impact on social psychology (*see* Social Psychology), especially in the field of 'social cognition,' which studies the attempts by individuals to make sense of others. This article describes the general idea of heuristic information processing, looks at specific heuristics, and examines the importance of heuristics for social psychology.

Judgments under Suboptimal Conditions

Whereas traditional theories of human decision making (*see* Decision Making, Psychology of) have focused on the normative aspects of valid judgments while neglecting the context in which they occur, the 'heuristics' approach has directed its attention to the psychological processes that enable individuals to make judgments and decisions under situational, motivational, and cognitive conditions that are less than optimal, such as under distraction or time pressure. Because decisions typically are made in a state of uncertainty, it has proven fruitful to identify the strategies that individuals actually use to arrive at solutions that do not represent the best possible outcome but simply meet specific criteria. The study of these simplifying rules of thumb, called 'judgmental heuristics,' has been spearheaded chiefly by Tversky and Kahneman (1974). Because the concept of heuristics is associated closely with these authors, the application of this term is often limited to the specific mechanisms they have identified. However, the underlying logic of *heuristic processing* also applies to other strategies that serve the same purpose, that of simplifying human judgments and making them feasible under suboptimal conditions (Kahneman, 2003).

Because generally it is not possible to identify the use of a heuristic procedure from the outcome of a judgment, researchers have had to create specific conditions under which heuristics lead to errors. As a result, heuristics have often been associated with the supposed irrationality of human reasoning (e.g., Nisbett and Ross, 1980). However, just as visual illusions do not testify to the deficiency of human perception, the errors produced by judgmental heuristics are not proof of the inadequacy of human judgment in general; instead, they point to mechanisms that allow individuals to make acceptable decisions under natural constraints. These mechanisms, however, have no common psychological characteristics that would make them distinct from systematic processing as their status of a heuristic depends solely on the existence of a more systematic way of processing. That means, heuristic processing could be characterized as 'systematic' if there was a way of further simplifying the heuristic procedure. Still, heuristics are important in shedding light on new ways of simplifying judgments and thereby revealing psychological procedures that have been unknown.

The discussion that follows will introduce the three most prominent heuristics.

The Availability Heuristic

In assessing the frequency or probability of an event (or the co-occurrence of several events), individuals often employ a strategy that is based on the ease with which bits of information can be retrieved or generated from memory. Employers wishing to gauge the rate of unemployment in their community may go to the trouble of obtaining the relevant information from official sources. But if they are not motivated or able to do that, they can try to think of unemployed friends or acquaintances. The more easily they are able to do so, the higher will be their estimate of the rate of unemployment. Tversky and Kahneman (1973) called this judgment strategy the 'availability heuristic.'

A variety of judgments in the social domain have been demonstrated to be based on availability, such as self-perception (Schwarz et al., 1991). One well-researched example is judgments of risks, the assessment of which depends on the frequency with which a type of event occurs. For instance, riding a motor bicycle is risky to the extent that accidents occur frequently. However, the actual frequency of an event and the ease with which it comes to mind may be biased

by several factors, such as the frequency with which events are reported in the media. For example, Lichtenstein et al. (1978) found that causes of death frequently reported in the press were greatly overestimated in terms of their frequency.

Importantly, 'availability' has two psychological components that usually are confounded: the content that comes to mind and the ease (or effort) experienced while retrieving the information from memory (Schwarz et al., 1991). Several studies have shown that these two components can be dissociated. In their classic demonstration, Schwarz et al. (1991) asked participants to recall either 6 (which feels easy) or 12 (which feels hard) biographical examples in which they had shown assertive behaviors. Then, participants were asked to rate their own assertiveness. If participants would base their judgment on the retrieved content as informational evidence, they would rate themselves as more assertive in the 12 than in the 6 examples conditions. ('There are a lot of examples of assertive behaviors in my life, so I must be an assertive person.') In contrast, if they would base their judgment on the experienced ease with which they had retrieved memory evidence, they would rate themselves as more assertive in the 6 than in the 12 examples conditions. ('It was easy to recall assertive episodes from my life, so I must be an assertive person.') The result was that participants based their judgments on the experienced ease of information retrieval, not on the number of retrieved examples.

Beyond this basic finding, which maps the default use of the availability heuristic, several further studies have identified factors that moderate which of the two components, experience or content of retrieval, is used, with subjective ease more likely used under suboptimal judgmental conditions such as low motivation or low cognitive capacity (Schwarz, 1998). For instance, individuals use subjective ease more likely when judging out-group members (Rothman and Hardin, 1997), or under positive mood (Ruder and Bless, 2003). Thus, the availability heuristic, such as many other heuristics (see below, for Section Processing Fluency), is no fixed link, but rather a flexible judgmental tool.

Apart from these examples of judgments and affective reactions on the basis of the perceived ease of cognitive operations, the 'availability principle' in its general form, that is, the finding that increased accessibility of any cognitive representation influences judgment and cognitive performance, has stimulated a host of research in social psychology, such as categorization of persons, causal attribution, or the constancy of opinions after they have been discredited. Finally, the more general notion *processing fluency* (e.g., Reber et al., 2004) can be derived from the availability principle and has become a powerful conceptual tool to explain the causal undercurrents of a variety of judgments under uncertainty (see below).

The Representativeness Heuristic

The representativeness heuristic refers to people's tendency to simplify categorical judgments by relying solely or excessively on similarity. For example, a person who wants to determine the profession of another person may use the target person's similarity to the typical member of this profession. Consequently, a student might decide that a fellow student at the next table in a university cafeteria is a business administration major he or she displays the characteristics of a typical MBA student, such as reading the business section of the paper and talking about the stock exchange. Although this strategy has a logical basis, it tends to neglect other types of relevant information, such as base rates. For example, this university may have many more students of law than of business administration. Information about such a frequency distribution should affect the judgment in the same way as information about the target person. However, research by Tversky and Kahneman (1982) has demonstrated that such base rates largely are neglected even if the individuating information is not very diagnostic.

This neglect of base rates is strikingly similar to findings from attribution research. A number of studies discovered that when people identify the causes of an observed behavior, they attribute it to characteristics of the person and neglect situational influences. This response tendency implies that judges underestimate 'consensus information' (Kelley, 1967) that reflects the power of situations. 'Consensus information' describes how other people behave under the same circumstances and serves as a basic determinant of causal attributions. Specifically, if everybody shows the same behavior in a given context, there is little reason to attribute an action to the unique characteristics of the actor. The tendency to neglect such base rate information in social judgments and to give it less weight than it should have under normative considerations can be understood as a manifestation of the representativeness heuristic because it consists of drawing inferences on the basis of similarity ('a person who behaves aggressively is aggressive') at the expense of base rate information (*see* Person Perception, Accuracy of).

The relationship between this attributional bias and heuristic processing was demonstrated subsequently by varying the conduciveness of the judgmental situation (for a review, see Gilbert and Malone, 1995). Researchers demonstrated that the neglect of situational influences depended on judges' cognitive resources, such that this bias was more likely to occur when people were distracted.

The use of the representativeness heuristic may also result in violations of logical principles. In one study by Tversky and Kahneman (1983), judges had to assess the probability of the joint occurrence of two characteristics of a target (a liberated woman). One feature was highly representative ('She is a feminist'), while the other was not ('She is a bank teller'). In line with the representativeness heuristic, judges considered it less likely that the target person was a bank teller than that she was a feminist bank teller, which is, of course, logically impossible.

Other effects of the representativeness heuristic concern the misperception of chance and the neglect of sample size (Tversky and Kahneman, 1974).

Anchoring and Adjustment

'Anchoring and adjustment' describes the phenomenon that judgments are assimilated toward a value that was initially considered. For example, a person who has to estimate the

proportion of African nations in the United Nations may arrive at a higher percentage if he or she has been exposed previously to a high rather than a low standard of comparison. While such an influence would be hardly surprising if this 'anchor' is offered as a piece of information that is relevant to the judgment in question, Tversky and Kahneman (1974) were able to show that the resulting assimilation effect occurred even if relevance was ruled out by presenting the anchor as the outcome of a probabilistic process.

The psychological process that was suggested by Tversky and Kahneman (1974) for this phenomenon is an insufficient adjustment of the final judgment. Alternatively, Strack and Mussweiler (1997) have proposed a mechanism that is related to the availability heuristic, the so-called selective accessibility model. Here, the anchoring effect involves two stages. In the first stage, judges engage in biased hypothesis testing when they consider the anchor as a possible value of the target. In this process, semantic information consistent with the anchor is activated. As a consequence of this selective activation, consistent information will be more accessible in a second stage when information for the final judgment will be retrieved. In this perspective, the anchoring effect is not the result of a numeric influence or a mere effect of insufficient adjustment but caused by a mechanism of semantic priming that has been demonstrated in many studies in social cognition (e.g., Higgins et al., 1977).

Perhaps the most relevant social domain is that of social comparisons (Mussweiler, 2003; *see* Psychology of Social Comparison). Here, work on the anchoring heuristic suggests a mechanism that explains why and under what conditions comparing ourselves to another person will make us appear similar to that person (Mussweiler and Strack, 2000).

Other Heuristics in Social Psychology: Feelings and Fluency

In the previous sections, three basic judgmental strategies were introduced that were identified by Kahneman and Tversky as devices employed to form sufficiently accurate judgments under adverse conditions and with little cognitive effort, although under certain circumstances, these strategies can lead to systematic distortions. The idea of heuristic information processing has been expanded subsequently to other heuristic cues, with lasting influence on theory formation in broad areas of social psychology.

Feelings as Information

A prominent example is the use of *feelings as information* (for a recent review, see Greifeneder et al., 2011). Specifically, it has been argued that under suboptimal circumstances, individuals use their subjective experiences to judge some other criterion or dimension. The most prominent example surely is the classical study by Schwarz and Clore (1983) who showed that judgments of overall life satisfaction are based on current transient feelings, such as good or bad moods due to sunny or rainy weather – which are irrelevant for general life satisfaction from a normative perspective. The impact of feelings on judgments has been demonstrated for both affective (e.g., Schwarz and Clore, 1983; *see* Emotions, Psychological Structure of) and nonaffective feelings (e.g., Strack and Neumann, 2000). For instance, Strack and Neumann (2000) found that furrowing the brow, which evokes the feeling of mental effort, decreases the likelihood that individuals judge some target person as being familiar. Here, the nonaffective feeling of mental effort was used as a heuristic to guide familiarity judgments (cf, Topolinski and Reber, 2010).

Moreover, a next phase of psychological research does not only show that judgments can be based on (irrelevant) feelings in general but also identifies the boundary conditions and moderators of the use of feelings of information (as already addressed in Schwarz and Clore, 1983). Specifically, calling the informational value of current affect into question using a reattribution paradigm – for instance, by telling participants that their current feelings are caused by an external source – substantially reduces or even neutralizes the judgmental impact of feelings because they are reattributed to that external transient source and thus discounted from the judgment at hand (e.g., Schwarz and Clore, 1983; Schwarz et al., 1991). This not only applies to judgments for which the affective cue is irrelevant and thus only a judgmental bias, such as in the studies on mood and life satisfaction (Schwarz and Clore, 1983), but also for judgments for which current affect is a reliable cue to the judgmental criterion. For instance, while current affect – the gut feeling – is indeed a reliable predictor in intuitions on coherence and hidden structure, reattribution procedures decrease intuitive accuracy and thus sabotage intuition (Topolinski and Strack, 2009).

Finally, beyond this instructed invalidation, other psychological moderators of the use of feelings as information exist. As reviewed by Greifeneder et al. (2011), feelings are more likely to be used as judgmental cues when they are salient, representative, and relevant for the judgmental criterion; when the judgment itself is susceptible for affective information; and when level of processing is low (e.g., under low motivation).

Processing Fluency

A common underlying mechanism of many heuristic judgments is processing fluency being the ease and efficiency of information processing (Reber et al., 2004). Specifically, fluency can pertain to any mental operation, such as perceptual, semantic, or motor processing (Reber et al., 2004). As already discussed, the availability heuristic is based on the fluency of memory retrieval. Relatively high fluency triggers a positive experience (e.g., Topolinski et al., 2009), which has been shown to be used as an experiential cue in many heuristic judgments. For instance, fluency drives spontaneous preference (Reber and Schwarz, 1999), the feeling of truth (Unkelbach, 2007), or intuitions in general (Topolinski and Strack, 2009).

Interestingly, several works have shown that the judgmental use of fluency is flexible in the way that fluency-triggered experiences can be relabeled, reattributed, and discounted. For instance, Unkelbach (2007) has shown that although high fluency is generally used as a cue signaling the truth of a statement, only a brief period of relearning this fluency–truth link prompts individuals to use high fluency as a cue to

incorrectness. Also, when the informational value of fluency as a judgmental cue is discredited – such as in the reattribution paradigms already mentioned – individuals can again flexibly discount their fluency experiences from their judgments (Schwarz et al., 1991; Topolinski and Strack, 2009).

Finally, the idea of heuristics has become effective in a second line of research in social psychology. The study of persuasive communication, in particular, has profited from the distinction between heuristic and systematic processing (Chaiken and Trope, 1999). In this domain, the reliance on peripheral cues (such as the expertise of the communicator or the length of the message) instead of on central features (i.e., the strength of the arguments) was shown to occur under suboptimal conditions. Furthermore, the distinction between heuristic and systematic processing has eventually stimulated the development of dual-process models of the human mind (e.g., Strack and Deutsch, 2004), which map the twofold underlying representational modes of human judgment and behavior.

Conclusion and Future Directions

Over the years, the concept of heuristics has generated many insights into the cognitive dynamics of social behavior. At the same time, however, the idea of heuristic processing has gone far beyond the three mechanisms described by Kahneman and Tversky. In a more general perspective, a universal psychological principle has emerged that sheds light on the flexibility of human information processing under divergent epistemic goals (e.g., Kahneman, 2003). However, the work of finding the laws of this flexibility and integrating it into psychological theorizing, as well as isolating the undercurrent causal mechanisms of heuristic judgments, is still an ongoing challenge.

Abstract

The study of heuristics is an interdisciplinary and time-honored enterprise, with heuristics being examined across a wide range of fields, some focusing on professionals' decision-making. In psychology, two influential research traditions have investigated which cognitive heuristics people use across various tasks. One tradition, which originated in the 1970s, has focused on the circumstances under which heuristics cause deviations from classical norms of rationality. The other, starting in the 1990s, has emphasized that heuristics are neither good nor bad per se, but that their success depends on how they are matched to environmental structures. This view suggests that heuristics, rather than leading to irrationality, enable ecological rationality.

What Is a Heuristic?

A heuristic is a simple but useful method for problem solving, decision-making, and discovery. The origin of the term goes back to the Ancient Greek verb *heuriskein*, which means 'to find out' or 'to discover.' Heuristics are sometimes also referred to as 'mental shortcuts' or 'rules of thumb.' One of their key functions is to reduce the complexity of a problem by ignoring part of the available information or searching only a subset of all possible solutions. Traditionally, heuristics have been regarded as necessary and efficient tools, but ones that produce only second-best solutions. However, more recent psychological research has shown that – under conditions that are ubiquitous in the real world, namely, limited knowledge and uncertainty – heuristics can in fact outperform more complex strategies.

Heuristic methods have been considered in various scientific disciplines (though what exactly is meant by a heuristic varies across fields). Two key treatments of heuristic methods can be distinguished. In philosophy, mathematics, operations research, and artificial intelligence (AI), heuristics have primarily been investigated as prescriptive procedures specifying how a reasonable solution can be found given constraints such as computational intractability and limited time. In biology and psychology, by contrast, heuristic principles have also been used as descriptive models, that is, as models that describe how people and other animals sample information from the external and internal (memory) world, and how they make decisions based on that information. The next section gives a historical overview of the discussion of heuristics within these two contexts.

A Short History of Heuristics

Heuristics as Prescriptive Procedures

Heuristic methods were first developed in philosophy and mathematics as a solution to the problems of algorithmic approaches to complex problems. To illustrate the algorithmic tradition, let us take the mechanical device developed by the Catalan philosopher Raimundus Lullus (1232–1315) in the thirteenth century. The device was able to automatically generate all combinations of religious and philosophical attributes that could be used in a debate (Figure 1). It consisted of six concentric discs representing the basic classes of arguments; each of these classes in turn had nine further attributes. Rotating the discs against each other produced every possible combination of attributes, thus automatically generating different arguments and potentially producing new ones. The German philosopher Gottfried Wilhelm Leibniz (1646–1716) had a similar, though even grander goal in the seventeenth century, namely to develop an algorithm for solving any conceivable problem, using a universal language that would allow every possible problem to be represented. It became increasingly clear, however, that such algorithmic approaches could easily lead to combinatorial explosion. Subsequent scholars therefore explored heuristics as means to bring

Figure 1 A sketch of one of the discs of Lullus' system for deriving all combinations of arguments. Source: http://www.medienkunstnetz.de/works/ars-magna/.

problem solvers to a solution without the need to explore the space of possibilities exhaustively.

René Descartes (1596–1650), the French polymath of the seventeenth century, had formulated simple rules that were supposed to guide the problem solver toward the relevant aspects, rather than to all parts of a problem. In the nineteenth century, the mathematician and philosopher Bernard Bolzano (1781–1848), who proposed various heuristics for problem solving in his renowned *Theory of Science* (*Wissenschaftslehre*), further developed this approach for epistemic agents (e.g., the method of attempting to find truths by means of something that is not yet known to be true, as opposed to deducing truth from known truths). These scholars' heuristics consisted of rather general procedures that were described in relatively vague terms. Their main goals were to offer a road to knowledge beyond proper deduction, to avoid an arbitrary solution process, and to foster creative thinking. For instance, many heuristics aimed at finding useful problem representations by way of analogy or metaphor.

Heuristic methods for problem solving and discovery received wider recognition in modern mathematics through the work of the mathematician George Pólya (1887–1985). Pólya's (1945) procedures consisted of simple rules, such as dividing the process toward a solution into simple steps by, for instance, finding an analogy to a problem, finding a more specialized problem, or decomposing and recombining the problem. Procedures inspired by Pólya later also informed the new field of AI. Relatedly, heuristics proved to be of great practical value in operations research, an applied field of mathematics. Here, they have been implemented as computer-based tools for planning and aiding decision-making in industry.

Methods for simplifying decision-making have also been discussed in economics. Many decisions are made under uncertainty, with key aspects of the problem remaining unknown. In the absence of complete knowledge of the option space and the probability distributions, normative principles of rational choice are difficult or even impossible to apply. Heuristics for making decisions under uncertainty have therefore been proposed (Savage, 1954). The maximin rule (Coombs et al., 1970), for example, selects from a set of options the one that would yield the most attractive outcome under the worst-case scenario, ignoring both the outcomes to be expected under better conditions and the (unknown) probability distribution. The satisficing principle is a heuristic for sequential decision-making (Simon, 1956). Instead of aspiring to identify the globally best option, this principle evaluates each option according to whether it meets a certain minimum aspiration level, and the first option encountered that satisfies that requirement is chosen.

Another research field of economics in which simple, heuristic decision strategies have received attention is game theory. One of the most frequently studied strategies is tit-for-tat. This strategy, which can be applied in repeated games (e.g., the iterated prisoner's dilemma), determines whether or not a player cooperates with his/her opponent. At the first encounter with the other player, tit-for-tat cooperates; in subsequent encounters, it simply copies the other's behavior (cooperate vs defect) in the previous encounter. In a classical computer simulation tournament (Axelrod, 1984), tit-for-tat proved to be the most successful – though simplest – of the strategies submitted. As well as informing attempts to improve conflict resolution, the study of simple strategies for cooperation within game theory offers insights into how cooperative societies might have evolved in the first place.

The advent of the computer as a computational tool and metaphor of the mind in the 1950s spawned attempts to simulate intelligent behavior in machines. The goal of the new field of AI has been to develop computer programs that can perform tasks such as playing chess, proving logical theorems, or understanding language – and a common challenge is, again, to find ways of limiting boundless and therefore prohibitively expensive search of the problem space. In contrast to previous treatments of heuristics, which often portrayed them in rather vague terms, heuristic rules in AI research have been formulated precisely, often in terms of computational models. A prominent heuristic method for limiting search is means–ends analysis, which was developed in the context of Alan Newell and Herbert Simon's (1972) General Problem Solver system. To move from a current state in the problem space toward a goal state (representing the solution), means–ends analysis reduces the distance between the two by first addressing the most important dimension on which the two differ, followed by the second most important dimension, and so on.

Heuristics as Descriptive Models of the Mind

On the assumption that heuristics, though not perfect, are often effective tools for dealing with a complex and uncertain world, it seems reasonable to suppose that the mind employs them naturally and spontaneously. Indeed, the psychologist Karl Duncker (1903–40) argued that human problem-solving strategies rest on heuristic principles (Duncker, 1935). Similarly, Gestalt psychologists conceived of perception in terms of heuristics. Max Wertheimer (1880–1943), for instance, identified a set of simple principles that organize sensory input to yield object perception – such as the 'laws' of proximity, closure, and similarity (Wertheimer, 1923/1938). As in other contexts, these principles of perceptual organization represent best guesses that usually can be trusted, although they do not work all of the time. They are useful because they are adapted to certain regularities in the environment; for example, elements belonging to the same object are typically in close vicinity to each other (the law or heuristic of proximity; see **Figure 2**).

Presently, cognitive heuristics are most commonly studied in research on how people make decisions. Inspired by Herbert Simon's (1916–2001) seminal work on 'bounded rationality' – the study of how people reason and make decisions with limited computational and informational resources, and when

Figure 2 The Gestalt 'heuristic' of proximity: objects positioned close together are perceived as belonging together.

the conditions for rationality postulated by the model of neoclassical economics are not met (Simon, 1956, 1989, 1990) – several research programs have set out to identify and test simple decision strategies. Daniel Kahneman (1934 to present) and Amos Tversky (1937–96) showed that people assessing the frequency or probability of an event often use simple mental shortcuts, such as the availability heuristic or the representativeness heuristic, according to which a judgment is based on ease of retrieval (availability) or on the similarity of an event to a given class of events (representativeness) (Kahneman et al., 1982). What these heuristics have in common is that the cognitive system, when required to make a computationally complex judgment (that necessitates application of the laws of logic or probability theory), substitutes a less complex heuristic attribute, such as similarity (Griffin et al., 2002). Empirical support for the use of these heuristics was provided by creating conditions in which the use of heuristics resulted in systematic errors or lapses of reasoning ('fallacies,' 'cognitive illusions'; Griffin et al., 2002), suggesting human irrationality. From the 1970s, heuristics therefore came to be seen in cognitive and social psychology, and subsequently in behavioral economics, as fallible cognitive shortcuts that people – constrained by cognitive limitations – fall back on in situations in which they would be better off using logic and probability theory. The price of relying on these shortcuts is the risk of committing systematic and severe fallacies of reasoning.

The heuristics examined in Kahneman and Tversky's heuristics-and-biases program were typically vaguely defined verbal descriptions of mental processes. In the research program on the 'adaptive decision-maker,' in contrast, Payne et al. (1993) proposed heuristics for multi-attribute preference tasks that were described in terms of process models. Using computer simulations, Payne et al. tested the accuracy of various preference strategies, both simple and complex, under conditions of time pressure or when the inputs to the strategies, the options' attributes, were highly correlated. The results were then compared with people's actual strategy selection under the same conditions. One key insight was that people are adaptive decision-makers, switching between strategies based on a trade-off between a strategy's prospective accuracy and the time and cognitive effort required to implement it.

From the 1990s, a new research program on cognitive heuristics emerged that challenged both the idea that heuristics are error-prone mental tools (Kahneman et al., 1982) and the notion of a general accuracy–effort trade-off (Payne et al., 1993). Gerd Gigerenzer et al.'s (1999, 2011) research program on 'ecological rationality' proposed that simple heuristics represent prescriptive models of the human mind, thereby connecting the science of heuristics in psychology to earlier research (*see* Heuristics as Prescriptive Procedures). This approach also suggested that heuristics take advantage of environmental structures, and thus picked up on ideas first introduced by Gestalt psychologists (see above).

The new approach to heuristics thus emphasizes that the real world imposes circumstances on the cognitive system that render optimization difficult or impossible (e.g., computational intractability; incomplete knowledge of alternatives, consequences, and probabilities; and changing preference structures). People therefore rely on heuristics not primarily because of their cognitive limitations – although it is indisputable that the human cognitive system is subject to constraints – but because of inescapable properties of real-world problems.

How Well Do Heuristics Work?

The new conception of heuristics in terms of ecologically rational strategies (Gigerenzer et al., 2011) has also challenged the deeply entrenched beliefs that heuristics are doomed to produce second-best results and that optimization is always better. It has been shown that, under some circumstances, heuristics perform as well as or even better than complex strategies involving extensive estimations and computations. For instance, consider heuristics for inferring which of two (or more) alternatives (e.g., cities, companies, sports teams) has a higher value on a quantitative criterion (e.g., homelessness rate, revenue, final score) on the basis of known pieces of information (cues). The normative approach involves weighting and combining all the available cues using complex algorithms such as multiple regression, neural networks, Bayesian networks, or classification and regression trees (see Gigerenzer and Brighton, 2009). Although each of these algorithms processes cues in very different ways, they are all based on the shared premise that all available information should be taken into account.

Models of cognitive heuristics dispense with this premise. They can shortcut the demanding chore of processing and integrating all available information in at least three ways. First, rather than assigning an 'optimal' weight to each cue individually, heuristics can simply tally cues for or against each alternative (tallying heuristic), with each cue receiving the same weight (Dawes, 1979). Second, instead of using all available cues, they can consider just a subset of cues and ignore dependencies between cues. Such 'noncompensatory' heuristics use the first cue that permits a decision to be made and ignore all other cues. This class of heuristics assumes some kind of cue ordering and a stopping rule that specifies when search for information is to be terminated. Cue ordering can, for instance, be based on some measure of cue diagnosticity, such as validity (i.e., the probability that the cue correctly predicts the target variable). The take-the-best heuristic assumes that cues are processed in order of validity, and it compares both alternatives on a single cue, one at a time, until a cue is found that distinguishes between the alternatives (Gigerenzer et al., 2011). Third, some heuristics radically winnow down the number of cues inspected to just one. The recognition heuristic, for instance, only ever considers the 'recognition' cue: when one alternative is recognized and the other is not, it selects the recognized one (Goldstein and Gigerenzer, 2002). The fluency heuristic makes an inference based on the 'fluency' cue: when both alternatives are recognized but one is recognized faster, it selects the one that is recognized faster (Hertwig et al., 2008).

How well do heuristics that do not consider all information perform? And when and why can they perform well? Katsikopoulos et al. (2010) examined the accuracy of the take-the-best, tallying, and minimalist heuristics across real-world data sets drawn from domains such as biology, economics, and sociology. For example, one inference problem required

the strategies to predict which of two cities (e.g., Chicago or Los Angeles) has a higher homelessness rate (criterion value) on the basis of cues such as the cities' average temperature. Two more complex strategies were included as benchmarks: first, linear regression, which weights and sums cues and estimates dependencies between cues; second, naive Bayes, which selects the alternative with the higher probability of having the higher criterion value, given the alternatives' entire cue profile. To compare the accuracy of each of these models, the authors split each data set into two parts and estimated the parameters of each model (e.g., cue validity, cue weight) on one part, the 'training set.' These parameter estimates were used, for each model, to make inferences on the other part, the 'test set.' This is called cross validation, a standard procedure for assessing the predictive performance of models of inductive inference. The size of the training set ranged from just 2–10 objects in the population to 50% of the objects.

Figure 3 plots mean predictive accuracy, defined as a strategy's proportion of correct inferences in the test set, as a function of the training set size. Strategies are differentially influenced by the information that small training sets provide. The accuracy of linear regression and naive Bayes is compromised, presumably because very small training sets provide too few data points to reliably estimate the cue weights. The heuristics, in contrast, are capable of managing with very limited information: Tallying outperforms the other strategies when the training set contains only two objects; the take-the-best heuristic is the most accurate model for training sets of between 3 and 10 objects. The results in Figure 3 appear to be the rule rather than the exception. Simple heuristics such as take-the-best have also been shown to perform well in cross validation when compared with such complex and resource-intensive strategies as linear perception and tree-induction algorithms (Gigerenzer and Brighton, 2009).

Figure 3 Mean predictive accuracy (averaged across 19 data sets) of three heuristics (take-the-best (TTB), tallying (TAL), and minimalist (MIN)) and two benchmark models (linear regression (LR) and naive Bayes (NB)) as a function of the size of the training set (2–10 objects and 50% of the objects in the population). For training samples as small as 3–10 alternatives, the take-the-best heuristic is more accurate than are the computationally complex models (or the other heuristics; the minimalist heuristic randomly selects one cue until it finds one that discriminates); here, the strategies' best performing variants are plotted. Adapted from Katsikopoulos, K.V., Schooler, L.J., Hertwig, R., 2010. The robust beauty of ordinary information. Psychological Review 117, 1259–1266.

These results suggest that more information, more computation, and more time need not always result in better performance, and that the accuracy–effort trade-off does not generally hold. A better understanding has recently emerged as to why and when heuristics are more (or less) accurate than strategies that require more information and computation.

Why Heuristics Work

There is more than one reason for the surprising success of heuristics. Two of the most important are their ability to exploit sophisticated evolved capacities, and the bias–variance dilemma.

Evolved Capacities

Heuristics can exploit evolved human capacities. For instance, the recognition heuristic and the fluency heuristic (see above for definitions) take advantage of the evolved capacities for recognition memory and systematic forgetting (i.e., pushing aside information that is unlikely to be needed again; Schooler and Hertwig, 2005). The simple tit-for-tat heuristic for making decisions in social exchange situations – cooperate first and then imitate your counterpart's behavior (Axelrod, 1984) – takes advantage of a suite of evolved capacities, including memory (players must remember the exchanged value and the accrued debt), numerical discrimination (to evaluate whether an exchange was equitable), and temporal discounting (as reciprocity involves paying an immediate cost for future benefits, those future benefits must be time-discounted appropriately; Stevens and Hauser, 2004).

Ecological Rationality

According to Simon's adaptive view of 'bounded rationality,' human rational behavior "is shaped by a scissors whose two blades are the structure of task environments and the computational capabilities of the actor" (Simon, 1990: 7). This view suggests that any cognitive strategy, heuristic in nature or otherwise, is not inherently good or bad, successful or unsuccessful (Gigerenzer et al., 1999). Rather Simon's scissors metaphor raises the following question: In which environment will a given strategy succeed, and when and where will it fail? Investigations that aim to uncover the environmental structures that foster or are detrimental to a specific heuristic's success have been referred to as studying 'ecological rationality' (Todd et al., 2012). Ecological rationality brings a prescriptive dimension to the psychological investigation of heuristics. One key insight stems from the bias–variance dilemma (Gigerenzer and Brighton, 2009).

The bias–variance dilemma is a well-known phenomenon in machine learning (Hastie et al., 2001). The term 'bias' does not refer to the kinds of deviations from classical norms of rationality that have been documented in the heuristics-and-biases research tradition (Kahneman, 2011). Rather, it refers to the theoretical bet that all inductive strategies, including heuristics, make about the structure of the environment. Bias is one of three components of the

prediction error produced by any inductive strategy. The total amount of error is the sum of these three components:

$$\text{error} = (\text{bias})^2 + \text{variance} + \text{noise}$$

The bias and variance components of the total prediction error can be understood by assuming an underlying (true) function that a given induction algorithm aims to learn. The algorithm's window on the true function is a (potentially noisy) data sample generated by this function. Averaged across all possible data samples of a given size (see the size of a training set in Figure 3), the algorithm's bias equals the difference between the true function and the mean function inferred by the algorithm on the basis of various data samples. If the mean function hits the mark perfectly (i.e., the true function), bias will be zero. Variance, in contrast, quantifies the algorithm's responsiveness to the specific contents of the samples. It is the sum-squared difference between the mean function and the individual functions extracted from each of the samples.

Ignoring noise, the total error of any induction algorithm depends on these two components, and on how the algorithm trades them off. Even an unbiased algorithm may suffer from substantial errors to the extent that the individual functions, possibly derived from few observations (see Figure 3), involve a great deal of variance. Therefore, seeking low bias will not always be adaptive for an organism. By means of illustration, Figure 4(a) plots the mean daily temperature for London in the year 2000, as well as two polynomial models aiming to capture the true temperature function underlying the data: a relatively simple degree-3 and a more complex degree-12 polynomial model. Figure 4(b) plots the mean error resulting from inducing the true function based on random samples of 30 daily observations (training set) as a function of the degree of the polynomial model. A simple relationship emerged: The higher the degree of the polynomial model, the better the model 'fits,' that is, the better it describes the mean function from the training set. Here, more is better. In predicting the observations not included in the training set, however, more is not always better. Instead, the relationship between the degree of the polynomial model and the models' predictive accuracy is U-shaped, with high-degree (>9) and low-degree (1) polynomials suffering from large errors (due to variance). The best predicting polynomial model has degree 4.

The bias–variance dilemma is one framework that provides insights into when and why simple heuristics are successful in some environments, but not in others (Todd et al., 2012). The notion of ecological rationality and Simon's scissors metaphor emphasizes the importance of the match between the structures of simple heuristics and the structures of the environment. Heuristics can be surprisingly accurate relative to computationally more complex strategies when their structure matches that of the environment, and the bias component of error is thus successfully kept at bay; the bias component will not, however, be within acceptable limits when heuristics and environment mismatch. The variance component is at least as important for the success of heuristics. Variance is likely to be the leading source of error when the available observations about the environment are sparse. Controlling this source of error is therefore crucial for

Figure 4 (a) London's mean daily temperature in the year 2000, along with a degree-3 polynomial and a degree-12 polynomial. The two polynomial models were fitted using the least squares method. (b) The mean error in fitting samples of 30 observations and the mean prediction error of the same polynomial models, as a function of degree of polynomial. Adapted from Gigerenzer, G., Brighton, H., 2009. Homo heuristicus: why biased minds make better inferences. Top Cognitive Science 1,107–143.

any inductive algorithm. An algorithm with many adjustable parameters – and thus equipped with great flexibility to accommodate myriad true underlying functions and keep the bias component at bay – is likely to incur substantial prediction error when the window on the environment (the data sample) is fogged up. With sparse observations, flexibility via parameters can become a burden and cause 'overfitting' of the function suggested by the small data samples. In contrast, by forgoing high flexibility and not extracting as much information as is possible from a limited sample of data, simple heuristics control the variance component.

These analyses have suggested a new answer to the question of why humans have learned to use simple heuristics that ignore part of the information and forgo complex processing: In

uncertain worlds that often afford organisms only limited and costly chances to make observations, heuristics appear to achieve robust inferences.

Taxonomies of Cognitive Heuristics

There are various ways to map the mind's inventory of heuristics, the building blocks of which they are composed, and the evolved capacities that they co-opt. One taxonomic dimension is the specific task a heuristic is designed to solve. Across different research traditions in psychology, cognitive heuristics have been proposed for tasks as diverse as probability and frequency judgments in situations of uncertainty (Griffin et al., 2002), preferential choices under risk and uncertainty (Payne et al., 1993), inferential choices and estimates (Gigerenzer et al., 1999), sequential search (Gigerenzer et al., 1999), moral judgments and behavior (Hertwig et al., 2013), and resource allocations in social games (Hertwig et al., 2013), as well as for a wide variety of professional tasks, ranging from predicting criminal offenders' whereabouts to customer loyalty (Gigerenzer et al., 2011).

Another way to carve up the mind's inventory of heuristics is in terms of the domains in which they can operate. Hertwig et al. (2013) proposed that two broad domains be distinguished: 'games against nature' and 'social games.' Games against nature refer to situations in which a person needs to predict or outwit nature (e.g., identifying a good enough location to set up camp or predicting tomorrow's weather). The outcome a person experiences in these games is determined jointly by his/her decision and the true state of nature. In social games, in contrast, how well a person performs depends not on a dispassionate other such as nature, but on the decisions of other players who pursue their own interests. Hertwig et al. (2013) distinguished heuristics according to whether they are bound to games against nature (e.g., the ancient rule of thumb, "Red sky at night, sailors' delight; red sky in the morning, sailors' warning"), to social games (e.g., tit-for-tat), or are able to travel across social and nonsocial worlds (e.g., take-the-best and the N^{-1} heuristic).

Still another taxonomic dimension is the route through which a heuristic becomes part of a person's repertoire of cognitive strategies. Heuristics can be learned individually (through trial and error), socially (e.g., from parents and peers), and through evolution (e.g., possibly sequential search heuristics in the context of mate choice; Gigerenzer et al., 1999). They can also be explicitly designed as cognitive tools to help professionals make better decisions in the real world. For instance, fast-and-frugal trees that follow the template of heuristics such as take-the-best (Gigerenzer et al., 1999) can be constructed to foster accurate medical diagnoses (Jenny et al., 2013). Due to their simplicity, such trees can be easily memorized and understood and could be taught in medical schools.

Further Directions

The study of heuristics is an interdisciplinary and time-honored enterprise, with heuristics being examined in a wide range of domains, including applied fields such as operations research and marketing. In psychology, two influential research traditions have investigated the cognitive heuristics that people use to make inferences, choices, and judgments in social and physical environments. One tradition has focused on the circumstances under which heuristics cause people to deviate from classical norms of rationality (Kahneman et al., 1982). Another tradition has emphasized that heuristics are neither good nor bad per se, nor are they always inferior to more complex strategies. Instead, the performance of a heuristic depends on its match with the structure of the environment ('ecological rationality'; Gigerenzer et al., 1999) and the amount of knowledge a decision-maker has about that environment (bias–variance dilemma). Future research should continue to explore the structures of decision environments and choice architectures that foster the usefulness of heuristics. Relatedly, the psychological issue of how decision-makers choose between different heuristics needs to be better understood. Finally, the insights into the interplay between the design of environments and heuristics should be implemented to help professionals in the real world – who often operate under conditions of time pressure and incomplete information – to make better decisions.

Hierarchical Models: Random and Fixed Effects

Dennis V Lindley[†], Minehead, Somerset, UK

This article is reproduced from the previous edition, volume 10, pp. 6685–6690, © 2001, Elsevier Ltd.

Abstract

The article describes probability models that are in the form of a hierarchy; the basic quantities in a situation having their probabilities described in terms of parameters, which themselves are described in terms of other parameters, and so on. This is an arrangement which provides great flexibility in probability modeling. Distinction is made between random effects, to which are attached probabilities, and fixed effects, which have probabilities only in the Bayesian paradigm. Examples of hierarchical models are given, together with illustrations of calculations needed for their resolution. Alternative descriptions in terms of equations are described.

The Basic Statistical Model and Its Probability Interpretation

The model that has dominated statistical practice recently supposes that data x have, for each value ψ of a parameter, a known probability distribution dependent on the unknown ψ. The distribution may be described by the probability density

$$p(x|\psi) \qquad [1]$$

where p is a generic symbol for a density of the quantity, here x, before the bar; the symbol after the bar describing the conditions applying to the distribution, here the supposed value ψ of the parameter. Statistical inference then consists in making some statement about the parameter on the basis of the data; such as a point estimate for ψ, or a test that ψ assumes specified values. An important, special case has x, a vector $(x_1, x_2, \ldots, x_n)$, of n components, and ψ chosen such that, given ψ, the components are independent and identically distributed (i.i.d), when eqn [1] assumes the special form

$$\prod_{i=1}^{i=n} p(x_i|\psi) \qquad [2]$$

The Bayesian approach would include, in addition to the density eqn [1], a probability distribution for ψ expressed through a density $p(\psi)$. Statistical inference then consists of calculating $p(\psi|x)$ by Bayes's theorem, inverting the roles of x and ψ in eqn [1].

A distinction is often made between the nature of the probabilities involved in eqn [1], and more particularly eqn [2], and those in $p(\psi)$. In view of the repetitions under similar circumstances of $x_1, x_2, \ldots, x_n$, their probability is associated with frequency and the x_i thought of as successive realizations of a single random variable. Alternatively, $(x_1, x_2, \ldots, x_n)$ is viewed as a random sample from a population. In contrast, ψ is a fixed, but unknown, quantity and, when introduced, $p(\psi)$ expresses beliefs about the values it might assume, without reference to frequency or populations. The disparity between random, for x, and fixed, for ψ, has played an important role in the development of hierarchical models, leading to different inferences depending on whether the effect is supposed fixed or random. In the Bayesian approach there is no distinction and all probabilities express beliefs; the special case eqn [2] reflecting the belief in exchangeability among the observations x_i.

The Hierarchical Model

To illustrate the need for a hierarchical model, consider data consisting of repeated observations divided into groups. Let x_{ij} denote the jth observation in group i ($i = 1, 2, \ldots, m$; $j = 1, 2, \ldots, n$), with n observations in each of m groups, and suppose that within each group the values are conditionally iid with distributions that may vary from group to group. A popular, special case has

$$x_{ij} \sim N(\theta_i, \sigma^2) \qquad [3]$$

with the x_{ij} being independent given $\psi = (\theta_1, \theta_2, \ldots, \theta_n, \sigma^2)$, so that they are normally distributed with common variance σ^2 but with means that depend on the group. This model is the basis for one-way analysis of variance where inference may well concentrate on whether the means are truly different and, if they are, of what these differences consist. As it stands, this model is just a special case of eqn [1] with x the set of x_{ij} and ψ as above; but now contrast two cases that differ in respect of the nature of the groups. In the first, the study is one investigating the potency of a drug and the groups correspond to dilution levels. In the second, the milk yields of cows are measured and the groups correspond to different sires. In both cases, it may be reasonable to think of the duplicate measurements within a group as i.i.d, forming a random sample from a possible population, in agreement with eqn [3]. But there are differences between the nature of the groups; for in the dilution experiment, the levels are fixed, whereas, with the sires, those selected may be thought of as a sample from a population of sires. In the language of the last paragraph, the θ_i are fixed in the dilution experiment, but random with the cows. In the latter, it might therefore be reasonable to suppose that the means are capable of a frequency description and a probability distribution. A possible, simple case is to suppose that, in addition to eqn [3],

$$\theta_i \sim N(\mu, \tau^2) \qquad [4]$$

[†] Deceased

with the θ_i being independent given μ and τ^2. The frequency interpretation is inappropriate in the dilution experiment, where the levels have been organized, for example at levels 1, 1/2, 1/4 etc. It is also possible that inferences in the two experiments could be directed to different ends. Thus the variability among sires expressed through τ^2 is meaningful, but not in the dilution experiment. There are many other possibilities besides eqn [4] for the second-stage distribution. For example, one group may be a control and the remainder correspond to new treatments. In this case, the distribution for the control mean may differ from that for the others. Outside the Bayesian view, only the latter may have a frequency interpretation. It is this flexibility that helps make hierarchical modeling so attractive.

The probability judgements in eqns [3] and [4] together form a hierarchical model with two stages to the hierarchy, the first expressing the dependence of the data on the group means in eqn [3], the second describing the variability of those means in eqn [4]. The hierarchical model has been thought by some to be appropriate in studies of milk yield, but not in dilution studies, because the means are random in the former but fixed in the latter. The general form of a two-stage, hierarchical model has data x dependent on parameters (θ_1, ϕ_1) expressed through

$$P(x|\theta_1, \phi_1) \qquad [5]$$

at the first stage, with θ_1 having a distribution

$$p(\theta_1|\theta_2, \phi_2) \qquad [6]$$

at the second stage. The parameters of the second stage, θ_2, ϕ_2 are often called hyperparameters. Notice that in this formulation some of the parameters at the first stage are fixed, ϕ_1, whilst others, θ_1, are random and have their probability structure expressed in the second stage in terms of the fixed hyperparameters. In the normal example, eqns [3] and [4], θ_1 here corresponds to the group means there, and ϕ_1 to the common variance. The hyperparameters are $\theta_2 = \mu$, $\phi_2 = \tau^2$, the values σ^2 and τ^2 describing the within- and between-groups variances. There may not be any fixed parameters at the first stage, as when the within-variances are supposed different, at σ_i^2, and given a distribution at the second stage, as with the means. It is possible to extend the number of stages in a hierarchical model, for example by adding a third stage to eqns [5] and [6] by supposing θ_2 depends on (θ_3, ϕ_3) expressed through

$$p(\theta_2|\theta_3, \phi_3) \qquad [7]$$

Such an extension would be appropriate for a two-way analysis of variance; the first stage describing the variation within cells of the two-way layout, the second concerning the row and column means (the main effects), the third involving the interactions between the main effects. Any Bayesian model is, in a sense, hierarchical, the two stages being $p(x|\psi)$ and $p(\psi)$ respectively, but the terminology is usually confined to the models just described. A further extension is to include regression effects. For example, eqn [5] may be extended to

$$p(x|z, \theta_1, \phi_1)$$

where z is an observed regressor variable. Similar regression effects may be introduced at other stages in the hierarchy.

Returning to the two-stage model in eqns [5] and [6], notice that x and θ_1 are random, whereas ϕ_1, θ_2, and ϕ_2 are fixed, and the stages describe the joint distribution of the random quantities, given the fixed ones, θ_2 and ϕ_2 having no effect on x except through θ_1. This lack of effect can be expressed in the form of a directed graph, or influence diagram, which clarifies the hierarchical form. The two-stage model is represented in the figure, the lack of links from x to θ_2 and ϕ_2 expressing the feature. The extension to more stages is easily apparent.

As with the basic model in eqn [1], the Bayesian approach would add a probability distribution $p(\phi_1, \theta_2, \phi_2)$ for the fixed parameters and hyperparameters. A joint distribution for all the quantities, random and fixed, is not thereby specified unless the additional assumption is made that, given (θ_1, ϕ_1), x is independent of (θ_2, ϕ_2). This assumption is usually made, often tacitly. The independence assumption is also reflected in the directed graph by the lack of links already mentioned. There may be additional links unless the quantities $(\theta_1, \theta_2, \phi_2)$ are independent. Since the probability structure is complete, it follows that every quantity has its probability structure defined, under any conditions expressed in terms of the quantities of the problem, which probability can be found following the usual rules of the probability calculus. In particular, the posterior distribution of any of the parameters or hyperparameters, given the data, may be determined.

Inference in Hierarchical Models

We now return to the simple case where the observations are divided into m groups, each of size n, and possess the normal, independent distributions described by eqn [3]. Suppose that the common variance within groups, σ^2, is known. The extension to unknown variance presents complications that do not affect the general thrust of what follows. If the means $\{\theta_i\}$ are fixed, then eqn [3] completes the specification of the model and inference about them is ordinarily performed either by least-squares, or by maximum likelihood, the two methods here being equivalent, with the result that θ_i is estimated by the group mean

$$x_{i\cdot} = \sum_{j=1}^{n} x_{ij}/n \qquad [8]$$

with variance σ^2/n. Suppose, in contrast, the means are random and this randomness is expressed by the second-stage assumption eqn [4], where again τ^2, the between-group variance, is supposed known. Applying either of the inferential methods here gives another estimate for θ_i, namely

$$\left(\frac{nx_{i\cdot}}{\sigma^2} + \frac{x_{\cdot\cdot}}{\tau^2}\right) \Big/ \left(\frac{n}{\sigma^2} + \frac{1}{\tau^2}\right) \qquad [9]$$

with variance $(n/\sigma^2 + 1/\tau^2)^{-1}$, in the form of a weighted average of the group mean $x_{i\cdot}$, which was the estimate in the fixed case, and the overall mean $x_{\cdot\cdot} = \Sigma x_{i\cdot}/m$, the weights being inversely proportional to the variances, σ^2/n and τ^2 respectively. It is often said that the effect of randomness in the

group means is to shrink the fixed estimates towards the overall mean. An important feature of the shrinkage is that the apparently best (worst) groups with highest (lowest) values of $x_{i\cdot}$ will have their estimates decreased (increased) and, as a result, the group differences will be diminished. Notice that if τ^2 is large, the shrunk means approach the usual ones. The shrinkage feature is important in comparisons of the θ_i, for example in the construction of league tables (Goldstein and Spiegelhalter, 1996), or in census returns for different communities (Ericksen et al., 1989).

In the Bayesian paradigm all the unknown quantities will have a probability distribution, in particular $(\theta_1, \theta_2, \ldots, \theta_n, \sigma^2)$ in the normal, one-way case in eqn [3], irrespective of whether the means are fixed or random. One possibility is for the θ_i to be provided with the second-stage distribution eqn [4] and finally (μ, σ^2, τ^2) given a distribution. If, as above, the variances are known, only the distribution of μ needs additionally to be specified. If it too is supposed normal and the variance taken to be large in comparison with σ^2 and τ^2, eqn [9] is the mean of θ_i, given the data (and σ^2, τ^2). Thus the Bayesian approach favors the shrunk estimate whenever the second-stage distribution is thought to be of the form in eqn [4], which might be appropriate for sires but not with the dilution experiment. For a Bayesian, there is no real distinction between the fixed and random effects; what differences there are depends on the specific form of the second-stage distribution, and perhaps on the quantities of interest. For example, interest may centre on τ^2, the variance between means, rather than on the individual values θ_i. The situation is in marked contrast to other views where, as we have seen, the estimates of the means depend on whether or not the means are fixed or random; also the sample variance-components in the analysis of variance have different interpretations, in the fixed case being a measure of the differences between the specific means, in the random case referring to the population variance τ^2.

Returning to the general, statistical model in eqn [1] with data x and parameters ψ, it is often hard, especially when the data are numerous, to specify the required density $p(x|\psi)$. In general, whenever there are a number of quantities $u_1, u_2, \ldots, u_s$, it is difficult to describe a joint density $p(u_1, u_2, \ldots, u_s)$; an easier course often being to think about the quantities in some order and structure a series of conditional distributions $p(u_1)$, $p(u_2|u_1)$, $p(u_3|u_1, u_2)$ etc. This is essentially a hierarchical model except that, as explained earlier, it is usual to have the distribution of one quantity dependent only on the immediately previous one and not on all the previous ones; $p(u_3|u_2)$ without reference to u_1. In general, the order in which the quantities are introduced may be arbitrary, but in the hierarchical case this does not arise since the order is naturally dictated by the situation. For these reasons, hierarchical models have proved very popular in the description of complicated cases, enabling them to be broken down into stages, each of which is simple, and yet where they combine together to form a whole that reasonably describes complicated reality.

Types of Hierarchical Models

There are few hierarchical models in which it is possible to obtain explicit, analytical results for the inference desired. An exception is the normal, linear model of which eqns [3] and [4] provide a special case. Generally, at the first stage

$$x \sim N(A_1\theta_1, C_1) \qquad [10]$$

where $x(n \times 1)$ and $\theta_1(s \times 1)$ are vectors, and $A_1(n \times s)$ and $C_1(n \times n)$ are matrices. A_1 is known, θ_1 is unknown. Usually C_1 is known, the simplest case, or known up to an unknown multiplier, though it is possible to describe the distribution of its elements in a second stage. Equation [10] expresses the usual linear dependence of x_1 on θ_1 and is basic to least squares, where θ_1 is estimated by $(A_1^{\mathrm{T}}C_1^{-1}A_1)^{-1}A_1^{\mathrm{T}}C_1^{-1}x$. The second stage imposes a similar structure on θ_1,

$$\theta_1 \sim N(A_2\theta_2, C_2)$$

with obvious extensions to further stages as required. Explicit results are provided by Lindley and Smith (1972) using Bayesian ideas, though many of the results can be interpreted sensibly without invoking a distribution on the final hyperparameters, as was seen in the special case.

Similar ideas had previously been used, starting in the 1960s, by Henderson in genetics and specifically in animal breeding; see Henderson (1984). These were outside the usual statistical paradigms and remained unappreciated in broader contexts. An admirable statistical survey of Henderson's and related work is provided by Robinson (1991).

Another field in which explicit results have been obtained, though usually of an asymptotic form, is that of Empirical Bayes. This is not always considered a hierarchical model but does fit into the general framework above. We illustrate with a simple case again involving several groups and data $\{x_{ij}\}$ but this time with independent, Poisson distributions of means μ_i, the same for all observations in group i. This describes the first stage of the hierarchy. At the second stage, the μ_i are supposed iid with some unknown density $p(\mu)$. The model might be suitable when the groups refer to runs in an industrial process. A distinction from the model above is that hyperparameters are avoided and a nonparametric approach adopted at the second stage; no restrictions, other than of a mild nature like continuity, being placed on $p(\mu)$. The observed distribution of the group means $x_{i\cdot}$ provides information about $p(\mu)$. Despite the nomenclature, the analysis is ordinarily not Bayesian. A good account is provided by Maritz and Lwin (1989). The term has also been used in connection with the equation-based approach mentioned later in Section Equation-Based Approach.

Hierarchical models have also been successfully applied to stochastic processes. These may be spatial but here an exposition in the more usual temporal terms will be used. It is often reasonable to suppose that there is an underlying development process taking place over time, but that one's observation of it is disturbed by error, these two features providing the two stages of the hierarchy. A simple example is to suppose an observation x_t at time t depends on the state θ_t of the process then, with a superimposed error ε_t,

$$x_t = \theta_t + \varepsilon_t, \quad \varepsilon_t \sim N(0, v_t) \qquad [11]$$

whereas the process is linear, autoregressive with

$$\theta_t = a_{t-1}\theta_{t-1} + \eta_t, \quad \eta_t \sim N(0, w_t) \qquad [12]$$

$t = 1, 2, \ldots$. Equation [11] is termed the observational equation, eqn [12] the system equation; the two sets of error terms

being supposed individually independent and independent of each other. The approach is usually Bayesian with $\{v_t\}$, $\{w_t\}$, and $\{a_{t-1}\}$ supposed known, at least in the simpler cases, and an initial distribution supposed for θ_0. If this last is normal, it is straightforward to update by Bayes to obtain successively the distributions of θ_t given $x^{(t)} = (x_1, x_2, \ldots, x_t)$, the observations up to time t. Often the primary purpose of the study is to forecast the future state of the process, θ_{t+1}, given the current data $x^{(t)}$,

$$p\left(\theta_{t+1}|x^{(t)}\right) = \int p(\theta_{t+1}|\theta_t)p\left(\theta_t|x^{(t)}\right)\mathrm{d}\theta_t$$

involving the system equation and the posterior distribution of θ_t. A full account is provided by West and Harrison (1989).

As previously mentioned, hierarchical models are especially useful in describing complicated, but realistic, situations, where the individual stages in the hierarchy are relatively easy to assess. Nevertheless, apart from the cases outlined here, analytical results are difficult to obtain because the integrals that arise in the probability calculations are not expressible in standard forms, so that resort has to be made to numerical methods. In one sense this is no hardship, since the data are already numeric and in any application one only requires answers for that specific data set. On the other hand, the integrals are typically in high dimensions where numerical results are hard to come by. An important, recent advance has been to use Markov-chain, Monte Carlo (MCMC) methods which themselves depend, like the hierarchical models, on conditional distributions. There has therefore been a recent explosion of papers using MCMC to handle these models. A summary is given by Brooks (1998).

Equation-Based Approaches

Hierarchical models are often described in an alternative terminology as multilevel, our stages being replaced by levels. An example is provided by students, at the first level, being in classes at the second, which form schools at the third. It is also common to alter the emphasis and not talk in terms of probability, as here, but in terms of equations which incorporate a probabilistic element, so that eqn [3] would be written

$$x_{ij} = \theta_i + \varepsilon_{ij} \qquad [13]$$

with ε_{ij} being an error term, of zero mean. Complete adherence to eqn [3] would in addition require the error terms to be independent, normal and of constant variance. It is usual to employ matrix notation, as in eqn [10], and a popular model is

$$y = X\beta + Zu + \varepsilon \qquad [14]$$

Here y, replacing x, is the observed data, dependent on observed covariates X and Z; whilst β is a set of unknown, fixed parameters, u a set of random quantities and ε the error term. Thus ε is at the first level and u at the second level. A further complication, that X is only observed with error, is sometimes included, so that

$$X = x + \eta$$

in terms of the unknown, true value x and error η at another level. This generalizes the problem of regression with both quantities subject to error. We shall refer to this whole approach as equation based, rather than probability oriented, though it is possible to pass from one to the other, as between eqns [3] and [13]. These ideas have been used in longitudinal studies where several observations are made on an individual over time, forming one level of variation, another level being that between individuals.

The distinction between the approaches is not confined to the model description but includes the analysis, where manipulations of equations replace the probability calculus. Thus eqn [14] leads to estimates $\widehat{\beta}, \widehat{u}\ \beta, u$ given by

$$X^TX\widehat{\beta} + X^TZ\widehat{u} = X^Ty$$

and

$$Z^TX\widehat{\beta} + \left(Z^TZ + I\right)\widehat{u} = Z^Ty$$

under simple assumptions about u and ε. Some of the methods that are used do not employ the full probability structure but only refer to the first and second moments, a popular variant of least squares being quasi-likelihood. Other methods are based more closely on likelihood and variants thereof and often embrace ideas associated with the general, linear model. Lee and Nelder (1996) provide a good account with a lively discussion in which R.L. Smith suggests disagreement between their results and those produced by the fully Bayesian approach. This is not surprising since, as has been shown in Section Inference in Hierarchical Models, Bayesian procedures employ more shrinkage than some other methods.

An issue of the *Journal of the Royal Statistical Society A* (162, 1999, 269–448) is devoted to articles on "Applications of random effects/multilevel models to categorical data in social science and medicine" and provides many examples of the ideas here briefly described. The book by Goldstein (1995) is relevant; he and his colleagues have provided a computer package (1998) to handle many models. Similar ideas have been put forward by Bryk and Raudenbush (1992). Best et al. (1996) present a Bayesian approach, whilst Spiegelhalter et al. (1998) supply some computer facilities.

Hierarchies and Markets

Oliver E Williamson, University of California, Berkeley, CA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Hierarchies and markets are herein described as alternative modes of governance, the main purpose of which is to economize on transaction costs. It originates with path-breaking contributions by Karl Llewellyn (1931) on contract law; John R. Commons (1932) on the need to come to terms with the three conditions of conflict, mutuality and order; Ronald Coase (1937) on the need to make provision for positive transaction costs; and Chester Barnard (1938) on the neglected importance of coordinated adaptation. These fundamental ideas were joined and operationalized in the 1970s as Transaction Cost Economics took shape and has been a work in progress since. Not only does a predictive theory emerge, but a large and growing empirical research literature that is broadly supportive has taken shape. Public policy ramifications proliferate.

Whether the first market entailed the exchange of nuts for berries on the edge of the forest or the first hierarchy involved leadership for the hunt of a wild boar, it is clear that markets and hierarchies go back to antiquity. It is also clear that organizational innovations in both markets and hierarchies have contributed significantly to economic progress.

As between the two, markets have the better reputation among economists. That goes back to Adam Smith (1776) and continues today. Thus, whereas Smith celebrated autonomy, specialization, and the marvels of the market, he had grave concerns over the separation of ownership and control in large joint stock companies and the excesses of managerial discretion that accrued thereto. Indeed, but for grudging acceptance of economies of scale due to technology, hierarchy since has been under a cloud. Only recently has a symmetrical approach to organizations of all kinds – markets, hierarchies, bureaus – begun to emerge.

Foundations

The neoclassical theory of the firm that had taken shape by the 1930s described the firm in technological terms – as a production function – to which a profit-maximization purpose was ascribed. The adverse consequences of monopoly, monopsony, and monopolistic competition were all readily displayed with, this abstract apparatus, but issues of organization – hierarchy – were scanted by this black-box construction.

That, however, began to change with the appearance of radical new ideas about organization by, economists (Coase, 1937; Commons, 1932), lawyers (Llewellyn, 1931), and organization theorists (Barnard, 1938). Coase advanced the proposition that firms were not preexisting technological entities but that firms and markets were alternative modes of organization. Whether the firm should make or buy was, thus, not, technologically determined (although the condition of technological separability between stages was relevant) but needed to be derived. Coase further averred that the choice between market and hierarchy was decided principally by transaction cost differences. The canonical problem, then and since, for the theory of markets and hierarchies, was that of vertical integration.

In principle, this choice was easy: holding technology constant, the firm should produce to its own needs when the transaction costs in the firm were less than in the market, and it should buy in the market when this difference was reversed. Awaiting, however, a predictive theory of when transaction costs went one way rather than another, that remained a tautological construction. Thus, although after-the-fact choices could always be rationalized in transaction cost terms, that were undisciplined, and such ad hoc explanations were understandably met with grave skepticism. The twin ideas of treating firms and markets as alternatives and of appealing to transaction costs to explain the allocation of activity between them nevertheless turned out to be very fruitful.

Coase went on, moreover, to pose two deep puzzles. If the market is a marvel, why do we see so much activity organized in firms? And if the firm enjoys management advantages over markets, why is not everything organized in one large firm? Any would-be theory of firms and markets needed to come to terms with both of these issues.

Commons' approach to economic organization was different than but also complementary to that of Coase. Commons was intensely aware of the tensions that beset organization and averred that "The ultimate unit of activity … must contain in itself the three principles of conflict, mutuality, and order. This unit is a transaction" (1932). Not only does the triple to which Commons referred – conflict, mutuality, and order – prefigure the idea of governance, in that governance is a means by which to achieve order, thereby to mitigate conflict and realize mutual gains, but viewing the transaction as the unit of analysis turns out to be very instructive.

Llewellyn took exception with the legalistic way in which both lawyers and economists viewed contract. Rather than interpret contract in the prevailing legal rules tradition, Llewellyn advanced the more elastic concept of contract as framework, according to which a contract between two parties "almost never accurately indicates real working relations, but … affords a rough indication around which such relations vary, an occasional guide in cases of doubt, and a norm of ultimate appeal when the relations cease in fact to work" (1931). Llewellyn's ideas prefigure the concepts of incomplete contracting (as against the complete contracting tradition in both law and economics) and of private ordering (as against court ordering).

Barnard brought his experience as a businessman and his instincts as a social scientist to the study of complex organization. Interestingly, both the economist Hayek and the organization theorist Barnard agreed that adaptation was the central problem of economic organization. But whereas the adaptations to which Hayek (1945) referred were autonomous adaptations in the market, the adaptations to which Barnard referred entailed "the kind of cooperation among men that is conscious, deliberate, purposeful" (1938). These two work out of different mechanisms. Autonomous adaptations of a spontaneous kind are made in response to changes in relative prices signaled by the market; cooperative adaptations of an intentional kind are implemented through administrative processes within firms. Adaptations of both kinds being crucial to a high performance economy, there is a need to treat hierarchies and markets in a combined way.

This collection of deep insights – from economics, law, and organization theory – provided an interdisciplinary, foundation for a science of organization. Aside, however, from work at Carnegie (by Simon (1947, 1957) and by Cyert and March (1963)), much of which was inspired by Barnard, such a program was slow to take shape. Instead, many of the prescient insights from the 1930s remained fallow for the better part of the next 35 years. The pressing but unmet needs were (1) to combine and (2) to operationalize these profound insights. Law, economics, and organization theory needed to inform one another, thereafter to be joined in a predictive theory of economic organization.

Operationalization

Work of a combined kind got under way in the 1970s (Williamson, 1971, 1975, 1979; Alchian and Demsetz, 1972; Jensen and Meckling, 1976; Klein et al., 1978) and has grown exponentially since. Six key moves in the progressive operationalization of the markets and hierarchies research program are sketched here.

Human Actors

According to Simon (1985), "Nothing is more fundamental in setting our research agenda and informing, our research methods than our view of the nature of the human beings whose behavior we are studying." Both the cognitive and self-interestedness features of human actors are crucial to the economics of organization.

Bounded rationality, according to which behavior is intendedly rational but only limitedly so, gradually has supplanted hyper-rationality as the basic cognitive condition. Opportunism, whereby economic actors are sometimes given to strategic behavior, has come into common use to describe self-interestedness. Bounds on rationality notwithstanding, economic actors are also presumed to possess foresight, which is crucial to the Commons triple. Taken together, these three attributes lead to the following: (1) all complex contracts are unavoidably incomplete (bounded rationality), (2) contract as mere promise unsupported by credible commitments poses hazards (opportunism), and (3) parties who are alert to prospective hazards will work out the ramifications and factor these into the organizational design (foresight).

Transactions

If the transaction is the basic unit of analysis, then the key dimensions with respect to which transactions differ need to be named and the ramifications worked out. Among the main attributes of transactions are: (1) the frequency with which transactions recur, (2) the uncertainty (disturbances to which transactions are subject), and (3) the condition of asset specificity. This last attribute has reference to the degree to which the assets that are used in support of a transaction can be redeployed to alternative uses and users without loss of productive value. Asset specificity takes several forms, of which physical asset specificity (specialized dies), human asset specificity (firm-specific learning), site specificity (locational), dedicated assets, brand name capital, and temporal specificity are leading types. A condition of bilateral dependency develops when significant investments in transaction-specific assets are made. Inter-temporal governance complications arise as a consequence.

Organization

Alternative modes of organization are described not in marginal but in discrete structural terms, which is to say that each mode of organization – market, hybrid, firm, and bureau – is described as a syndrome of internally consistent attributes. Key dimensions for describing alternative modes of governance include (1) incentive, intensity, (2) administrative controls, and (3) the contract law regime (Williamson, 1991). (The market mode – with strong incentives, limited controls, and legalistic dispute settlement – favors autonomous adaptation; the firm mode – with weak incentives, extensive controls, and internal dispute resolution – favors cooperative adaptation.) The upshot is that alternative modes have distinctive strengths and weaknesses. They differ from one another in kind rather than in degree.

Whereas standard economic theory describes the firm as 'a point or at any rate a black box,' the economics of organization maintains that 'firms are palpably not points.' They have internal structure. This structure arises for a reason (Arrow, 1999). The markets and hierarchies research paradigm describes the firm as a complex hierarchy in which both governance and specialization purposes are served. Cognitive and behavioral variance among the human actors in the population presents opportunities for specialization; and transactions for which cooperative adaptations are needed (namely, those for which assets are highly specific and need to be adapted to successive disturbances, given that contracts are incomplete) are ones for which added governance supports are needed. The concept of firm-as-governance structure – as a means by which to induce order, relieve conflict, and realize mutual gains for transactions that are in need of cooperative adaptations – thus comes to the fore.

Note that both with respect to the unit of analysis (the transaction) and the concept of the firm-as-governance structure, the study of economic organization operates at a more microanalytic level of analysis than had been customary in

economics (Williamson, 2008) – broadly in the spirit of Simon's observation that (1984: p. 40):

> In the physical sciences when errors of measurement and other noise are found to be of the same order of magnitude as the phenomena under study, the response is not to try to squeeze more information out of the data by statistical means; it is instead to find techniques for observing phenomena at a higher level of resolution. The corresponding strategy in economics is obvious: to secure new kinds of data at the micro level.

Refutable Implications

Most of the refutable implications pertaining to governance are derived from the discriminating alignment hypothesis, according to which transactions, which differ in their attributes, are aligned with governance structures, which differ in their cost and competence, so as to effect a (mainly) transaction cost economizing result. Vertical integration in intermediate product markets is the canonical case, in relation to which a large number of variations on a theme have been worked out – for labor markets, capital markets, vertical market restrictions (such as franchising), regulation (and deregulation), economic reform (especially privatization), and public bureaus. More generally, any problem that arises as or can be posed as a contracting problem can be examined to advantage in transaction cost economizing terms.

A second class of predictions arises in conjunction with specialization. Upon making provision for variance among human actors (in cognitive and self-interestedness respects), many opportunities to realize economies by matching the attributes of human agents to the needs of a task present themselves. This second class of predictions has been less thoroughly worked out but constitutes a promising research opportunity.

Empirical

Some theories of economic organization make little effort to advance refutable implications. Among those that do, few are empirically tested. Simon (1991) evidently believes that transaction cost economics is remiss in empirical respects: awaiting empirical testing, the new institutional economics and related approaches are acts of faith, or perhaps of piety.

Coase had registered similar concerns about the dearth of empirical work on contract and organization 20 years earlier, but that was before the operationalization of transaction cost economics had begun and predicted alignments were advanced. Empirical applications of transaction cost economics got under way in the 1980s and have since grown exponentially. It could have been otherwise, but the theory and evidence display remarkable congruity (Masten, 1995). As Joskow (1991) puts it, "this empirical work is in much better shape than much of the empirical work in industrial organization generally."

Combining refutable implications with empirical testing has been denoted as the fourth precept of pragmatic methodology (Williamson, 2009), broadly in the spirit of Nicholas Georgescu-Roegen's (1971) statement that although 'The purpose of science in general is not prediction but knowledge for its own sake' prediction is nevertheless 'the touchstone of scientific knowledge.' As most economists know in their bones, theories that are more congruent with the data are also more influential.

Full Formalization

The 1930s was the decade when the informal ideas for a new science of organization took shape, the 1970s was the decade when these ideas were worked up in a preformal way, the 1980s was the decade of semiformal analysis, and the 1990s witnessed a burgeoning of work of a fully-formal kind. The article by Grossman and Hart (1986) on *The Costs and Benefits of Ownership* was the first fully formal model of an incomplete contracting kind. Hart's book on *Firms, Contracts, and Financial Structure* (1995) elaborates upon and develops these ideas. Additional work of this kind has been published since and more is in progress. As, matters stand presently, however, there is a huge gap between the semiformal and fully-formal stages.

A leading reason for the break is that the fully formal analysis of incomplete contracts relies entirely on property rights assignments to assess comparative efficiency. Not only are the discrete structural differences in organization among alternative modes of governance denied, but the proposition that adaptation is the central problem of organization (of which two types are distinguished) is ignored. These differences are consequential, whence Kreps (1999) concludes that "If Markets and Hierarchies has been translated into game theory using notions of information economics, it is a very poor translation … In particular, mathematical-based theory still lacks the language needed to capture the essential ideas of bounded rationality, which are central to … transaction costs and contractual form." Kreps (1999) nevertheless remains sanguine that formal efforts will succeed eventually, possibly with the benefit of new mathematical apparatus. Full formalism efforts to accomplish this purpose are works-in-progress (Tadelis and Williamson, 2013).

Conclusions

Whereas once it was customary to talk about markets or hierarchies, where the former denoted decentralization and the latter central planning, that has changed. Now it is more customary to talk about, markets and hierarchies. That entails much more than a replacement of the conjunction 'or' by 'and.' It represents a veritable sea change in the way economic organization is studied. The combined study of law, economics, and organization that is herein described (1) involves comparative institutional analysis in which economizing is the main case and the action resides in the attributes of human actors, transactions, and governance structures, (2) generates numerous refutable implications, (3) invites empirical analysis, (4) has many public policy ramifications, and (5) invites progressive formalization. Many economists are now persuaded that the study of economic organization needs to be studied in a combined way in which law, economics, and organization are joined. Legal scholars have

incorporated many of these ideas into contract law, corporate governance, antitrust enforcement, and regulation. And organization theorists have come to appreciate the pervasive reach of economizing reasoning.

As discussed by Williamson (2010), new problems and challenges appear to be unending. Productive tension between transaction cost economics and each of the parts on which it stands – law, economics, and organization – can be projected safely into the future.

Higher Education Management

Abstract

Higher education management concerns the complex set of actors and processes responsible for decisions within universities. Higher education management is a historically recent phenomenon and linked to changes of the institutional form of the university. Traditionally, universities have been governed or administrated while not 'management.' The focus of this article is on four main issues: (1) the study of the university as a special organization; (2) the managerial revolution in higher education; (3) management roles and effectiveness; and (4) the further study of management in higher education.

Higher education management concerns the complex set of actors and processes responsible for decisions within universities and other higher education organizations about their goals and means (human and physical resources). The role of management is a multifunctional one: strategic leadership and institutional entrepreneurship, decision making, and negotiation, day-to-day management, custody of institutional values, mediation between the organization and its environment. It is a complex one, internally embedded into a technostructure of specialized knowledge and participation in decision making, and into a more or less shared responsibility with the academic professionals; externally bound to the complex environment of higher education organizations: governmental policies for the funding and regulation of universities (in many countries including their decision-making structures and the roles and responsibilities of the leadership and management itself); the behavior and strategies of other universities, of research funding organization, of students, parents, and other stakeholders; and wider societal expectations on the role of higher education.

Higher education management is a historically recent phenomenon and intimately tight to changes of the institutional form of the university as an organization. Traditionally, universities have been governed or administrated while 'management' has been thought of as a term and practice from the business world alien to them. The study of higher education management is thus also a relatively recent field of scholarly interest. The focus of this article is on the rise of the managerial function in higher education, and four main issues will be discussed: (1) the study of the university as a special organization; (2) the managerial revolution in higher education; (3) management roles and leadership effectiveness; and (4) the further study of management in higher education.

The University as a Special Organization

For decades, students of organizations have characterized universities as a specific kind of organization and have developed highly influential concepts addressing the limited rationality of organizational behavior based on the study of the university, such as 'organized anarchy,' 'garbage-can decision-making,' 'loose coupling,' 'professional bureaucracy,' 'leadership and ambiguity' (Cohen et al., 1972; Cohen and March, 1974; Mintzberg, 1993; Pfeffer, 1977; Weick, 1976). Organizational management played a minor or ambiguous role in this perspective. The study of the university highlighted its fragmented nature within decentralized structures, the important role of the academic collegium in its self-governance, weak capacities to govern decision-making processes from the top, the professional value of academic freedom; an organizational form that seemed coherent with the unclear and ambiguous core technologies of the university and the consensus-based nature of scholarly communities within universities. While many properties of the university can be found in other organizations (schools, knowledge-intense firms, professional public sector organizations), universities provide a unique mix of characteristics that are a challenge for leadership and management.

The traditional university resembles the characteristics of the 'arena,' an organization guided by public authorities and academic professionals, rather than by goals and decisions generated at the apex of the organization. In arenas the members perform their activities relatively free from the control of the leadership; there is a blurred hierarchy or more than one, such as a hierarchy of professionals for academic affairs and a hierarchy of bureaucrats for financial and administrative issues. In consequence, universities are characterized as being bottom-heavy, fragmented into numerous academic communities with low potency for collective action. Universities are held together by bureaucratic-administrative rules and procedures, and the values and norms of academic communities. Organizational leadership and management are weak compared to other organizations. Organizational change takes place mainly through continuous local adjustments, while major change is difficult to achieve. Central organizational policies are often responsive rather than proactive, and interventions on this basis may have only minor, local effects.

This perspective is gradually changing reflecting an ongoing sociopolitical struggle about the institutional form of the university as a public agency, a cultural institution, or a knowledge business (Bleiklie, 1998). The rise of management in higher education reflects re-definitions of the socio-economic role of universities, changes in their regulation and funding as well as wider processes of the diffusion of business-inspired organizational forms into other domains of society.

A Managerial Revolution

Traditionally, the term 'management' was not part of the vocabulary of universities except for pointing at ways of running business organizations alien to them. The university was governed and administered but not managed (Lockwood, 2011). Since the 1970s, the development is characterized by the emergence and spread of 'management' as an increasingly accepted though contested principle of organizing and leading the modern university. One indication for this trend are changes in the role of top-level and mid-level academic leadership that is expected to take over a more managerial role as well as changes in the administrative pillar of universities toward managerial roles and practices. Another indication concerns the rise of 'management talk' in universities, e.g., about line management, targets and accountability, full costing, strategic planning. Finally, concepts and practices derived from New Public Management approaches and the rise of 'managerialism' point at changing practices in the regulation and organization of universities based upon a philosophy that favors managerial authority over professional self-governance and an executive leadership style over symbolic leadership.

One of the first articles pointing at a managerial revolution (Rourke and Brooks, 1964) investigated changes in US universities; universities which had a long though contest tradition of strong presidential leadership but few practices derived from management science. Their case studies among a sample of state universities illustrate the advent of management practices indicated by the rise of institutional research, increasing gathering of quantitative data for internal policy analyses, the use of computers for administration and planning, the rationalization of the use of resources, and a new more public style of administration (internal transparency and external accountability). The influential book of Blau (1973) was among the first studies focusing on the administrative structure of universities and colleges in the American higher education analyzing the problem of reconciling the conflict between the administrative hierarchy and its requirements and the academic pursuit of scholarship. A more widespread political talk about the need for a more professional management in higher education emerged in the 1970s, namely in the UK that subsequently became a front runner and exporter of new management ideas and practices for higher education (Ferlie et al., 2008). In the 1980s, governments across continental Europe and other parts of the world began to reconsider the role of higher education and public research for society and economy, the governmental regulation and funding of universities as well as their internal administration (Amaral et al., 2003). Governmental attempts at withdrawing from a juridical and bureaucratic policy style and strengthening the strategic capabilities of universities as organizations, including their leadership and management, became a hallmark of higher education policy. New policy tools were implemented, such as political target setting, steering through indicator-based funding, contracts between governments and universities, the establishment of evaluation systems to monitor the quantity and quality of outputs, and strengthening management for internal control and strategic responsiveness.

The quality management of teaching and learning became one of the internationally most widespread developments that comprises in most cases the management of external quality requirements and related reporting, in turn calling for some processes of internal management of quality. Another widespread development concerns the rise of management of financial resources becoming the responsibility not only of central leadership offices and financial officers but of deans, head of departments, group leaders or chairs. They all gain in responsibility and use more time in understanding the resource situation and – depending on context – on resource decisions to be made in staffing, equipment, space allocation, student marketing, grant applications, and the time of the academic staff. Human resource management and performance management, namely in the context of evaluations, entered the university by introducing organizational peer reviews, staff appraisals and measurable quantitative indicators opening academic activities to internal and external scrutiny. Next to that, organizational policies of setting priority areas for research and teaching touch upon the academic heartland of universities. Such attempts to control academics' work are a considerable source of tension between their professional values and priorities, and the leadership and management of universities. Estate management also evolved over time – especially when universities already held or were taking over ownership for their campuses and facilities, and when physical interfaces with their environment emerged, such as joint public/private laboratories science parks, innovation or entrepreneurial centers. Technology management, brand management, and risk management entered universities as well (for an overview on the spread of management in universities, see Lockwood, 2011). Over time, management sediments into the organization vertically to the faculty, the department, the group, the individual; and horizontally across the structures and activities of the university.

In the broadest sense, organizational responses to environmental change have been identified as the main drivers for this spread of management in universities. In one influential school of thinking, the functional need for management arises – just like in business, even though much later – from the increasing scale and complexity of higher education and research (Cameron and Ulrich, 1986). Educational expansion leads to massification, a growth and diversification of the student body as well as of the higher education institutions hosting them. Research experiences its own expansion in terms of 'big science' with its permanent need for new and costly infrastructure. Technology also becomes more important for teaching inside and outside the class room. Internationalization in its various forms (of the student body, of academic staff, of curricula, of the campus) creates a need for more planning and management. Financial efficiency, difficult choices about the use of scarce resources and pressures for effective accounting, fuel the rise of university management and related offices for fundraising, auditing, financial reporting, and management.

In a second school of thinking, management or rather 'managerialism' forms part and parcel of an ideologically motivated political project of New Public Management (Reed, 2002). Political reforms aim at increasing the efficiency and effectiveness of the higher education sector by reinforcing the autonomy of universities in their operations (especially in countries where universities were embedded into a tight regime

of state-bureaucratic control), enabling managerial discretion and internal control, making universities more accountable for their outputs through evaluation systems. At the system level, the introduction of competition and performance-based resource allocation are meant to increase performance under the assumption that a virtuous cycle exists between competition, managerial choices, organizational specialization, and efficacy (Braun and Merrien, 1999).

Third, neoinstitutionalists interpret such developments as deeply rooted in beliefs of modern societies that create their own 'myths of rationality.' 'Organizations' and 'management' form important principles in organizing modern societies, they penetrate and transform all sorts of social domains (Drori et al., 2006). The late rationalization of the university, in the Weberian sense of increasing formalization and standardization calling for authority and coordination (Weber, 1968), is inspired by wider powerful culture scripts about the appropriate means and ends for organizing things. Diffusion processes bring such models and scripts from other sectors of society also to the university. New Public Management inspired reform agendas are just one carrier. Other carriers include international organizations diffusing the idea of the 'managed university,' consultants legitimizing the need for better managed universities, universities offering (executive) training programs for higher education management, and higher education managers diffusing the logics of the successfully managed modern university through growing professional associations.

From a resource dependency point of view, three major rationales can thus be mobilized for the expanded role of management in higher education: Organizational survival in changing and turbulent environments depends on active management attuned to changes in resource dependencies, to meeting changing environmental demands, and to mobilizing new resources to reduce existing dependencies. Further, in a managerial and entrepreneurial climate, universities gain legitimacy by developing business-like properties (or symbolically managing their images accordingly) to show their responsiveness to the rise of the idea of the university as a knowledge firm and of modern management. Finally, managers can mobilize these arguments to claim a stronger role in representing the university as a whole to the environment and to expand their role and responsibility internally (Gumport, 2000).

While the rise of management in higher education has become an international theme, the timing as well as the breadth and depth of strengthening management differ, however, substantially across national settings. Overall, leadership and management have been promoted most strongly in higher education systems characterized by growing competition for resources on quasimarkets, rising expectations of accountability and evaluations, and governmental interventions inspired by New Public Management ideas.

Management Roles and Leadership Effectiveness

The study of management roles and leadership effectiveness is a growing while still rather limited area of scholarly investigation. Reviews of the literature (De Boer et al., 2010; Bryman, 2007; Lumby, 2012) show that most research has been undertaken in Anglo-Saxon higher education systems, most notably the United States, while increasingly so in Australia and the UK, and has been focused on those in formal leadership and management positions. On this backdrop, a trend has been observed away from academic leaders and managers being first among equals toward more overt managerial roles at the presidential/vice-chancellor level and the dean/head of department level, a move from elected to appointed offices, the recruitment of nonexecutive managers from outside of universities, and a reduction in the representation and influence of faculty in decision-making bodies. At the same time, leadership of universities and their academic units is usually still awarded to reputed academics, and their terms of office tend to be fixed-term calling attention for, both, their management responsibility as well as their further academic career and return to their peers.

Most studies on management roles rely on perception data gathered among the managers and 'their' academics and tend to fall into two camps (for a literature review and further references, see Bryman, 2007; Lumby, 2012). On the one hand, studies show, and sometimes normatively embrace, an emphasis on the import of ideas and practices from business based on the assumption that the latter are superior to the old academic leadership and public administration of universities. They highlight the emerging new roles, for example of deans, in strategic management of the university and their faculty, in operational management, human resource management and performance evaluations, the academic management of teaching and research programs, and external stakeholder relationship management. On the other hand, studies show, and sometimes normatively embrace, an emphases on the detrimental effects of the emerging management of universities on the commitment of academics; undermining a sense of collegiality, values of academic freedom and participation in decisions. They highlight the gap between academic and managerial norms and values, and the rise of management as a substitute for the fading faith into professionalism and professional self-regulation.

Some studies provide a look into the recent politics of universities as organizations and their negotiated order. Leadership authority, even in a supposedly powerful office such as the US university president, is constrained by many external and internal factors (Birnbaum and Eckel, 2005). Hierarchical power is not always exploited by formal instruments of command and control; academic management also stimulates and coordinates by means of soft steering, legitimacy and prestige. Further, the rise of leadership and management in higher education is contested by the responses of academics resisting, negotiating, or ignoring managerial practices and coshaping the exercise of hierarchical power within the organizations (Trowler, 1998). Management in universities – like in many complex modern organizations – is a multilayered phenomenon comprising not only the few in formal management offices but the management responsibilities of the many academic professionals, and the silent work of nonexecutive management staff; a perspective also highlighted in the more normative writing of Clark (1998). Management itself, especially at the academic mid-level, can be reluctant to embrace new managerial roles and practices, defending academic interests rather than managerial ones, and

buffering academic work (Deem and Brehony, 2005). In addition, in the past universities provided barely any training for academic leadership and management (Kort-Krieger and Schmidt, 1982) and 'learning by doing' tends to be the dominant pattern until today.

The latter perspective is supported by rare studies on leadership effectiveness in universities that are methodologically limited by measuring the perception of leadership effectiveness rather than the mediating role of leadership for organizational performance (for a recent overview, see Bryman, 2007; Lumby, 2012). Leadership behavior associated with effectiveness comprises many aspects that can be found in the wider leadership literature, such as personal integrity and trust, consideration, and sense of direction. Other aspects refer to an intense association of leadership effectiveness with behavior that fosters academic participation in decision making, a collegial atmosphere, the setting and defending of academic values. Establishing a vision or wider goal is another item identified for effective leadership behavior. Members of staff tend, however, to report day-to-day management as the dominant activity of leadership rather than visionary and strategic leadership. In contrast, leadership literature reporting self-perceptions of academic leaders especially at the top-level of the universities tends to be biased toward narratives of heroic leadership and successful self-representation. Overall, the literature on leadership effectiveness does, however, imply that leadership can make a difference for the academic effectiveness of a university or its subunits. Under which conditions which type of leadership would make a difference for which outputs remains, however, an open question.

Toward a Loosely Coupled Tight Organization?

The task of integrating academics and their basic units into a single organization and to align them with organizational goals, structures, and processes, has been and remains complex and difficult. There is evidence that universities are moving from being administrated to being managed organizations, that changes strengthening the strategic actorhood of the university as well as its leadership and management are taking place. Some students of higher education have argued that this move has so far been toward the 'managed professional' model of the university (De Boer et al., 2007) that follows managerial principles while retaining traditional professional values and practices. Limitations in the rise of the managerial revolution have been ascribed to the inherent technological uncertainty of their core activities; their deeply embedded fragmentation; and competing sources of coordination. Institutional forms are, however, not permanent; technical properties of outputs are socially defined; and environments and organizations can redefine their products, services, and technologies. The study of higher education management has thus a lot to offer for enhancing our understanding of the changing 'nature' of the university as an organization and the classical issue of understanding processes of organizational innovation in day-by-day management (March and Simon, 1958).

One promising line of future research concerns the diffusion, adoption and rejection of concepts, policies and practices of higher education management in the context of globalization. On the one hand, distinct national institutional arrangements as well as ways of running universities persist. On the other hand, the increasingly interconnected world of higher education fosters the diffusion of a managerial culture in higher education. It is an open question to what extent a more business-like type of management travels around the world, leads to convergence along dominant templates or a hybridization of management cultures. Another promising line of research concerns organizational in-depth studies, ethnography and longitudinal studies of leadership and management within the negotiated organizational order of universities. So far, the dominance of perception data and self-reporting is limiting our insight into the contested enactment of management in higher education, the actual managerial practices and their limitations, including the management by the 'few as well as by the many.' Finally, and given the widespread talk about management for efficiency and effectiveness in higher education, studies addressing the impact of leadership and management on the actual performance of universities and their academic units are a promising area of future research.

Higher Education Market

Abstract

The idea of markets in higher education (HE) invokes mixed reactions among academics and policy makers. Those in the global north generally associate markets with the commodification of HE and how this strips the educational enterprise of its inherent value. Issues around the creation of unevenness and the strengthening of inequality between the HE sectors across the global divide are generally not highlighted in the literature. Using theoretical underpinnings and global mobility data, this article explores factors that promote the strengthening of HE markets in the global north and those that weaken similar markets in the global south. This article argues that markets in HE tend to be exacerbating the unevenness of global HE terrains and promoting rather than removing a wide range of inequality fueled by an increasing competitiveness where survivors need to win the battle for the import of intellectual capital.

Introduction

The idea of markets in higher education (HE) is a fairly recent and highly contentious phenomenon. It is also an extraordinarily broad but under-researched field of study which includes, among others, student mobility markets; the HE funding markets; knowledge and curricula markets in HE; HE qualifications market; the public HE market; the private for profit HE market; and technology and pedagogical markets in HE. Each of these could indeed be the subject of a separate article. This article focuses on some detail on the first of these markets, as more than any other; it provides both direct and indirect evidence of the performance of other markets in HE across the globe.

Primarily, markets exist to serve the needs of buyers and sellers and, especially in the context of HE, to be platforms for the exchange of value. Essentially, sellers are motivated by a profit imperative, which tends to be unrelentingly exploitative while buyers generally look out for a bargain as they seek to meet their needs in the market while maximizing their investment. In an ideal world, markets are characterized by choice, where buyers make purchasing decisions based on a wide range of factors including product price, availability, and quality among many others. On the other hand, sellers of products and services make decisions about operating in a market based on both perceived and real need, the potential to make a profit and the presence or absence of competitors. Yet it is precisely the use of such language to analyze the new educational terrains that many people detest. 'Everything for sale,' screamed the title of a powerful critique of the marketization of UK HE by Brown and Carasso (2013) in which they make a strong argument against the growing consumerism in HE which they claim has seriously eroded the fundamental value of education.

In this article, I argue that, despite their assumed value, markets in HE tend to exacerbate polarization and unevenness across the terrains of the global HE sectors, creating a form of intellectual imperialism through which the markets of the global north cement their dominance, while the struggling markets of the global south propel rapidly into dysfunction. In pursuance of this argument, I deploy a range of theoretical perspectives, and begin with an overview of the classic market theory; the investment theory of education; the reproductive theory of education, the neoliberal theory, and the postcolonial theory. This is followed by a conceptual discussion of the key ideas which relate to the markets in HE including globalization, internationalization, and the notion of HE markets itself. A discussion of major actors in the global student mobility market will then be undertaken focusing on global mobility patterns from a point of view of both the recipient and sending countries. The article concludes with a critical discussion of the affordances and constraints associated with HE markets. It is hoped that this article will provide a different perspective to the traditional analysis of education markets we have become accustomed to.

Theorizing the HE Markets

Four broad theories will be reviewed here which shed light on the nature and performance of HE markets.

The Classical Market Theory

The classical theory exemplified in the works of Adam Smith, Jean-Baptiste Say, and Thomas Malthus and John Stuart-Mill is based on the assumption of the existence of a free market which always tends toward creating economic equilibrium. In this view, markets if left alone will maximize economic productivity. In the context of HE, if markets are allowed to operate freely, then students would make free and unfettered choices of where they want to study; institutions would decide freely what they want to teach and how, and more importantly make decisions about the price tag for their products. If, for example, enrollment in HE falls, then the institutions would respond by reducing the price. This would stimulate more interest and establish the enrollment equilibrium again. This was captured in Say's law of markets which simply states that supply creates its own demand. In other words, if higher education institutions (HEIs) create educational opportunities, then this would stimulate demand for the degree

 http://dx.doi.org/10.1016/B978-0-08-097086-8.92118-4

programs. On the other hand, demand is also seen as an effective driver of supply. Thus, demand and supply are the cornerstones of markets and they exist in a dynamic which tends toward equilibrium. That is to say, as long as universities provide the opportunities, enrollment to the programs will be maximized. Unlike the Keynesian theory, the classical theory thus sees flexibility in price as the key stabilizing factor for markets. In reality, all these claims are only partially true. First, there is little or no real political willingness among governments in the world to allow the idea of a free market to operate in HE. If this happens, the governments cede control over issues of social justice, fairness, and quality to the markets and that often becomes a recipe for loss of political control. In reality, the governments tend to show a strong hand in issues related to participation and especially to widening access to previously disadvantaged groups not only as an entirely social justice imperative, but also as a mechanism for controlling the labor markets and the creation of both educational and employment opportunities for people with little or no history and tradition of participation in HE. The establishment of structures for monitoring access, fair admissions, price control, and quality of HE programs have become an integral part of the external control of HE in many parts of the world. As such, it can be argued that the free markets theory has no place in HE. Secondly, there is insufficient evidence that price alone creates stability in HE markets. In the UK, for example, attempts to democratize the pricing of HE have led to increased volatility in the market. Indeed, the majority of universities have fixed their prices within very narrow limits of difference charging around 9000 pounds per annum (previously set at about 3000 pounds per annum). The impact of this has been to depress rather than to stimulate enrollments, at least in the short term, across the different types of universities with prospective students voting with their feet as they sought to delay the burden of increased educational costs. However, price is not the only, nor is it the most important determiner of decisions in HE participation. Maringe et al. (2009) found that prospective students were not deterred by the new fees increases announced in the UK for the academic year 2009–10 and indeed vowed to "…survive on jam sandwiches for the next three years…" for their opportunity to participate in HE. In any case, pricing appears to have an inverse relationship with decisions to purchase, in HE. Lowly priced products and educational programs are generally associated with poor quality and tend to be less preferred than highly priced programs (Foskett and Hemsley-Brown, 2001). There is more to the value of HE that transcends its pricing. For example, Maringe and Gibbs (2009: 121), observe that:

> A cheap, unaccredited internet degree programme gives you just that; a cheap and low quality product, experience, and poor financial returns, whereas a Harvard experience gives high quality and excellent returns.

The Investment Theory of HE

Human Capital Theory (e.g., Schultz, 1961; Becker, 1993; Mincer, 1974) presents HE as both a public and private investment decision for governments and its people. As a public investment, the fundamental argument is that investing in education leads to economic growth through increased productivity, social stability, and healthier lifestyles. On the other hand, as a private investment choice, investing in education leads to increased lifetime earnings for those with more years of schooling; access to better paying jobs; reduced time spent in the unemployment market; and speedier transitions to enhanced career prospects (Wahrenburg and Weldi, 2007). In the context of contemporary HE markets, evidence does not always lend full support to these claims. For example, there are imbalances and inconsistencies related to returns to investment in HE. Psacharopoulos (1994), for example, identifies such imbalances and inconsistencies in areas of gender, degrees, and subjects studied, and levels of qualifications obtained among others. In addition, the employment market does not always behave in a fair way. For example, although there is some evidence which shows that those with higher qualifications and those who have spent more years in education tend to accumulate higher earnings across the life course, there is much less evidence which shows that investing in a highly priced degree program offers higher financial returns to the graduates. Financial returns in the professions are more closely related to the reputation of the university attended. For the same job, a Harvard graduate is likely to start off at a higher salary than one from a less well known university. In addition, graduates from community colleges in the USA tend to have limited career entry opportunities compared to their counterparts from the more reputable 4-year degree offering institutions. Community college graduates also tend to earn lower aggregate salaries over the life course compared to graduates from other more prestigious universities (see, e.g., Nagler, 2007). Others have concluded that institutions in the lower ranks of prestige and reputation in HE markets only serve to reproduce social and economic inequalities in the society (e.g., Brint and karabel, 1989; Dougherty, 1994; Karabel, 1986; Weis, 1985).

Reproductive Theory in HE

Since Karl Marx wrote that every social process of production is at the same time a process of reproduction, HE has increasingly come under the sociological spotlight as a market that reproduces both success and failure across different socioeconomic groups in society. HE has been described as being more closely inclined with the values, norms, practices, and cultures of upper and middle classes rather than with those of the working-class families (see, e.g., Giroux, 1983; Bowles et al., 2001, Apple, 1978; Willis, 1983). The central thesis behind these perspectives is that education does not change society, that is, education including HE reproduces the inequalities inherent in society. Based on this theory, it can be argued that the markets in HE create and reproduce inequality. For example, there now exists a steep intellectual divide between the HE environments in the global north compared to those in the global south which in large part has been driven by the unidirectional flows of talent from the south to the north. Further, it has been observed that various attempts at creating partnerships between institutions across this divide have

widened rather than narrowed the divide despite the good intentions to the contrary. Evidence shows very clearly, for example, that talent mobility flows are unidirectional resulting in the ever increasing phenomenon of brain drain in the universities of the global south. Equally there is evidence which shows that partnerships developed from a need to correct imbalances in intellectual capital have tended to result in little gains to the host institutions in the south and have also tended to the creation of new employment opportunities for academics in universities in the global north, thereby exacerbating the brain drain phenomenon (e.g., Mohamedbai, 2013; Ishengoma, 2011).

Neoliberal Theory and Higher Education

Harvey (2005) has argued that neoliberalism has become a dominant hegemony of HE across much of the world. As an ideology, neoliberalism is based on four fundamental assumptions: the benevolence of the free market; minimal state intervention; regulation of the economy, and the individual as a rational economic actor. On many counts, in many parts of the world, these assumptions do not stand the test of contemporary HE environments. For example, in the previous section, we have seen how governments are not prepared to loosen their grip on the mechanisms and processes associated with the delivery and quality of HE. That alone negates the assumptions of a free market and of minimal government involvement. While it may be true that competition has the potential to drive improvement and quality, there is a sense in which when the competition is between or among unequal competitors, with unequal access to power and resources, then that competition may become a seedbed for the growth of inequality. Neoliberalism is about deregulation and reduced control to allow markets to establish their own equilibriums. The assumption that the establishment of equilibrium is in itself a good thing needs to be challenged. For example, an equilibrium point which accommodates fee increases in HE does little to equalize educational opportunities across the socioeconomic groups in society. Allowing institutions to determine their fee levels with no government control creates a fee market in HE which has the potential to increase rather than reduce inequalities across institutions in terms of access to resources and to program quality issues. Finally, the assumption that HE choosers are rational economic actors is, at best, ill informed and at worst reckless imagination. The theory of rational choice only works in an environment supported by valid, accurate, and accessible information. Evidence suggests that such information to support educational choices is often not available to choosers in the market (Foskett and Hemsley-Brown, 2001).

Postcolonial Theory and HE Markets

Postcolonial theory, despite the numerous contestations surrounding its definition and stature, focuses on addressing the legacy of colonialism imposed by western nations in their attempts to dominate the world through conquest and cultural influence and to create markets for their burgeoning economies back home. In general, the three southern continents of Africa, South America, and Asia have provided the intellectual space for the growth of postcolonial theory. Its definition is difficult to capture because some argue that colonialism never ends, it only transforms (Young, 2001). However, it offers a powerful critique of the underlying purposes of colonialism and its effects on the colonized. A recurring theme in these critiques is that the postcolonial nations ought to offer resistance to all forms of control and to develop a heightened consciousness about possibilities of continued and subtle control in the postcolonial era. The theories privilege the development of local indigenous knowledge systems, use and development of local languages, and the deliberate engagement of diasporas in processes that are designed to shift and transform developmental agendas. In the context of HE markets in particular, they offer a powerful critique of the deployment of partnerships as a strategy to bridge knowledge gaps between institutions in the north and those in the south. Zeleza (2009), for example, suggests that although north–south partnerships have become a strategy of choice in attempts to equalize opportunities between the global north and south, the net impact is that, because they work on donor funding models, they tend to further the interests of the donor agencies at the expense of the uplifting objectives they were created to address. Moreover, as Tickly (1999) observes, issues relating to colonial history, economic power, culture, language, gender, class, race, and ethnicity are invariably involved, but seldom addressed or openly discussed in these partnerships. Even south–south partnerships come under severe criticism using the postcolonial lens. While they are heralded for stimulating development among like-minded nations with geographic and often cultural 'samenesses,' they tend to be sponsored by organizations and institutions in the north with a typical global north perspective of development. It is thus prudent to argue that as yet, we do not have real south–south partnerships in HE, but north–south arrangements which increase the complexity of the role and nature of international knowledge hierarchies, their production, dissemination, and management. Evidence drawn from such partnership arrangements suggests that these partnership arrangements reproduce and sometimes intensify the asymmetries between north and south global actors in the HE markets (e.g., Appiah, 2004; Ishengoma, 2011; Samoff, 2004). Thus, even though many such partnerships work well, the perpetuation of structural, cultural, intellectual, and economic asymmetries and dependencies in areas of knowledge production, application, utilization, control, and legitimation continue to characterize the relationships between HE markets in the global north and south (e.g., King, 1990; Escobar, 1995; 2005; Samoff and Carrol, 2004).

Conceptual Framework for Understanding HE Markets

In this section of the article, I seek to engage critically, albeit briefly with the ideas of markets, marketization, internationalization, and globalization and the very notion of HE itself. The analysis will by no means be exhaustive given the limitations of space, but will help situate and position the article in the context of the argument it seeks to develop.

The Notion of Markets in HE

Popularized by Adam Smith as the 'invisible hand,' a market is a system through which buyers and sellers try to outsmart each other for the best returns from their investment through exchanging value. In the context of HE, one can assume that students are the buyers and institutions the sellers while the product of exchange is education. But this characterization of HE markets is incomplete, inaccurate, and problematic in a number of ways. According to Jongbloed (2003), providers or sellers in a market should have four freedoms: freedom of entry, freedom to decide the nature of their product, freedom to use available resources, and freedom to determine prices. But as we know, entry into the HE market is highly regulated and restrictive primarily because of the high stakes involved, given their role as knowledge producers in the global context. In many ways, knowledge has replaced capital as the key resource for development in a global knowledge driven society (Carnoy and Castells, 1999; Drucker, 1993; Hargreaves, 2002; Vallima and Hoffman, 2008; Harvey, 2010). The control of knowledge and its flow across the globe including its utilization and application in the world have thus replaced the flows of money as the key weapon for human development. Governments, regional bodies, and international organizations have assumed a heightened interest in what goes on in universities and in the process have substantially transformed the freedom universities have had to teach what they want, to whom they want, and in what ways they want. While the seller's freedoms can no longer be fully guaranteed in the new global climate, the buyers' freedoms have also been radically transformed.

On the other hand, as consumers, buyers in a market should enjoy four fundamental freedoms related to choice of provider, of product, and to access to full information on prices and quality (Jongbloed, 2003). Available evidence clearly shows that such freedoms do not fully exist in the HE context. For example, a recurring theme in studies on consumer choice in HE is that choice in the market is highly constrained by lack of information, insufficient, and sometimes misleading information (Foskett and Hemsley-Brown, 2001). Despite an increasing marketization in universities, HEIs have not and seem broadly reluctant, for a whole range of genuine reasons, to brand themselves as supermarkets selling degrees to anyone who brings along the money. They maintain guarded protectionism and provide restricted entry only to those deemed deserving and qualified. For these and other reasons, markets in HE are at best quasi markets. Le Grand and Bartlett (1993) for example, argue that because of external regulatory frameworks and how universities are financed, there is little that reflects a free market in the HE context.

Equally it is anomalous to speak of a single HE market. Effectively, even within the same country or system, there exist a range of different markets in HE. For example, the entry degree market differs in many ways from the postgraduate degree market in as much as these differ from distance education markets in HE. Such differences include, for example, the broad age groups targeted by these different markets; the pedagogical approaches utilized in different markets; the product structure and quality; the quality of staff associated with these different markets; the study patterns associated with program delivery among others including whether they are public or private sector institutions, and fee paying or non-fee paying and other factors which differentiate these HE markets. On a global scale, we can speak of the receiving and sending markets depending on the direction of flows of human capital based on the net flows of human capital from the global south to the global north. Similarly, the markets in different places are undergoing significant transformation. For example, the Asian HE markets, led by China, India, Japan, and South Korea are increasingly becoming attractive destinations for human capital flows in the global HE context due to significant infrastructural capital investments, less stringent human migration laws, increasing political stability, economic progress, and increasingly maturing democratic governance systems (Dahlman and Jean-Eric, 2008). On the other hand, due to a variety of push and pull factors, and driven by largely poorly performing economies, unstable governments, wars, and poor management of natural disasters, countries in the global south tend to operate in sending markets which experience severe brain drain, a phenomenon seriously eroding the value of HE in the global south. The picture of markets in HE is thus very complex and variable.

Marketization

This is a term that came into increasing use in the early 1980s, coinciding with the dawn of liberalization in HE. Essentially, the term is used to describe the processes associated with the need for increasing efficiency and effectiveness of universities in delivering their missions. The increasing competition for resources, staff, and students and the growing importance of university league tables of performance all contributed to the marketization of HE. Broadly, the marketization idea is used to describe the effects emerging from three areas.

The first is the notion of expansion of HE systems across the world, which has increased diversity on university campuses and HE systems generally. HE systems across the world have expanded significantly, partly due to industrialization and the growth of postindustrial societies which requires higher level skills to service them; partly due to the worldwide adoption of the principle of education as a fundamental human right which has been at the heart of the Education for All philosophy that has defined global educational policies; and partly due to a global social justice imperative which has led to the idea of widening and increasing participation in HE. Worldwide, it is estimated that participation in HE has risen by approximately 40% in the last 10 years (University World News, 2012). The importance of direct marketing approaches to attract more and more people to HE have thus increased and so contributing to the marketization of HE environments.

The second factor emerges directly from the phenomenon of expansion. With expansion came diversity characterized by recruitment from a wider cross-section of people and the increasing mobility of talent from different parts of the world. The HE terrains have generally become more diverse than they have been for a long time. In many countries, the diversity of campus populations has increased tenfold over the last 15 years. For example, institutional statistics in UK and American universities indicate that the percentage of international students has been doubling annually over the last 5 years (HESA UK2010/2011 and the National Center for Educational

Statistics USA, 2012). Such diversity has brought with it both challenges and opportunities to different HE markets. For example, in terms of challenges, universities have been grappling with issues of appropriate pedagogical approaches and new instructional methodologies more suited to teaching and learning in increasingly culturally and demographically diverse HE classes. In market terms, how should the educational product be more appropriately packaged to meet the diverse needs of a broader based consumer group? On the other hand, new opportunities have also emerged. For example, those created by a need to reflect upon the nature of graduate attributes in a globalizing HE environment.

The third is a more global influence which recognizes the importance of transforming HE from one driven by 'national systems that educate citizens for local employment and national service to one that is increasingly defined as an international service to be regulated through the marketplace and through international trade agreements (Bassett, 2006: 4). In pursuance of this goal, the World Trade Organization (WTO), working within the framework of the General Agreement on Trade in Services (GATS), of which HE was a significant part, proposed that HE be viewed as part of the Free Trade Agreements, which aim, among other things, to reduce or eliminate government measures that prevent services from being provided across national borders; provide the legal framework for interrogating barriers to trade in education and finally to provide a vehicle that opens markets around the world and progressively liberalize conditions which promote and support open trade in education (Popovich, 2002). The marketization of HE environments thus became a choice strategy for enhanced institutional performance through increased effectiveness and efficiency of these institutions in the new environment. However, the performances of markets in different places are at varying levels of maturity. For example, while much has been achieved to rationalize the markets of the European Union (EU), through for example, the harmonization of qualifications and years of study, quality in different parts of Europe vary quite considerably with the relatively mature markets in Western Europe having higher quality higher education than many countries in the rest of the expanded European Union.

Hence, there is a sense in which marketization has been the product of expansion, diversification, and the international consensus around liberalizing HE services in an age of increasing globalization and internationalization.

Globalization and Internationalization in HE

I have chosen to discuss these two concepts under the same heading because they are so closely interconnected although they do not mean the same. Globalization is a term that has gradually superseded the idea of postmodernism and provides a lens which helps us understand the increasing interconnectedness of the world in terms of its politics, economics, sociocultural achievements, and broad ideological dimensions of human existence. It is based on a world development theory that privileges the view of an accelerated interconnectedness and sameness facilitated through information technologies, the Internet and the World Wide Web (WWW), and the sheer power of financial and ideological might that resides within countries and institutions in the global north especially. This implies that globalization can be imposed from above, but equally that it can be contested and configured from below. However, the homogenization theory has been hotly contested. Some people think that rather than becoming more integrated, the world is increasingly showing signs of division along lines of religion and on issues of nationhood. England, for example, despite being a full-fledged member, exists on the fringes of the European Union in terms of its economic ideology and especially with regard to joining the common European Union currency. Similarly, while there seems to be much convergence on capitalism as a practical economic theory, it seems that the ideology works better in countries where the majority of the population belong to the middle class while the benefits of this economic ideology seem to be less evenly spread in countries where the working class comprises the majority of the population. Such countries tend to experience greater political instability. This unstableness in turn, tends to be replicated in the institutions of the nations including those in HE. Globalization is thus a very contentious phenomenon, which, on one hand, defines the coming together of nations in pursuit of highly connected political, economic, cultural, social, and technological goals, creating an increasingly borderless world. On the other hand, it is equally widely seen as a postmodern project aimed at cementing the hegemonies of the rich global north through the creation of highly extractive relationships with the poor nations of global south. Discourses which highlight a strong relationship between globalization and poverty (Zedillo, 2007), inequality (Robert and Lajtha (2002), increased control by rich countries (Richardson, 2002; Zedillo, 2007), and increased growth of north south extractive partnerships and dominance through soft power approaches (e.g., Appadurai, 2001; Zeleza, 2003; Mudimbe, 1994; Chakrabarty, 2000; Rodney, 1983) do now occupy a permanent space in discussions and debates related to globalization. The growth of markets in the broad context of globalization and debate around their impact on HE are thus shaped by voices on both sides of fence.

Internationalization on the other hand is sometimes seen as having preceded globalization, at least in its present form. In HE, universities have always had an international character and intent both in terms of the staff who comprise it and in the sense of the knowledge that defines their central mission. However, as globalization intensified in the last few decades, universities have in turn intensified their internationalization agendas. Knight (2004) is credited for providing the most widely used definition of internationalization as the process through which universities seek to integrate international and intercultural dimensions into the teaching, research, and service elements of the institution. Maringe et al. (2013) observe that internationalization in universities tends to be built around motives which seek to create stronger strategic and symbolic value; knowledge eminence in the global context; social and cultural prominence; stronger positioning in the pecking orders of global comparators and league tables; and the creation of economic value in an environment in which national governments are increasingly reducing their funding levels to HE. Marketing is widely seen as an integral

part of this new agenda for universities' development and the entire marketization processes tend to be developed around these new pillars of growth. Key strategies for internationalization in universities have tended to be built around increasing cross border student recruitment, the hunt for distinguished scholars to enhance the research eminence, performance profiles, and prestige of the universities; increasing opportunities for students to engage with international dimensions as part of their degree programs through joint degrees, student exchange programs and other partnership arrangements; and through curriculum transformation processes. In their recent study, Maringe and Foskett (2010) found that the priority given to these different approaches to internationalization differed between countries and tended to reproduce and cement their positions across the global divides.

The Notion of HE and HE Markets

Stoke (1966) has argued that there is little that unifies the idea of HE as it tends to come in numerous shapes and sizes in different parts of the world. However, the one universal notion that underpins the idea of HE is the aspect of knowledge. Although knowledge itself is hard to define, there seems general consensus that systems and institutions of HE rally around a call to produce, reproduce, apply, and disseminate knowledge as the key to all forms of human endeavor. A widely accepted way of defining HE is to see it as any education offered beyond the traditional school system which often results in the award of a certificate, diploma, or degree at the end of a prescribed period of study. The term tertiary education (beyond secondary schooling) is sometimes used to mean the same as HE. The problem is that there is a lot of slippage between what is sometimes offered in secondary schools and in some colleges. For example, some colleges offer secondary school subjects leading to traditional secondary level certificates and qualifications, while some universities offer secondary level studies to students in their transitional year from school to university. For example, in Zambia, students typically do their sixth year of secondary school in a university as a preparation for university studies. This makes defining HE a very complicated issue. In addition, different countries use different nomenclature to define the idea of HE. The use of the idea of HE markets thus becomes elusive in this somewhat unsystematic and confusing terminological jungle. A review of a few HE systems helps to illustrate the complexities.

A way to gain some understanding of HE markets across the world is to engage with the notion of international student mobility. This not only provides a window into a key dimension in the behavior of markets, but also sheds light on how markets in HE are perceived globally. Five key dimensions of HE markets will be explored in the context of student mobility in the next section. These include: facts and figures relating to global mobility trends in HE; an overview of the world favorite study destinations; a review of the world's biggest exporters in the student mobility market; a discussion of issues associated with emerging markets in the global south and finally, a prospective view of what I see as the future of HE markets in the next decades to come.

HE International Student Mobility Markets

The international student mobility market has become a massive financial enterprise worth more than 500 billion US dollars per year across the world. In 2012, the OECD released the following figures in relation to international student mobility markets in HE which are corroborated by figures from the UN Statistical Data on HE:

1. In 2010, more than 4.1 million students were enrolled outside their countries of origin. Based on current rates of annual growth, it is estimated that by 2025 there will be about 25 million international students studying away from their home nations.
2. Between 2001 and 2011, the number of students enrolled outside their home countries increased threefold from 1.3 million to about 4.3 million representing an annual growth rate of about 6%.
3. The global economic crisis has not resulted in a decrease of international student mobility, contrary to expectations. If anything, the figures show a slight increase during the initial years of the crisis.
4. Global student mobility mirrors to a large extent inter- and intra-regional mobility patterns. For example, the majority of international students studying in top EU destinations such as the UK, Germany, and France tend to come from European countries.
5. The majority of international students tend to study in English speaking countries. For example, the UK, the USA, and Australia together host approximately 40% of all international students worldwide.
6. Over the last few years, new players in the international student market have emerged. These include Canada, Japan, Russia, and China. Consequently, the market share of traditional international study destinations has been eroded. For example, the US market share has dropped by about 6% between 2000 and 2011.
7. The HE Fee structures send mixed messages in terms of their influence on study decisions of international students. Despite charging higher fees for international students, the USA, the UK, and Australia command pride of position in attracting the highest numbers of international students. Conversely, despite that they do not charge any fees for international students, Finland and Norway are nowhere near the top of key destinations for international HE study. **Table 1** shows FEE practices in a range of OECD countries.
8. Asian students, mainly from India and China, make up approximately 51% of all international students studying abroad.
9. Approximately 77% of all students studying abroad do so in OECD countries.
10. The top 10 nations by % of international students enrolled are summarized in **Table 2**; the USA does not feature in this list. It is also important to note that with the exception of Australia, New Zealand, and Canada, the rest of the countries with the highest percentages of international students belong to the EU.

The following provide snippets of the top three recruiting or recipient nations in the global student mobility markets.

Table 1 Fee systems in OECD countries

Fee systems for international students	*Countries*
Countries charging higher fees for international students relative to domestic students	Australia, Austria[a], Belgium[a], Canada, the Czech Republic[a], Denmark[a], Estonia[a], Iceland, Ireland[a], the Netherlands[a], New Zealand, Poland[a], the Russian Federation[a], Sweden[a], Turkey[a], the UK[a] and the USA
Countries charging same fees for both international and home students	France, Germany, Italy, Japan, Korea, Mexico, Spain, Switzerland
Countries which do not charge any fees	Finland, Norway

[a]Applies for Non-European citizens.
Adapted from Education Indicators in Focus OECD, 2013. Organisation for Economic Co-operation and Development.

Table 2 Countries with the highest percentages of international students

Country	*% of international students enrolled in HE*
Australia	21
UK	15
Austria	15
Switzerland	15
New Zealand	14
Belgium	9
Ireland	8
Canada	6
Sweden	6
Denmark	5
Iceland	4

The US HE Market

Acknowledgment of Source

All statistical figures and information quoted in this section have been drawn from the UNESCO Institute of Statistics 2012 data and the OECD statistical data on HE markets.

In the USA, HE refers to education offered beyond school level and includes a system of public and private universities, community colleges, and liberal arts colleges. The system is probably the most well funded, and its quality has been relatively high in comparison with systems elsewhere in the world. The result has been that American universities have consistently been evaluated as the most prestigious institutions. Various league tables including the highly respected Shanghai Jiao Tong University's Academic Ranking of World Universities tend to place about 40 American universities in the world' top 50 based on awards and research outputs. Consequently, American Universities tend to be the most attractive destinations for study for the ever increasing numbers of students who choose to study away from their home nations. Almost 20% of all migrant students in HE across the world choose to study in American universities making the USA the top destination for HE study. The bulk of foreign students studying at American universities are drawn from China, India, South Korea, Japan, Canada, and Saudi Arabia. Interestingly, American students who opt to study abroad do not prioritize any of these sending countries. Rather, the five top destinations for American students seeking to study abroad are: the UK; Canada; Germany; France; and Australia. The US market is a favored destination of study for a wide variety of reasons including the prestige of the US degree brand; flexibility in pathways to degree qualifications; believability of the US qualifications in global labor markets; and the liberal social and cultural environment (Douglass et al., 2011). Closely connected with the US brand is the Canadian HE market. A big draw with the Canadian HE system is that it is cheaper than the USA and yet offers comparable quality and prestige. However, the weather and relatively smaller capacity offer drawbacks in the recruitment market.

The UK He Market

Like the US, the UK HE market comprises many different types of institutions including universities, Further Education Colleges, and some publicly designated and autonomous institutions. There is only one private university in the UK (University of Buckingham), while the rest are established by the Royal Charter as public universities and are wholly or partly funded by the government. The department for Business, Innovation and Skills (2012) website lists about 750 Further Education Colleges and degree awarding institutions together with about 63 Universities. Four of its universities are consistently in the world top 10 ranked universities for reputation, research output, and awards. Cambridge and Oxford together have affiliations with nearly 50% of all Nobel Prize winners in the world. The UK is noted for its significant contribution to English literature and for its world class inventions such as the steam engine which has been central to the successes of the industrial revolution. For these and other reasons, the UK HE system is considered very highly across the world. The UK HE brand attracts the second largest contingent of foreign students after the USA. Key exporters of foreign students to the UK HE system are China, India, Nigeria, Ireland, Germany, and the USA. The UK students tend to seek foreign study experience in the USA, France, Ireland, Australia, Germany, and Canada. Like the US market, there is little reciprocal mobility across sending and receiving nations in the UK HE market.

Student mobility to the UK HE market is stimulated primarily by widespread positive perceptions of high standards, the acceptability of the UK HE qualification in the global employment market, perceptions of a stable economy and political environment; and the use of English as a medium of instruction. However, like the USA, the UK is increasingly being perceived as exerting a hegemonic dominance across the world and its unusually high fees set at 9000 pounds for domestic students and approximately 15 000 for international students are increasingly eroding the potential of the UK as a zone of possibility for those seeking to undertake their studies overseas.

The Australian HE Market

The Australian HE market is geographically positioned close to countries with rapidly expanding economies which view talent growth as central to their developmental ambitions. It is widely seen as the most developed in the Asia–Pacific region. The fact that Australia delivers its university curricula in English is a huge advantage to those who do not wish to move too far from the region to receive a good English education. The country has approximately 50 universities, eight of which consistently appear in the top 50 for research, quality, and international profiles. Like the USA, the Australian HE market has a substantial Further Education sector which accommodates a large number of students who otherwise would not enter the conventional and highly competitive university sector. Factors that appear to erode the Australian HE brand competitiveness include: relatively poor standards of accommodation for foreign students; large distances for travel from the key metropolis in the global north and very restrictive employment and immigration laws for foreign students (e.g., the Knight Review 2011).

Key Features of Dominant HE Markets

Table 3 is based on statistical data obtained from the UNESCO Institute of Statistics and the OECD Educational Statistics data. It provides a summary of data for the top study destinations in the world.

A number of important points deserve to be highlighted in respect of these HE markets:

1. Language of instruction (in this case, English) appears to be a major factor in international students' decisions to study outside of their home nations.
2. English as a language of instruction or as lingua-franca seems to exert a very significant influence in study abroad decisions (e.g., Jenkins, 2013)
3. Perceptions of the quality of HE is a very important determinant of study abroad decisions (e.g., Mazzarol and Soutar, 2002; Cubillo et al., 2006).
4. Geographical and historical factors appear to play an important role in study aboard decisions (e.g., Chia-Ling and Kot, 2011).
5. Employment prospects also play a significant role in study abroad decisions (e.g., Lin, 2007)
6. The major importing nations are perceived to offer better opportunities for employment both during the times of study and after completion of the degrees (e.g., Mpinganjira and Rugimbana, 2009).

The Market Factors Characterizing the Biggest Sending Countries

The preceding data and discussion clearly show that China and India are the world' biggest exporters of international students. Three key factors combine to contribute to this strong HE export orientation in both countries.

Population Size

According to the Wall Street Journal India (2013), the two countries are the world's most populous nations. China's population currently stands at 1 339 724 852 while that of India is 1 210 193 422, a difference of about 130 million. However, because China has a one child per family policy, its rate of population growth is becoming smaller than that of India. As such, India is expected to be the most populous nation by 2050. Of these figures, the two countries currently have the largest sizes in the youth population groups. For example, about 144 million of India's population is currently between the ages 18 and 23 years. That means the two countries are host to the largest groups of young people who will be expected to engage with HE both presently and in the future (e.g., Gupta and Gupta, 2012).

Prevailing Perception of Low Quality Across the Sector

Although both India and China have large numbers of universities and other forms of HEIs and even a lower of student per university ratio compared to the USA and the UK, there are very few institutions in both countries which compete on an equal footing with some of the leading universities in the world. For example, according to The Times HE Universities ranking, China only has three universities listed on the top 200. Peking University is the only Chinese university frequently ranked in the top 50 universities in the world. The Indian Institute of Technology at Kharagpur is the top University in India featuring between 200 and 250 on different ranking systems. Speaking at the valedictory function of the golden jubilee celebrations of the Dayanand Education Society in Latur, President Pranab Mukherjee noted: "We have over 650 degree awarding institutions and over 33,000 colleges. But we are short of good quality academic institutions, on account of which many bright students prefer going abroad for higher studies." Students with strong government and parental support thus make the choice to study abroad. For both China and India, such students prefer studying either in the USA or the UK.

Strong Government Commitment to Economic Growth

Both China and India are gradually acknowledged as the world's fastest developing economies. China is predicted to overtake the USA as the world's largest economy by 2020. There is realization that such growth can only be maintained and propelled by an equally aggressive human resources development. As such, both countries, through excellent scholarship programs send some of their brightest youth to study in US and UK top universities in critical degree programs in science, engineering, technology, medicine, pharmacy, and management. There is also very strong parental support in both countries especially among the middle classes for sending children overseas for their degree programs.

Table 3 Market performance indicators of the top six study destination countries

Top host nations	*Number of international students hosted*	*% of global quota*	*In/out bound rates*	*Top inbound courtiers*	*Top outbound destinations*	*Indicators of market advantage*	*Indicators of market constraints*
USA	684 714	19.2	3.4%/0.4%	China; India; South Korea; Japan; Canada; and Saudi Arabia	UK; Canada; Germany; France; and Australia	Prestige and quality of the US HE brand; diverse HE curricula and pathways; prestige of the US HE qualification in global labor markets; liberal sociocultural and political environment; English as a medium of instruction	The rise of the Asian HE market; negative global political image of the USA; reduced government spending on HE; increasing unemployment rates; target of acts of terrorism
UK	389 958	10.9	15.4%/0.9%	China; India; Nigeria; Ireland; Germany; and the USA	USA; France; Ireland; Australia; Germany; and Australia	Prestige and quality of the UK HE brand; prestige of the UK qualification in global labor markets; liberal sociocultural political environment; English as a medium of instruction	Increasing global competition, especially from the Asian HE sector; High fees structure for both domestic and international students; declining government support for HE; stringent immigration and employment laws for international students
Australia	271 231	7.6	21%/0.8%	China; India; Malaysia; Hong Kong; Indonesia; Singapore; and Vietnam	USA; New Zealand; UK; Germany; France; and Japan	Most developed HE in the Asia Pacific region; High quality of Education; focus on student experience and satisfaction; prospects in the employment sector; English as a medium of instruction	Stringent immigration and employment laws for immigrant students; regional differences in learning and teaching cultures; substandard housing for foreign students
France	259 935	7.3	11.5%/2.4%	Morocco; China; Algeria; Tunisia; Senegal; and Germany	UK; USA; Switzerland; Canada; Germany; and Belgium	Equal treatment of international and domestic students (i.e., same fee structure); the quality associated with French HE; the opportunity to learn French or extend knowledge in it; Vibrancy of contemporary French culture;	The language of instruction as a barrier;
Germany	200 862	5.6	Unavailable	China; Turkey; Russia; Poland; Austria; and Ukraine	Austria; Netherlands; UK; Switzerland; USA; and France	Nation with Europe's largest economy; equality between foreign and local students in terms of fees where these are paid; largely government subsidized HE with no upfront fees by all students; good employment opportunities; with BMW, Audi and Mercedes brands, the country is a favorite destination for engineering students especially	The language of instruction despite an increasing usage of English as a medium of instruction
Japan	141 599	4	3.7%/1.1%	China; south Korea; Vietnam; Thailand; Malaysia; and USA	USA; UK; Australia; Canada; and Germany	High standards of education; affordable tuition fees (almost half the cost of tuition in US universities; increasing use of English as a medium of instruction; strong and expanding economy with reputable technological brands; availability of part time jobs	The language of instruction despite an increasing use of English as a medium of instruction

Emerging Patterns of Growth in Global HE Markets of the South

The African HE market as a representative of the global south deserves space in this discussion largely because Africa still bears the scars of colonialism and perhaps more than any other continent is the best case study for understanding the contemporary dynamics of the postcolonial legacy in the development of HE.

Africa is the future of the world in terms of development. It is estimated that by 2050, Africa alone will be host to more than 60% of the world's reserves of untapped natural resources in the form of minerals, oil, and gas. Moreover, it will be the world's largest reservoir of young economically and educationally active population with approximately 25% of the entire world's young people aged 16–25 years residing on the continent. In addition, the UN Population forecasts for 2050 indicate that the largest population increases will take place in developing regions especially in Africa where the fertility rates remain higher than in developed nations and where efforts to deal with the ravages of HIV and Aids are showing significant positive impacts. This suggests that the demand for HE is likely to be very high on the continent and that a new scramble for Africa will be reinvented, both for its resources and for the growth of its intellectual talent. Current trends in the mobility of human talent in Africa suggest that this scenario will continue to accelerate both in the medium to long term. The following is a review from the Southern African Development Community (SADC) group of countries in Southern Africa.

Based on data from the OECD, the UNESCO Institute of Statistics (UIS), EUROSTAT, and the Higher Education Statistics Agency of South Africa (HESA), the following trends in student mobility markets in the SADC region have been noted:

- As a region, despite the growth of and supply for HE participation, the SADC nations have the highest outward mobility rates in the world at 6%, more than China and India.
- Despite the unprecedented growth in HE in the sector, the region has the lowest participation rates with only six of every 100 potential HE entrants being enrolled in the HE institutions of the region compared to, for example, 72% in Europe, and about 48% in Asia.
- Unlike their counterparts in other parts of Africa who prefer to migrate to the global north in search of HE opportunities, more than 70% of SADC students tend to seek their opportunities in the region and especially in South African institutions of HE.
- This internal regional mobility parallels that of the students in the EU the majority of who seek opportunities within more developed nations of the region in the UK, France, and Germany, for example. It also mirrors the SADC vision for greater regional integration and growth. This is supported by the Mwalimu Julius Nyerere African scholarship fund administered by the African Union (AU) for SADC students who want to study science and technology based degrees in African universities.
- The quality of HE in the region has also been noted to be on a downward decline largely due to inadequate funding and the migration of talent due to a wide variety of push factors (e.g., Pillay, 2010; Maringe and Carter, 2007).
- While academic mobility has positive outcomes in terms of talent development, there is evidence showing that large numbers of students from the sub-Saharan region do not return to their home countries following completion of study, contributing to a growing brain drain which has negative financial and quality implications for the region. For example, it has been estimated that almost $4billion is used to support approximately 100 000 western expatriates who are rolled in to replace the lost talent. Brain drain thus creates further employment opportunities for academics in the global north while reducing the growth of local indigenous talent to spearhead local development (e.g., Teichler and Yağcõ, 2009).
- Mauritius, South Africa, Botswana, and Zimbabwe, in that order have the highest outward bound mobility ratios in the region. Conversely, South Africa (ranks 11th as the most favored destination in the world), Mauritius and Botswana have the highest inbound ratios for international students. Reasons associated with preference for these countries include: country stability measures; economic development indicators; the quality of HE in those countries; and recognition of qualifications in the employment sectors of the region and for South Africa especially, being host to globally recognized universities which feature prominently in the top echelons of global performance tables (e.g., McGregor, 2007).
- The most preferred subjects of study by inbound students are Business Studies, Health Sciences, Social sciences, and law; Science, engineering, and Humanities in that order (HESA, 2009).
- Outside of Africa, SADC students also show preference for the UK and the USA due mainly to the reasons already explored elsewhere in this article, but chiefly because of past historical, quality, and language factors.

The North South Divide in HE Markets: Polarization, Unevenness, and Inequality

The evidence discussed here bears out the claim made in the introduction section that the HE terrains of the global north and south are increasingly becoming uneven, widening the quality and equity gap and increasingly diminishing the prospects for the knowledge bases of the south to take their place in the global knowledge hierarchies. This unevenness, polarization, and inequity are clearly demonstrated by the following:

- Net migration of talent from the global south to the global north metropolis.
- A relentless erosion of the human resources in the global south to grow the indigenous knowledge bases.
- Tendency to replace migrant talent with western talent likely to maintain the status quo in terms of a western presence and intellectual domination.
- In absolute terms, the majority of students who migrate to the global north universities for study do not return to their home nations following completion of study. It is therefore

logical to surmise that the flow of global talent is unevenly balanced in favor of the global north HE markets.

- Due to this northward bound migration, and also due to poor government support for HE at the behest of World Bank (WB) and IMF advice which favors higher investment at lower levels of schooling than at HE, the main pillars of quality in HE in the global south now stand on very shaky ground.
- The erosion of quality has fueled a down spiral which drives greater desire for migrating to the more secure institutions in the global north.
- The phenomenon of regional mobility based on the growth of regional institutions seeking greater regional integration at multiple levels is making some contribution to the stabilization of talent in the global south. However, with the growing tendency for these formations to be supported by western money, it is likely that the knowledge hegemonies of the west will continue to dominate the new partnerships formations of the global south.
- It has become almost impossible to elevate the status of indigenous languages as vehicles for HE learning in the global south because of the dominance of English both as lingua franca and as medium of instruction. The very basis for privileging indigenous knowledge systems in the global south has thus suffered a knockout blow in the race for cultural and intellectual domination.
- Other factors and conditions which contribute to poor economic performance of global south markets, such as civil wars, disease, and poor governance among others are increasingly hypothesized as being linked to hidden western agendas which see opportunities for continued control over resources of institutions and organizations in the global south. In 'How Europe underdeveloped Africa,' for example, Rodney (1972) showed that, despite shipping huge quantities of resources to Europe from Africa over five centuries, no meaningful development has occurred on the continent. In addition, the fabric of human consciousness, the African condition and culture was plucked away through systematic destruction of core cultural values and the adoption of western forms of knowledge and values to which the local ones were to either exist as the poor second cousin or be completely decimated from the arena of their lives.
- The dominance of the global north in the control of knowledge depositories and disseminators suggests that knowledge hierarchies based on the north will continue to dominate those in the global south.

Conclusions

Discourses of HE markets have tended to privilege global north perspectives and have not sufficiently engaged with post/anticolonial epistemic and oppositional perspectives which represent more accurately the development of HE in the global south.

The discourses in the global north tend to critique HE markets in the context of the commoditization/commodification in an increasingly consumer-led HE environment. Little space is given to postcolonial and anticolonial theory as lenses through which HE markets can be analyzed. Such analysis as shown in this article uncovers new understandings which help to bring the global south into the spotlight. Beyond the responsibility for guarding against the excessive commodification of HE, placing the global south into perspective uncovers a broader range of issues which may be increasing the global inequalities in HE. Mobility patterns in HE markets clearly demonstrate a strengthening and weakening of the global north and global south HE markets, respectively. This exacerbates the unevenness that characterizes markets in these places creating an issue of intellectual dominance in the way these markets operate.

This article deliberately does not offer solutions to these problems as this has not been the primary intention. However, if it has made any contribution, it is that the north–south divide, which western discourses generally silence, signals a source of tension beyond the conventional arguments about markets and the commodification of knowledge. Such tensions cannot be ignored any longer even though the solutions may lie beyond the HE sectors themselves.

Higher Education Research

Abstract

Higher education research is a small field as compared to the size of the higher education system. As a theme-based field, it is expected to strive both for academic quality and practical relevance. Many scholars involved address this area only occasionally, and more research is linked to administrations or external stakeholders than based on academics. The borderlines are fuzzy between researchers and practitioners active in gathering information as a basis of reflection and improvement. It is a growing field, though uneven across countries, with a widening thematic scope: Notably, comparative studies got momentum and internationalization became a major theme.

Introduction

All efforts in the past to characterize the situation of higher education research have come to similar conclusions:

- It is a small field of research. When looking at the substantial size of higher education systems all over the world and their important role in society, we have to come to the conclusion that systematic knowledge on higher education is not held in high esteem even today.
- It is a theme-based field that is expected on the one hand to strive for quality as far as theories, methods, and field knowledge are concerned as the established disciplines and on the other hand to legitimize its existence through being highly relevant for higher education policy and practice.
- Most scholars undertaking – occasionally or frequently – research in this area do not consider themselves to be higher education researchers, but rather as belonging to a certain discipline: education, psychology, sociology, political science, economics and business studies, law, history, etc. For them, higher education is just a thematic area, not a core element of their own academic identity.
- Higher education is a field of expertise where the borderlines are very fuzzy between research on the one hand and consultancy, evaluation, and other search for evidence on the other hand. The borderlines are fuzzy as well regarding the respective persons: researchers on the one hand and on the other hand consultants, evaluators, and 'reflective' policy makers and practitioners. For example, most journals in this domain provide a platform for both scholars and other 'experts.'
- Most higher education research are national in focus or concentrate on individual institutions or their subunits. Research with a worldwide focus or international comparative research in this field has been by no means frequent in the past. In recent years, however, a broader perspective is on the way: Internationalization of higher education has become a major theme of analysis, comparative studies gained momentum, and we note an increase of international cooperation and communication among the respective researchers.
- The conditions for this field of research vary substantially across countries. There are enormous differences in the size of this field: In some countries, higher education research is a noteworthy field (e.g., in the United States of America and China), while in other countries it is marginal or nonexisting. In some countries, we note a clear dominance of one or two types of institutional bases, e.g., notably faculties of education and 'institutional research,' while in other countries research is widely scattered.

We should add that it is a growing field: Developments such as the growth of the higher education system, the increasing strategic orientation of higher education management and policy, the growing emphasis on evaluation- and evidence-based action, the professionalization trends within higher education, and the widening of communication beyond regional and national horizons call for improved basis of systematic knowledge.

The aim of this article is to provide an overview primarily on the setting of higher education research: The characteristics of a theme-based field, the diversity of institutional bases and persons involved, and the thematic range. This will be intertwined, however, with glances at the substance and major findings of this field.

A Theme-Focused and Practically Relevant Field

The respective key literature underscores that higher education research is a theme-focused area of research: It addresses higher education (or tertiary education), its functions, institutional settings, and social context. Here, much is in common with other areas of behavioral and social sciences that gained attention and support for its thematic focus. Actually, some activities in this domain touch upon neighbor areas of thematic research, e.g., science of science, youth research, labor market research, or research on competences.

Higher education research does not have the typical basis of legitimacy as classical disciplines within universities and other institutions of higher education. It is not viewed as having emerged from the logic of the knowledge system, but rather from practical demands for knowledge. As a consequence, it has to find ways constantly to be both, respectable as a discipline in theoretical depth, methodological quality, and breadth of field knowledge and as a provider of a valuable knowledge base for policy and practice.

 http://dx.doi.org/10.1016/B978-0-08-097086-8.92120-2

Higher education research draws from a multitude of disciplines, notably education, psychology, sociology, political science, economics and business studies, law, and history.

It is linked to many interdisciplinary areas as well. For example, Clark (1984) included in his overview on research fields 'the political view,' 'the organizational conception,' and the 'the policy perspective.' In 1992, an encyclopedia on higher education names among 'disciplinary perspectives on higher education' also 'anthropology,' 'linguistics and rhetorical studies,' 'literature,' 'science studies,' and 'women's studies' (Clark and Neave, 1992).

Actually, various key thematic areas of higher education gain from ties to a variety of disciplines or interdisciplinary areas; e.g., research on the relationships between higher education and the world of work benefits from the knowledge of economics, sociology, and psychology as well as from interdisciplinary research on labor markets, professions, personnel management, competences, etc.

Higher education research, as many thematically defined fields as well, is disadvantaged vis-à-vis typical disciplines in various respects:

- The institutional basis within the academic domain of universities often is feeble and unstable.
- There are widespread claims that the theoretical and methodological advancements of behavioral and social sciences are stronger, if they are discipline-based, and that multidisciplinary areas just borrow from the disciplines and lack academic rigor.
- Often, theme-based fields do not have a visible educational role in terms of separate study programs and doctoral training activities. This makes the field vulnerable as far as institutional stability and 'self-reproduction' of future generation of scholars are concerned.

The development of higher education research is clearly supported by practical needs. A first trend report published in the early 1970s (Nitsch and Weller, 1970–1973) showed that it had been a marginal field in most countries of the world until the 1960s. It began to grow as a consequence of three developments: First, the growing belief fueled by concepts of economics education that an increase of postcompulsory education was essential for economic growth; second, a spreading conviction – reinforced by the student protests in the 1960s – that higher education was not functioning properly through incremental self-regulation and improvements, but rather faced substantial features of crisis that needed strategic responses; and third, the actual rapid expansion of higher education called many traditions into question.

The strong impact of policy and practice on higher education research is mirrored in the fact that the majority of research activities in this domain are undertaken outside academia. Moreover, research undertaken in the academic domain often is funded for practical purposes, and changes quickly thematic priorities in tune with the public discourse: Higher education research is likely to grow in areas, when respective problem awareness surface and reform efforts gain momentum, and is likely to grow overall, when sweeping broad-ranging reforms are underway, e.g., in Europe early in the twenty-first century in the wake of the so-called 'Bologna Process.'

The practical interest in knowledge about higher education, however, does not turn out to assure consistently a solid support for research in this domain:

- Academics and other representatives of higher education tend to believe generally that progress and innovation depend on the generation and interpretation of systematic knowledge. When it comes to higher education policy and practice as such, however, the belief is widespread, however, that firsthand experience and reflection on the part of the knowledgeable actors themselves are sufficient basis for wise strategic action.
- Policy makers and practitioners often advocate a tailor-made information gathering expected to serve decisions ('evidence-based' policy based on 'policy-based' research). As a consequence, many of the respective analyses lack a thorough theoretical basis and methodological soundness as well as a critical questioning of conventional wisdom.
- The rapid pace of changing political issues causes difficulties for higher education research in serving the reflection of these issues. Often, information is lacking when an issue surfaces; as a consequence, often poorly founded systematic information is put before. In turn, support for research often fades away when the respective theme is not anymore in the limelight of public debate, even though systematic information remains relevant as a basis of continuous improvement.

Certainly, higher education research constantly has to find ways to strike a balance between theoretical, methodological, and field knowledge consolidation like any discipline and to serve the needs of problem identification and problem solving like any applied field. The growing popularity of terms, such as 'mode 2 research,' 'targeted research,' etc., indicates that this is a typical challenge for many areas in the behavioral and social sciences.

The Variety of Institutional Bases and Roles of Those Undertaking Research

Trend reports and other overviews (Nitsch and Weller, 1970–1973; Fulton, 1992; Sadlak and Altbach, 1997; Teichler and Sadlak, 2000; Teichler, 2005; Altbach, 2009; Davis et al., 2010) show three striking features of higher education research as regards the institutional basis and the persons involved.

- An enormous heterogeneity according to country: While higher education research is fairly widespread in some countries, it is almost nonexistent in others.
- A diversity of institutional bases, whereby more research seem to be undertaken outside the typical domain of academic units at higher education institutions.
- A wide range of persons involved – from full-time research to occasional involvement, from an emphasis on academic values to practice- and service-oriented information delivery.

As regards country, the US is often been named as the one with the largest number of persons and research activities in the field of higher education. Actually, however, the respective

absolute figures in China seem to have become even higher in the wake of recent educational expansion. Relative to the population, the size of higher education as a field of research is more impressive in some small countries, e.g., Australia and Finland. In contrast, research in this domain is scarce in many southern European countries as well as in many low- and middle-income countries, even some improvement can be observed there as well (see, e.g., Brunner, 2009; Horta and Jung, 2013).

The scarcity of higher education research in low- and middle-income countries can be demonstrated by an example. In the context of a major project undertaken in the first decade of the twenty-first century under the umbrella of UNESCO, issues of higher education, research, and innovation were analyzed worldwide. While the project coordinators succeeded in forming a Europe–North America committee composed almost exclusively of respective researchers, policy makers, and practitioners clearly dominated as a consequence of scarce research potentials in the other regional committees (Meek et al., 2009).

As regards institutional basis, analyses available (cf Schwarz and Teichler, 2000) opted for different classifications, because not a single classification is commonly agreed among the respective experts and the ways of institutionalization vary from country to country.

El-Khawas (2000) identified three separate bases of higher education research in the US:

- 'Research': Academically based higher education research often is institutionalized in university units of teaching and research. Academics strive for a strong theoretical basis and the pursuit of knowledge for its own sake.
- 'Policy': Higher education policy research or information units are established by or linked to governments or other suprainstitutional actors. They aim at enriching the policy process through information and policy-driven interpretations.
- 'Practice': Various universities establish research and development units linked to the institutional management. This 'institutional research' is expected to provide information and action-oriented interpretations for the actors within the individual institutions – similarly as policy research serves macrosocietal actors.

Teichler (2005) names six types of institutional bases:

- Higher education research alimented by teaching, i.e., visibly institutionalized in units in charge of teaching and research – in some countries as a branch field in faculties of education. Notably in the US, a substantial number of master and doctoral programs focus on higher education and are expected to serve both the reproduction of scholars and the training professionals in charge of management support and services at higher education institutions: "The larger and more research-oriented programs include the University of California at Los Angeles, the University of Southern California, Pennsylvania State University, the University of Michigan, Michigan State University, the University of Pennsylvania, and several others" (Altbach et al., 2007: p. 6). Similarly, institutes of higher education with a relatively long tradition in doctoral education in China are those at Xia Men University, Peking University, East China Normal University, and Huazhong University of Science and Technology. Similarly, the Centre for Higher Education at the Institute of Education, University of London, might be named for the UK.
- University-based centers for higher education research: Some universities have opted for separate research units that can draw from a broad range of disciplines, concentrate fully on research, and aim to strike a balance between the quality criteria of academic research and relevance for policy and practice: e.g., the Research Institute for Higher Education of the Hiroshima University (Japan), the International Centre for Higher Education Research of the University of Kassel (Germany), the Center for Higher Education Policy Studies of the Twente University (the Netherlands), and the Center for the Study of Higher Education of the University of Melbourne (Australia).
- Units for research and practice, combined at institutions of higher education, e.g., in the area of 'staff development,' 'teaching and learning,' or 'didactics of higher education.' They are expected to train teaching staff, assist curricular innovation, etc., and, concurrently, to conduct research to assure a sound knowledge base in their area of practice.
- Institutional research – a term having emerged in the US for research units within the administration of individual higher education institutions: They collect systematic information as a basis for the reflection of institutional policies. This idea spread worldwide – however with different connotations. For example, the European Association for Institutional Research (EAIR) did hardly become a training ground for similar institutionalization, but rather served the dialogue between higher education researchers and higher education policy makers and practice (see Begg, 2003).
- Nationally sponsored research institutes for higher education: In various countries, institutes or other units were established outside higher education institutions. They might be sponsored by governments, foundations, or other external stakeholders. A typical example is the Nordic Institute for Studies in Innovation, Research and Education in Oslo (Norway), or a large research institute in Hannover (Germany), recently renamed German Institute for Higher Education Research.
- Higher education research as subunit or subfield of an institute with a broader thematic range: e.g., in the Institute de Recherche sur l'Economie de l'Education, Université de Bourgogne in Dijon (France).

One might add as a newly spreading mode institutes jointly supported by several universities, e.g., the Centre for Research in Higher Education Policies in Portugal and the National Higher Education Research Institute in Malaysia.

In looking at the persons involved in research on higher education, we can observe an even broader range. In addition to researchers at the various types of institutions named above, we note on the one hand a significant number of scholars of various disciplines not considering themselves to be higher education researchers, but undertake research in this domain occasionally. On the other hand, many policy makers and practitioners only embark occasionally in activities that can be

named research on higher education (Teichler, 2005; cf also Teichler, 1996) suggested grouping persons involved six categories. They are:

- The discipline-department-based occasional researchers on higher education: They devote part of their time or stages of their career to the thematic area, but see their identity in a discipline and consider research on a variety of thematic areas as natural. They contribute to theoretical and methodological enhancement of research in this field, but often lack the breadth of the field knowledge of higher education. Well-known examples of analyses based on such a background have been 'The Organization of Academic Work' (Blau, 1973) and 'The American University' (Parsons and Platt, 1983).
- The discipline-based continuous higher education researchers: Being based in disciplinary units they devote most of their research to this thematic field. They might be strong in theory, methodology, and field knowledge, but they often care little about higher education policy and practice. For example, references in major encyclopedias suggest Clark (1983), Bourdieu (Bourdieu and Passeron, 1997; Bourdieu, 1984), as well as Becher and Kogan, (1990) had a substantial impact on the conceptual discourses on higher education.
- The scholars based in higher education research units: They often excel as regards field knowledge, they try to strike a balance between the quality criteria of academia and relevance expectations of policy and practice, and they frequently draw from various disciplinary areas. Again a look at encyclopedias and overview books suggests that Trow (1973) and, subsequently, Geiger (1986), Teichler (1988, 2009) as well as Neave and van Vught (1991), and others played a role in agenda setting.
- The applied researchers: These are persons active in units of 'institutional research' or similarly, in institutes located outside higher education institutions (e.g., government-sponsored research institutes). The prime emphasis is to collect systematic information relevant as 'evidence' for decision making.
- The consultants (including evaluators) could be viewed as a mix between the applied researchers and the reflective practitioners. They draw from all kinds of systematic knowledge or practical experience and generate here and there systematic knowledge to advise practitioners whereby the fit of information and advice is a major concern.
- The reflective, occasionally researching practitioners: These might be managers (e.g., university presidents), 'higher education professionals' (experts in charge of service or management support functions), experts in special agencies (e.g., evaluation and accreditation agencies), etc., for whom secondary analysis of research, systematic reflection, and occasional studies might be part of their role and professional self-understanding.

The breadth of institutional bases and of persons with different professional roles involved in higher education research certainly can be viewed as a wealth for the overall knowledge base of the research field. However, most authors of overview reports perceive higher education research as fragmented, because most institutions and persons involved communicate and cooperate or generally pay attention primarily to their respective peers rather than to the field of higher education research as a whole.

The Thematic Range

Overviews on higher education research present varied classifications as well of the themes addressed. Some examples might be presented here (cf Teichler, 2005; Horta and Jung, 2013):

- Some analyses underscore a divide between research addressing the educational domain (teaching and learning, curricula, competences, etc.) and the policy domain (organization, management, funding, etc.): Separate 'continents,' 'archipelagos,' or similarly (see Macfarlane, 2012);
- Teichler (1996) notes four distinct areas of expertise among higher education researchers: quantitative-structural, knowledge- and subject-related, person-related as well as teaching- and research-related, and finally organization- and governance-related aspects.
- The major encyclopedia (Clark and Neave, 1992) is divided into eight areas: national systems of higher education; higher education and society; the institutional fabric of higher education; governance, administration, and finance; faculty and students; teaching, learning, and research; disciplinary perspective on higher education; and academic disciplines.
- Tight (2003) presented eight different areas in academic publications: teaching and learning, course design, student experience, quality, system policy, institutional management, academic work, and knowledge and research.
- Finally, the journal *Research into Higher Education* Abstracts names eight categories as well: national systems and comparative studies, institutional management, curriculum, research, students, staff, finance and physical resources, and contributory studies and research approaches.

These classifications aim to be useful across countries and over time. This does not mean, however, that research in this domain is similarly spread across countries or over time.

Thematic priorities by country certainly reflect major issues of higher education policy and practice. For example, macro-societal issues seem to play a stronger role in countries where governments play a strong steering role. Research is also influenced by its institutional setting: Educational issues of higher education are more likely priority areas in countries in which academic higher education research is predominantly located in faculties of education. However, many themes are popular across countries – may it be as a consequence of similar problems or as a consequence of the activities of international organization to stimulate international debates on common issues.

Thematic priorities seem to change over time along policy priorities. Overview reports point out that certain themes that were in the limelight of the public discourse at a certain period, also drew attention of higher education researchers at that time and were similarly popular across economically advanced countries and to some extent as well across other countries. Certain thematic priorities are frequently named.

- In the 1960s, higher education expansion, the relationships between expansion and economic growth as well as issues of equality of opportunity, etc.
- In the 1970s, students, teaching and learning, institutional diversification, higher education planning, graduate employment, etc.
- In the 1980s, evaluation, management, quality of research, etc.
- In the 1990s, system governance and institutional management, incentive steering, internationalization, etc.
- In the twenty-first century, globalization, 'rankings,' 'employability,' 'learning outcomes,' 'knowledge society'/ 'knowledge economy,' competition and market steering, professionalization, etc.

No thorough overview reports are available on higher education research in middle-income and low-income countries. Certainly, in addition to the themes named above, policy agendas of the World Bank and to some extent of UNESCO play a role: education and income, privatization of higher education, the role of tuition fees, financial matters, and finally the role of higher education in economic and social development.

Bibliographic analyses have been employed to get a more precise overview on the thematic development of higher education research. The value of such analyses, however, is limited.

First, the publication strategies and activities are heterogeneous among the institutions and persons involved. The academically based researchers on higher education spread their key publication across various types of publications: disciplinary journals and books; specialized publications on higher education; publications serving both, academics as well as policy makers and practitioners; sources published by governments, international organizations, and other stakeholders; and publications specifically addressing policy makers and practitioners. Some applied researchers and practitioners occasionally involved might choose the same sources; however, many of their texts are available as institutional reports, 'gray literature' or are viewed as 'internal' information.

Second, many publications in this domain do not fit into divides that prevail in bibliographic analyses. For example, only few journals on higher education can be defined as purely academic. Among those in the English language with an international authorship and readership, Higher Education and Studies in Higher Education (the highest rated ones by the European Science Foundation) can be named genuinely academic. Other international journals, in contrast, have fuzzy borderlines between research and policy/practice; they at least occasionally publish texts written by policy makers and practitioners (e.g., Higher Education Policy, Tertiary Education and Management, Journal of Studies in International Education, or European Journal of Higher Education).

Third, bibliographic studies on the international scene of higher education research mostly focus exclusively on publications in the English language. In most countries, however, higher education research has kept a strong national focus, and publications in the native language dominate: They certainly comprise nine-tenths among the major publications in China, France, Germany, Italy, Japan, Spain, and Central and Eastern European countries. As a consequence, e.g., an analysis of higher education research in Asia based on journals in the English language names almost twice as many articles from Hong Kong, where English dominates, as from Japan and five times as many as from Korea (Jung und Horta, 2013). In Latin America, the common dominant use of the Spanish language obviously facilitates regional comparisons. Only higher education researchers from a few small countries, e.g., Finland, the Netherlands, and Norway, publish so much in English that publications in English provide a sufficient insight into the national scene.

This language bias is further reinforced by the fact that some of these analyses are based on journals in the English language among which only some can be viewed as genuinely international while others primarily cater scholars from a single or a few Anglo-Saxon countries. As a consequence of such a mix of sources, Tight (2003) notes that as many as one-third of authors in 'specialist higher education academic journals' published outside North America are British; according to the numbers of authors frequently named in the references, Tight (2012) seems even to suggest that half of the leading higher education researchers are from the UK.

There is a wealth of documents on the state of higher education research, e.g., publications on the activities of international associations – such as the Consortium of Higher Education Researchers (CHER) (Kehm and Musselin, 2013) and EAIR – as well as reports on the national scene of higher education research – e.g., on Canada (Jones, 2012), Germany (Gunkel et al., 2003), and Japan (Kôtô kyôiku kenkyû no seidoka to kadai tokushû, 2013), but secondary analyses would be needed in order to draw conclusions of trends as far as the institutional basis, the types of persons involved as well as the concepts, methods, and themes are concerned.

Finally, one feature that is hardly discussed in the analyses of the state of research should not be overlooked: As a rule, higher education research does not discuss the substance of the knowledge system, e.g., that of physics or youth research, and higher education researchers, as a rule, are no experts on the substance of the knowledge system beyond their own disciplinary background. One could argue that higher education research focuses on the nonessential issues of the knowledge system, i.e., on the framework in which knowledge operates, and is incomplete by definition. If it wants to be complete, collaboration with specialists of the respective disciplines is needed.

The Growing Supranational Reference of Higher Education Research

Higher education has a strong national focus, and many studies pay attention to a few institutions or even single cases, even though it is viewed as surpassing borders in many respects as a matter of procedure: Knowledge is universal in many disciplines as well as regarding the logic of science. Academics like to cooperate internationally, international academic reputation is viewed as the most desirable, and cosmopolitan values are widespread in academia. However, higher education is shaped nationally, regionally, or even locally as regards supervision,

funding, organizations, personnel policies, institutional patterns and diversity, curricula, and its various links to society.

In three respects, research on higher education clearly surpasses national frameworks. And its supranational reference has increased substantially in recent years.

First, international comparative analyses (see Teichler, 1996; Välimaa, 2008; Kosmützky and Nokkola, 2014) play an increasing role. Information collection across countries is often characterized as a 'gold mine' to free oneself from believing that features of higher education in the vicinity are typical and rational for higher education per se. Macrosocietal phenomena, such as institutional or program diversity, cannot be analyzed without international comparison. Moreover, supranational perspectives play a key role in the link between higher education research and policy: We observe a constant search for better solutions, and benchmarking is the basic methodology. Supranational organizations played a significant role for the establishment and improvement of higher education research since about the 1960s. While many experts believe to grasp higher education in their home country without a systematic research basis, understanding the international variety of higher education obviously does not seem to be possible without gathering information systematically. Also supranational agencies, such as the OECD, the World Bank, UNESCO, the Council of Europe, or the European Community, played a major role in stimulating comparative studies and discourses of the most 'modern' or the most 'successful' models of higher education (see Sadlak and Hüfner, 2002).

Second, higher education research increasingly addresses border-crossing phenomena. The trends of 'internationalization' and 'globalization' of higher education became major themes since about the 1990s, and they are paid more and more attention every year. Frequent themes are 'mobility of students and academic staff,' 'mutual influences of higher education systems on each other,' 'internationalization of the substance of teaching, learning, and research,' 'institutional strategies of internationalization,' 'knowledge transfer,' 'cooperation and competition,' and 'national and supranational policies regarding the international dimension of higher education' (Kehm und Teichler, 2007). In recent years, the term 'globalization' got momentum – i.e., a term implying a declining relevance of borders amid increasing border-crossing activities. For example, the individual universities are increasingly viewed as acting primarily on a global arena, whereby the popular 'rankings' of 'world-class universities' are often referred to as the most visible phenomenon of this kind.

Third, communication and collaboration among researchers and other experts on higher education have grown substantially. This helps overcome the limitations of conceptual frameworks shaped by nationally bound experiences, strengthen the knowledge basis of comparative studies as well as do genuine comparative analyses through the development of joint conceptual and methodological frameworks, and make the field of higher education research, often relatively small within individual countries, more visible.

Supranational organizations built up expert groups from different countries and stimulated international expert studies. Higher education researchers themselves were also active in establishing international associations. In Europe, e.g., the – British-based – Society for Research into Higher Education, established in the 1960s, was internationally active from the outset. Cooperation spread in the framework of supranational associations, e.g., the European Association for Research and Development of Higher Education, founded in the 1970s and later substituted by the International Consortium for Educational Development. EAIR emerged in the late 1970s as a branch of the US-based AIR, but became an independent association stimulating communication between scholars and practitioners. CHER was founded in the late 1980s to strengthen the quality and the comparative thrusts of higher education research. Though these associations themselves are not carriers of comparative research, they certainly contributed to a growing number of international research teams undertaking jointly comparative studies, e.g., on the student life and study, graduate employment and work, the academic profession, governance and management of higher education, etc. (cf Brennan and Teichler, 2008). The growing strength of comparative analysis can be demonstrated, e.g., through a comparison of the major encyclopedias on higher education (Clark and Neave, 1992; Forest and Altbach, 2006).

The increasing international communication among higher education researchers is linked with a more widespread use of English as the Lingua Franca. For example, the most highly reputed international academic journal of this domain, i.e., Higher Education, still had 63% of its authors between 1993 and 1997 from the four major Anglo-Saxon countries (21% from the UK), 13% from other European countries, and 24% from other countries or jointly from different countries. In the years 2001–04, already more than half of the articles were from other countries than the four Anglo-Saxon countries, among them 29% were from other European countries, while only 12% were from the UK (Teichler, 2005), and this trend toward a broader international coverage has gone further in the mean time. Yet, most publications on higher education remain to be published in home-country languages. The spread of the English language hitherto has led to less concern of collecting information with the help of different languages, and information on higher education available in the English language remains enormously uneven.

Higher Education – A Small Academic Field and Abundant Knowledge Production by Diverse 'Experts'

If the field of higher education is viewed merely as an academic one, we might find a few thousand academics all over the world, for whom this thematic area is the core of research or one of the major themes and for whom research in this area is the source of professional identity. Their neighbors are scholars either considering themselves as representatives of disciplines, who address higher education occasionally, or as specialists of neighbor thematic research areas, e.g., science of science or sociology of the professions. This academic field can be described, as other academic areas, with reference to specialized institutional settings, research (and possibly teaching) activities, academic associations, and academic publications.

Of course, academically based higher education researchers are linked to the real world of higher education by analyzing its current state and changes; among others, they try to predict future developments of higher education in order to identify challenges for research on higher education (see Brennan and Teichler, 2008).

But higher education research as a field with a thematic focus is not legitimized merely by its inner academic life, but concurrently by its delivery of relevant systematic information that helps policy makers and practitioners to reflect the state of affairs in higher education and generate ideas for improvement. Such reflections, however, draw from research or other activities of generating knowledge more or less systematically on the part of hundreds or thousands of persons. Some clearly are researchers as well: In units linked to the administration of individual institutions of higher education (often called 'institutional research'), state institutes, and units linked to external stakeholders, consulting agencies, etc. The total number of higher education researchers in those settings certainly is larger than those in academic settings. Moreover, there are large numbers of higher education professionals involved in systematic data gathering – evaluators, international officers, and program coordinators who undertake surveys of the experiences of the persons for whom they have to take care in their practical assignments, etc. Moreover, there are many university leaders, academics of various disciplines, consultants, or other experts who embark in systematic knowledge production in one way or other.

The borderlines between respectable systematic and not so systematic information, between academically sound and not well-based information, between information on the one hand and advertisement and propaganda on the other are fluent. In some way or other, all these researchers and other experts compete in gathering and distributing information to those in charge of higher education. Two examples might illustrate this.

First, prior to the 2012 follow-up ministerial conference in the framework of the Bologna Process, the hosting Romanian government and others responsible to coordinate the activities between the conferences invited more than 60 experts to summarize the available information relevant for the overall assessment of the Bologna Process (see Curaij et al., 2012). According to those responsible, this activity "aimed at bringing the researchers' voice into higher education international level policy making," and it gave "an unprecedented opportunity for researchers dealing with higher education matters to interact and contribute to the political process shaping the European Higher Education Area, as well as national policy agendas" (Curaij et al., 2012: p. v). Among the actual authors of this collection of analysis calling for a high level of systematic knowledge, less than one-third can be viewed as typical higher education researchers, while a higher proportion of them are scholars who at most occasionally address higher education, and an almost as high proportion are experts in various policy and coordination agencies.

Second, the 'rankings' of 'world-class universities' are a politically very powerful tool of systematic information in the form of indicators on the 'quality' of universities. They are the product of 'experts.' Some of the higher education researchers with an academic base are directly involved in the production of the rankings, others embark on in-depth discussions of methodological improvement while accepting the political steering role of the rankings, other develop alternative measures, and finally others criticize both, the concepts and methods as well as their ideological underpinnings. This involvement of academics in various respects indicates that higher education research is not an academic field that can live more or less independently from other somewhat systematic knowledge production on higher education.

Thus, higher education as an academic field of research is not clearly separated and embedded in a multitude of other scholars and experts. It constantly has to strike a balance between academic quality and relevance as well as between strengthening its own academic territory and playing a convincing role for policy and practice among the multitude of knowledge producers.

Major Findings

Higher education research covers such a multitude of issues that one can hardly sketch its major findings. The growth of student numbers certainly has been consistently viewed as caused by rising features of educational meritocracy as thus by a growing demand of individuals, but it remained to be viewed as controversial as regards the human resource demands of the world of work: Notions of 'overeducation' competed with claims that societal modernization and economic growth call for an expansion of higher education. Higher education is viewed as serving society through intellectual enhancement, cultural development, stimulation of technological innovation, provision of trained human resources, and contribution to critical thinking, but neither the respective needs of society nor the contributions of higher education are predictable: Most studies are based on the assumption that some kind of a balance is needed between academic freedom to ensure room for unpredictable developments of the knowledge and soft pressures to safeguard that relevance is on the agenda. Many studies as well identify a vulnerable balance between academia being self-controlled by the experts of systematic knowledge on the one hand and on the other the demands of relevance and efficiency: As a consequence, many studies addressed the strength and weaknesses of steering on the part of various actors, e.g., academics, governments, university management, and external 'stakeholders,' or various mechanisms, e.g., legislation, evaluation, and incentive steering. Most recent research on higher education notes a growing exposure of higher education to an increasing range of diverse expectations in the wake of what is called 'knowledge society' as well as increasing weight of border-crossing activities and even crumbling of borders toward a world of higher education system and a global society. Consequences for higher education as such hardly can be identified anymore because a growing diversity hardly leaves any common features. The preponderance of search for improved organizational solutions obviously calls for more integrated views on higher education: "How do changes in the organisation of higher education institutions relate to changes in intellectual programmes, agendas and advances?" (Brennan, 2008: p. 192)

Abstract

Raul Hilberg, born in Vienna, was an Austrian-American political scientist most famous for his massive volume, *The Destruction of the European Jews*. The volume, derived from his dissertation, used archival material to document the role of German bureaucracies under National Socialism in the Holocaust. Though subsequently considered to be the definitive work on the Holocaust, public unwillingness to scientifically analyze the horrors created difficulties in publishing and distributing the work. After its publication, Hilberg analyzed the role of the railroads in the Holocaust and then the relationships between perpetrators, victims, and bystanders during the Holocaust. His later publications reflect on the interpretation of archival material related to the Holocaust.

Raul Hilberg's reputation rests on a single, albeit monumental work: *The Destruction of the European Jews*. When the first version appeared in English in 1961 no one could have foreseen that it would become a standard work in the social sciences. At that time, the 'Holocaust' did not exist as a concept either in academic discourse or the mass media. Nevertheless, with his first publication Hilberg found he had plunged into the turbulent waters of public debate both in Germany and in the USA. The *New Yorker*'s publication in installments of Hannah Arendt's reportage *Eichmann in Jerusalem* had created a sensation in the United States because it held the Jewish Councils partly responsible for the efficient functioning of the machinery of mass murder under the Nazis. Her study of 'the banality of evil' drew extensively on the findings in Raul Hilberg's book which had only recently appeared and was still largely unknown. It is an irony of history that when Hannah Arendt had acted as an anonymous reviewer for the Princeton University Press, she had recommended rejecting the book (See Raul Hilberg, 1996). For a long time Hilberg's work was thought to have shared the controversial views adopted by Hannah Arendt. This did nothing to promote the reception of his book either in the United States, Israel, or Germany.

Hilberg's first supervisor for his doctorate was Franz Neumann (1900–54), who had lost his life in a car accident in 1954. Neumann had warned him of the risks involved in his chosen topic but finally agreed to sponsor it. (*The Politics of Memory*: 66.) In 1948, when Hilberg submitted his master's dissertation to him, Neumann, the author of *Behemoth*, the pioneering study of National Socialism, objected to only one passage in which Hilberg had maintained that "administratively the Germans had relied on the Jews to follow directives (and), that the Jews had cooperated in their own destruction. Neumann did not say that this finding was contradicted by any facts; he did not say that it was under-researched. He said only, 'This is too much to take – cut it out.'" (*The Politics of Memory*: 66. Neumann added: "It's your funeral.") Neumann knew what he was talking about. After his escape from Germany, he had found a bolthole in the Institute of Social Research, which Max Horkheimer had succeeded in transferring from Frankfurt to New York. During the War he had worked on 'analyses of the enemy' for the Office of Strategic Services and had done preparatory work on war crimes trials. Returning to Columbia University, he lectured on political science. Neumann realized that the 'destruction of the European Jews' was a subject that would burst the boundaries separating the academic disciplines and that choosing such a topic would do nothing to advance Hilberg's career.

Neumann himself was a lawyer with sociological training. His *magnum opus*, *Behemoth*, which had appeared in 1942, took decades to gain recognition as a standard work of the social sciences, although from the very outset C. Wright Mills had at once judged it to be "a definitive analysis of the German Reich and a basic contribution to the social sciences"(C. Wright Mills, 1942). But the start of the Cold War spelled the end of research on National Socialism and its crimes. Neumann was personally affected by this – not just in academe but in attitudes in the Western world more generally. Neumann had encouraged Hilberg in his desire to examine the bureaucratic procedures involved in the mass murder of the Jews – an approach he had himself pioneered in his own account of National Socialism. This approach implied a close study of the records from which it would then be possible to reconstruct the course of events. As a trained lawyer, Neumann was familiar with such a procedure. Hilberg still had to learn to do this and to refine his own methods of interpreting the seemingly lifeless sources. Hilberg's initial experience of Nazi perpetrators had come as a young man with the US Army in Germany where he had been sent as a 'scout observer' at the end of the war. Hilberg came from a Jewish family in Austria and had left Vienna as a child in 1939. Having taken out American citizenship, he volunteered for the army. After being demobbed he returned to New York and while studying in Brooklyn College he came across Hans Rosenberg, an émigré German-Jewish historian who drew his attention to the part played by the Prussian civil service in the modernization of German society.

It was but a short step from there to meet up with Neumann who was teaching at Columbia. In 1951, Neumann found Hilberg a temporary job with the War Documentation Project in Alexandria (Virginia), where there were '28 000 linear feet' of records that had been captured from the Nazis. This is where Hilberg learned how to interpret documents. Following Neumann's unexpected death in 1954, he was forced to take up a teaching post in Burlington, Vermont, a job he retained until his retirement in 1991. This post enabled him to complete

his unique project 'The Destruction of the European Jews' for his dissertation and to save up enough money to pay toward the publication of his monumental, 1000-page work. His manuscript's bizarre journey through the publishing landscape of the United States, Germany, and Israel gives us a harsh insight into the public's unwillingness to face up to the scientifically grounded knowledge of crimes committed on such a massive scale that they threaten to overstep the limits of human understanding. This general climate did not change until 1978, when the American TV series 'Holocaust' was broadcast worldwide. In 1979, Hilberg succeeding in publishing *The Diary of Adam Czerniakow* and this was followed in 1982 with the first edition of *The Destruction of the European Jews* in German. An Israeli edition did not appear until 2012, 5 years after Hilberg's death.

The resistance to the results of Hilberg's research in different societies can be explained by their differing ways of coming to terms with the past. The 'Holocaust' TV series in 1978 marked a turning point. Until then the term was a rare word, used mainly by theologians. The realization that Jewish history in Europe could be regarded as one of the roots of immigration to the United States implied that the memory of the Holocaust had to be seen as an integral component of Americans' understanding of their own history. To Hilberg's surprise, the fundamental thesis of the book, that the process of destruction was one gigantic piece of bureaucracy, was scarcely contested initially. (Hilberg, *The Politics of Memory*: 124–125.) However, in the United States, thanks to the Hannah Arendt's positive endorsement, the book found itself caught in the cross fire of the debates about the Jewish Councils (Anson G. Rabinbach, 2000). Hilberg even encountered unexpected difficulties during the actual printing. His cooperation with Yad Vashem fell apart in 1958. Hilberg himself blames this on Yad Vashem's claim to be Israel's 'Remembrance Authority of the Disaster and Heroism,' to quote its official title (Hilberg, *The Politics of Memory*: 109). For his part, Gordon Hubel, the representative of Princeton University Press, fortified by Hannah Arendt's opinion on the manuscript, pointed out to him that there were already a number of 'readily available' books with a broader appeal in existence, and that his book was of interest only to "a very few specialists." (Hilberg, *The Politics of Memory*: 114)

The publication history of Hilberg's great work can only be grasped if we remind ourselves of the lack of clarity in the attitudes of the different nations toward the National Socialists' mass destruction of Jews of Europe. The division of labor in the different university disciplines prevented people from recognizing that this was a legitimate subject of research. Poliakov's *Harvest of Hate* (1951), with a preface by François Mauriac, was more like a contemporary report than an analysis. In 1953, Gerald Reitlinger, the English Orientalist, produced a succinct summation of the process of the so-called Final Solution in general terms. H.G. Adler, in contrast, presented the indifferent German public with an insight into the workings of a single concentration camp, viz. Theresienstadt. Raul Hilberg's magnum opus should be seen as neither a specialist study nor a general survey but as the meticulous empirical reconstruction of the entire process of the destruction of the Jews of Europe, based on the records of the perpetrators. As such it remains unsurpassed to this day, as Christopher Browning, an internationally influential expert on National Socialism, has confirmed (Christopher Browning, 1986).

Hannah Arendt identified a weakness in Hilberg, one that she described in drastic terms in her correspondence with Karl Jaspers, the philosopher of Existentialism. Hilberg "is talking some nonsense about the 'death wish' of the Jews. His book is really excellent, but only because he just reports facts in it. His introductory chapter that deals with general and historical matter wouldn't pass muster in a pigpen" (Lotte Kohler and Hans Sauer, 1992). Such talk of a 'death wish' is not to be found in Hilberg; that is her own invention, but it is true enough that his lengthy introductory chapter does appear to conflict with what he goes on to do in the main part of the book. Hilberg lacks a theoretical framework that might enable us to reflect properly on his empirical findings. The upshot is that the process of annihilation appears as a kind of logical consequence of a millennium and a half of anti-Semitic persecution. On this point Hannah Arendt, as a theorist, feels superior to Raul Hilberg, the political scientist. The resulting controversies point to a more general problem of Holocaust research, namely that the mere act of description can confer rationality on the irrational. (On this point, see Dan Diner, *Beyond the conceivable. Studies on Germany, Nazism, and the Holocaust*, University of California, Berkeley, CA. 2000, Chapter 7: 'Historical understanding and Counterrationality. The Judenrat as Epistemological Vantage [Point],': 130–137; see also the chapter 'Historical Experience. Juxtaposing Perspectives on National Socialism' for its comments on Neumann: 164–167.)

The unprotected nature of the empirical material meant that in the debate between the 'functionalists' and the 'intentionalists' that arose in Germany in the years after 1968 both sides felt that they could appeal to Hilberg as an authority. This conflict intensified in the subsequent 'Historians debate' in Germany in the course of which Hans-Ulrich Wehler was able to expose the lack of theoretical underpinning among contemporary historians (Hans-Ulrich Wehler, 2007). The resulting paradox is that the preface to *The Destruction of the European Jews* suggests an intentionalist approach, while the body of the work points to a structuralist one. The genocide of the Jews cannot be explained simply with reference to Hitler's intentions and the monstrous propensities of the Nazi perpetrators. Thus far Hilberg's study points in the direction of Hannah Arendt's thesis of the 'banality of evil,' but is by no means identical with it. Hilberg's further research, together with his two revised editions of his magnum opus, can also be interpreted as a response to the controversies triggered by his book in the United States, Germany, and Israel.

While the book he wrote in 1976 on *The Role of the German Railroads in the Destruction of the Jews* appears to be based purely on facts, it depends on his trust in empirical reconstruction for its intelligibility. In *Perpetrators, Victims, Bystanders: The Jewish Catastrophe 1933–1945*, a book that appeared in 1992, we can see how the historical record is distorted by the perpetrator/victim dichotomy that also dominates the public discussions of this question. The importance of the indifference of the bystanders as a crucial concept for explaining the behavior of the majority of people remains a closed book to him. His next publication *Sources of Holocaust Research: An Analysis* (2001) reflects this contradictory treatment of his sources. Historical

sources do not speak for themselves; one has to be able to read them. His memoir *The Politics of Memory*: *The Journey of a Holocaust Historian*, which appeared simultaneously in English and German, corrects a number of erroneous accounts. He is right to castigate the intellectual plagiarisms of competitors such as Lucy Dawidowicz and Nora Levin. Nora Levin (1916–89) published her book *The Destruction of European Jewry 1933–1945* in 1968 and in it she mercilessly plunders both Gerald Reitlinger and Hilberg. Lucy Dawidowicz's success (1975) hurt Hilberg even more deeply. Her book was tailored to the tastes of the American public and it enabled her to make the leap in status from scholarly outsider to officially acknowledged expert, a status Hilberg never achieved in the United States. His autobiography *The Politics of Memory: The Journey of a Holocaust Historian* comes very close to an idea formulated by Theodor W. Adorno that was very familiar to Hilberg's mentor Franz Neumann. "When Theodor Adorno condemned those who would write poetry after Auschwitz as barbaric, I had a problem. I am, of course, no poet, but have been a footnote writer. Are footnotes less barbaric?" (Hilberg, *The Politics of Memory*: 138.)

Abstract

The Berlin historian Otto Hintze continues to fascinate those engaged in international historical research. In Germany, there was a particularly noticeable increase of interest in Hintze in the 1960s, in conjunction with an enduring resurgence of social historical schools. The rare combination of detailed investigation through decades of sources on the one hand and the elaborated approach of history's systematic contiguous disciplines on the other brought to light results which are still of great interest in modern research. This is especially true for the comparative approach to political structural history, particularly that of the European states from the height of the Middle Ages to the nineteenth century. From an early stage, Hintze was at pains to incorporate the categories of political science and economics, constitutional law, and sociology into historiographical analysis, thus broadening the scope of the discipline. Despite modernization theory and more recent concepts of the comparative analysis of nation building, Hintze's advocacy of the comparative approach to constitutional and governmental history and the methodological initiatives taken in his works are still of great significance. Indeed, Hintze's approach remains indispensable to the investigation of the processes of state making.

The Berlin historian Otto Hintze continues to fascinate those engaged in international historical research. In Germany, there was a particularly noticeable increase of interest in Hintze in the 1960s, in conjunction with an enduring resurgence of social historical schools. The rare combination of detailed investigation through decades of sources on the one hand and the elaborated approach of history's systematic contiguous disciplines on the other brought to light results which are still of great interest in modern research.

This is especially true for the comparative approach to political structural history, particularly that of the European states from the height of the Middle Ages to the nineteenth century. From an early stage, Hintze was at pains to incorporate the categories of political science and economics, constitutional law, and sociology into historiographical analysis, thus broadening the scope of the discipline. Despite modernization theory and more recent concepts of the comparative analysis of nation building, Hintze's advocacy of the comparative approach to constitutional and governmental history and the methodological initiatives taken in his works are still of great significance. Indeed, Hintze's approach remains indispensable to the investigation of the processes of state making.

Otto Hintze was born in the small Pomeranian town of Pyritz on August 27, 1861, as the son of a middle-ranking civil servant. After studying for two years at the University of Greifswald, Hintze transferred to the Friedrich-Wilhelms-Universität of Berlin in 1880–81. There he studied, for example, under Johann Gustav Droysen, who was still in his final years of life. Hintze completed his doctoral studies in the spring of 1884 with a dissertation on medieval history (*König Wilhelm der Holländer. Ein Beitrag zur Geschichte des deutschen Interregnums*), supervised by the historian Julius von Weizsäcker. Gustav Schmoller, the economic and political scientist who was soon to have a considerable impact on Hintze, was not yet named as one of his academic teachers. Hintze followed his first rather narrow course of study in history with a second in legal and constitutional history (sciences of state). According to the records, this was a formative stage for Hintze, during which Schmoller introduced him to archival research on the Prussian administrative files. Even this, his very first research on unpublished source materials, was carried out in connection with early comparative projects. At the same time, it was Hintze's first practical preparation for his work on the *Acta Borussica*, Gustav Schmoller's editing and research project on Prussian history in the eighteenth century in particular.

Hintze was engaged in this exhaustive project, which was based at the Prussian Academy of Sciences, in various functions over a period of decades. He was initially contracted in 1888 as a research fellow. In this capacity, he acquired an unparalleled command of the published and unpublished source material on the Brandenburg-Prussian state, its regions and provinces, classes and estates, before expanding the scope of his research to include the sixteenth and nineteenth centuries. He completed his postdoctoral thesis, a monograph on the history of the Prussian state economy (*The Prussian silk industry in the 18th century*), in 1895. In 1899 he was appointed professor at the University of Berlin, where – turning down several offers of chairs at other universities – he advanced to the status of full professor from 1900 to 1902–07, and continued to teach until prematurely given emeritus status in 1920. Besides his broad research, which had long since extended beyond the boundaries of Prussia, he owed this distinguished academic career to Gustav Schmoller's excellent contacts in political and administrative circles which is of vital importance in the view of the various animosities among contemporary historians.

The initial focus of Hintze's extensive writings was on constitutional and economic issues of Prussian history, culminating in 1901 in a lengthy monograph on the organization of the Prussian state administrative authorities around 1740. In this volume Hintze analyzed the making of the Prussian state, its development from a territorial state to a 'grand state.' He then reluctantly accepted an official commission to compile a comprehensive survey of the history of Brandenburg-Prussia. Several editions of this work were published in 1915–16, leading to heated (interdenominational) controversies during World War I.

In the course of archival research spanning two decades, Hintze acquired an excellent grasp of the source material, establishing an empirical basis that enabled him, even in further-reaching investigations, to take concrete historical life into consideration, particularly that of more recent centuries. For Hintze, the exploration of Prussian history was never a limited end in itself, but a paradigm for the historical process *per se*. This does not mean to say that he took this historical example as a yardstick by which the development of other states was to be measured, however. By his own account, it was at a early stage of his career – during his studies of legal and constitutional history under Schmoller – that Hintze had identified a much broader area as his future field of research: general constitutional and administrative history, from the comparative perspective. Furthermore, in choosing his Prussian topics of inquiry, he had always considered their usefulness for the 'entirety of my academic plans and studies' (1892).

Long before the World War I, which marked a turning point in Hintze's life, he became engaged in other, broader fields of research. In the course of his dispute with the protagonist of the older German historical school of economics, Wilhelm Roscher, Hintze had presented his conception of a comparative approach to the analysis of world history as early as 1897. In contrast to Roscher, whom he accused of neglecting the fundamental social aspects of state structures, Hintze devised a procedure that integrated both social conditions and the effects of foreign policy and power politics into the analysis of the formation of political structures. Hintze's main concern was to identify the recurring patterns in the development of states by means of a typological and comparative procedure. 'In the social region, there is a tendency towards regulated organic development: the making of states follows this developmental trend to a certain extent, simultaneously regulating it, but is by no means dependent on it alone.' Hintze maintained that the implications of 'power interests' were not to be underestimated, that the establishment of a state was 'at least as dependent on its external position of power as on the preconditions of the particular social structure for domestic governmental activity,' and that the 'external conditions cannot fail to influence social development.' It was this 'political side' of the formation of political structures which Hintze felt was neglected in any typological theory of states which, following the Aristotelian example, merely tried to identify analogous sequences of state systems. Hintze considered the process of state making to be largely dependent on the 'interrelations of the states, on the forces prevailing amongst them, on the rise and fall of the neighbouring states,' i.e., on what Leopold von Ranke had called the 'great world relationships.' (*see* Ranke, Leopold von (1795–1886)) Hintze considered power as a given category, which – like the phenomenon of state rivalries – he did not attempt to deduce in any further detail. For him, the central aim was to define and register 'types conditioned by world history' phenomena observed in groups of states that had maintained close political relations. In this sense, he explained afterwards, he understood state making to be a 'general, regulative principle,' thus implying that he did not intend strict rules to be postulated. It seems that in his early writings, Hintze still assumed a cautious primacy of foreign policy factors in the process of state making, but that – remarkable in the history of science – he turned away from this explanatory model over the course of his further research and analysis.

In a whole series of individual studies, whose scope was gradually to broaden, reaching the dimensions of world history in about 1930, Hintze applied and tested his typologically-based comparative approach. He developed what could be termed a spatial-typological procedure, which makes (European) historical development appear to be that of a bonded unit of regions. Above all, Hintze was keenly interested in the differentiation of a 'core Europe' (with a close genetic and spatial relationship to the Carolingian Empire) and a ring of 'peripheral' countries. He tested this spatial typological and structural historical differentiation at various junctures in his comparative studies of constitutional history – in his works on the history of the European estates, for example. It also becomes apparent in the comparison of continental western and central European absolutism on the one hand and the insular parliamentarianism of England on the other, a differentiation which has admittedly been called into question in recent Anglo-Saxon research. The 'peripheral' states of England, Sweden, Poland, and Hungary were of great interest to Hintze on account of their numerous structural parallels, especially where the 'parliamentarian' tradition was concerned.

Hintze set himself the aim of writing a comprehensive 'general comparative constitutional and administrative history of the modern states, namely the Latin and Germanic peoples,' but the manuscript was no longer published from around 1930 onwards. Central parts of this work were lost after Hintze's death; the fragments that survived are currently being edited by an international team. New sources reveal that Hintze remained keenly interested in the 'individuality' of states and political processes. Of course, the historical legacy of Hintze's work should not be allowed to conceal his innovative potential.

Otto Hintze sought to establish contact with the systematic contiguous disciplines at an early stage of his career, and not merely in reaction to the traumatic upheaval of political cultures subsequent to the 1914/1918 war. On the contrary, he had already begun to lose interest in the Prussian paradigm in the years preceding the war. His openness to the more modern approaches taken by social history, psychology, and sociology became evident as early as 1900, in the mediating statement he made during the so-called Lamprecht dispute about the relationship of 'the individualistic and the collectivist conception of history' (1897). Hintze pointed to the significant contribution made to historiography by Comte and Spencer (*see* Comte, Auguste (1798–1857); Spencer, Herbert (1820–1903)), both of whom he referred to in his lectures. For Hintze, individuality and collectivity constituted the two poles of historical insight, and he maintained that the methods of social psychology afforded great opportunities to go beyond Ranke. Admittedly, Hintze's growing interest in the concepts of sociology characterizes him as an outsider among the historians of his time. Hintze's great 1920s discussions on the theory and philosophy of history, not only with Weber (*see* Weber, Max (1864–1920)), but also with Oppenheimer, Sombart, and Troeltsch, as well as with the jurists Kelsen and Smend, merely marked the culmination of a continuous

development in his work. This is demonstrated, for example, by Hintze's discussion of Sombart's *Modern Capitalism*, in which the Berlin historian also referred to Marx. The extent to which Hintze started from the assumption of a primary, autonomous concept of society is a matter of debate. While he regarded the state as the dominant factor, his later studies and the surviving fragments of manuscripts written prior to 1933 reveal marked changes and a broadening of approach – he now tended towards a concept of society which was not derived from the state alone. For Hintze, social and socio-economic factors began to gain in causal-analytic significance; the same applies to the concept of class, though Hintze never approached Marxist conceptions with anything but a distant interest. It is thus also a matter of contention whether Hintze's typological procedure, along with the principle of 'clear abstraction' (*anschauliche* Abstraction), *ipso facto* neglected the element of dynamics. Hintze's procedure was related (or rather contiguous) to Weber's conception of the ideal type (*Idealtypus*), though always referring to the central question of the individualities of historical developments. It should be noted that Georg Jellinek had made pertinent suggestions for a typological methodology as early as 1900 in his *Allgemeine Staatslehre* (*General Theory of State*), and that Hintze was able to develop these ideas in his search for phenomena of 'relative comparability' (Kocka). In any case, Hintze saw his work as a necessary supplement to both the legacy of Ranke and modern sociology.

Hintze's reception of Weber's writings also predates 1914. Both the strength of his systematic interests and the positioning of methodological boundaries are evident in Hintze's second unpublished magnum opus, which can only be reconstructed to some extent from lecture notes. After 1920, Hintze had intended to publish this work as a 'general theory of state and society on a historical basis,' a continuation of and supplement to his general constitutional history. He had intended to paint a 'typical picture of the modern state in terms of its shared properties and deveopmental trends, its various historical stages and individual forms.' In this 'policy' of Hintze, which he evolved in his middle period, the primacy of the state and of the law was (still) very apparent. 'The state must be considered from the legal, the philosophical, and the historical perspective' – in this order. Social factors were suited and subordinated to this conception. In contrast to his classical studies of comparative constitutional history, in which industry and workers (or the labor movement) played at most a marginal role, Hintze integrated the social developments of the nineteenth century into his 'policy' by means of critical discussion of Marx and Lassalle. In so doing, Hintze was able to identify developments in the middle classes and nonmanual occupations that were to be examined in greater detail by later social historians.

All this makes Hintze still of interest to present-day historians. Of course, not all of his works are relevant today, as a brief glance at his political writings will show. However, his openness to the contributions of the social and political sciences – highly unusual among his contemporaries in the field – and the scope of his view, which finally extended beyond euro-centrism, mean that he remains an important, innovative figure in modern political structural history. Admittedly, the reconstruction of his *oeuvre* is essential to apply his approach in practical research also for further developing his theories, yet this is forever hindered by the fact that central works were never published and can only be substituted and inferred. After 1933 Otto Hintze, who had married the Jewish historian Hedwig Guggenhämer, became a *persona non grata* in Germany. He ordered that his personal papers should be destroyed after his death, which for the most part they were. Hintze died in his Berlin apartment on April 25, 1940, long since isolated from academic life.

Hippocampal Amnesia

Andrew Mayes, School of Psychological Sciences, University of Manchester, Manchester, UK

Abstract

In global organic amnesia, anterograde amnesia in which recall and recognition of recently encountered facts and personal experiences is impaired, co-occurs with retrograde amnesia in which the same kind of memory disturbance is found but for memories that were formed prior to the causative brain lesion. Variants of this syndrome are triggered by lesions to any one of several interconnected brain regions, including the medial temporal lobes (MTL), midline diencephalon, basal forebrain, and retrosplenial cortex. Most amnesia-related research has been done on the MTL, which include the archicortical hippocampus and interconnected neocortical structures, such as the perirhinal cortex (PRC). What these structures do depends on how they process their inputs, what these are, and to where the processed products are sent. The hippocampus receives and mnemonically integrates processed object-related and spatiotemporal context information and has a different structure from the perirhinal and parahippocampal cortices, which receive mainly object and spatial context information respectively. There is evidence that selective hippocampal amnesia disrupts free and cued recall of recently encountered facts and events, but leaves familiarity for recently encountered stimuli intact. However, other hippocampal amnesics have equally impaired recall and familiarity memory and it has been argued that patients with selectively impaired recall have milder amnesia, smaller hippocampal lesions, and would show deficits for *strong* familiarity that diagnoses recognition very accurately. There are several reasons for not accepting this argument. There is no direct evidence for these three claims. Also, PRC lesions disrupt familiarity memory, but leave recall relatively intact, which cannot be explained by the strength confound claim. It seems more likely that global patients have subtle extrahippocampal damage that disrupts functioning in an extended PRC system that mediates stimulus familiarity. Other modeling, lesion and imaging evidence supports the selective recall-disruptive effect of hippocampal lesions and helps interpret it. This work suggests that hippocampus rapidly creates sparse, 'pattern-separated' memory representations of object-spatiotemporal context associations that stress *differences* between its often similar inputs whereas the medial temporal neocortices create pattern-generalized representations that stress *similarities* across their inputs. The pattern-separated representations are good at supporting recall through readily 'pattern-completed' partial cues. They do not support familiarity, which requires pattern-generalized representations, and is achieved through global matching. Whether hippocampal lesions disrupt recall, but not familiarity for premorbid episodes but not facts is underexplored. It is also still disputed to what extent hippocampal amnesics show impaired *perception* and immediate memory for spatiotemporal information.

Introduction

Organic amnesia typically involves two kinds of memory disorder: anterograde amnesia (AA) and retrograde amnesia (RA). AA comprises an impaired ability to recall and recognize recent experiences (episodic memories) and recently encountered facts (semantic memories). In severe amnesia, this deficit becomes apparent as soon as a patient is distracted following a new experience or encounter with a new fact. RA is similar in that it also involves an impaired ability to recall and recognize episodic and semantic information, but this information was put normally into memory prior to the brain damage that caused the memory syndrome. It is often claimed that RA shows a temporal gradient in which recall and recognition of memories formed longer before the triggering brain trauma are less affected and perhaps even normal. However, this claim remains controversial. Also, although AA and RA usually occur together, it remains unresolved to what extent the severity of AA correlates with that of RA (Mayes et al., 1997) and it has even been argued that selective AA or RA is found in some patients.

In one form or another, this syndrome can be caused by damage to any of a variety of brain structures. Thus, it can be caused by damage to different parts of the medial temporal lobes (MTL), the fornix, parts of the midline diencephalon that include the mammillary bodies, the mammillothalamic tract, the anterior thalamic nucleus, parts of the dorsomedial thalamic nucleus as well as other less well specified thalamic nuclei, the retrosplenial cortex, the ventral midbrain nucleus of Guddens, and structures in the basal forebrain, such as the septum and the diagonal band of Meynert. It has also been suggested that damage to some prefrontal regions and even parts of the parietal cortex may cause amnesic-like symptoms. Consistent with the similarity of the memory deficits that damage to each of these structures produces, it has long been acknowledged that they are highly interconnected so as to form, for example, a limbic memory circuit (Delay and Brion, 1969). The structures clearly form one or more functionally connected memory systems that mediate one or more kinds of episodic and semantic memory. Functional magnetic resonance imaging (fMRI) has shown that amnesia-causing lesions to non-MTL structures that leave the MTL structurally intact still disturb the activity and presumably the functional efficiency of the MTL (Snaphaan et al., 2009).

Although causing AA and RA, selective damage to many of these structures has been claimed to leave other cognitive functions and kinds of memory unaffected. Thus, patients with 'pure' amnesia often show good, perhaps unaffected, levels of intelligence and, by inference, attention. Strikingly, semantic memories that were heavily overlearnt prior to brain damage, such as applies to knowledge of word meanings, appear intact. Immediate memory on tests, such as digit span and Corsi

 http://dx.doi.org/10.1016/B978-0-08-097086-8.51039-3

blocks, may be normal as are kinds of longer-term memory that, in contrast to recall and recognition of experiences and facts, do not involve an aware feeling of memory. These preserved procedural/nondeclarative/implicit kinds of memory include skill/habit memory, simple classical conditioning, simple category memory, simple kinds of perceptual memory, and priming (see Spiers et al., 2001). Pure amnesics in whom this pattern of functioning is found are, however, rare and it is much more common to find patients in whom brain damage extends beyond the functional systems that mediate various aspects of aware episodic and semantic memory. In these patients, the partial disruption of brain regions critical for immediate memory, and various aspects of non-aware memory, intelligence and attention, leads to additional memory impairments as well as other cognitive disturbances. Such impure amnesias are often seen in those with closed head injuries and early Alzheimer's disease.

Severity of amnesia is indicated by how far below normal a patient's recall and recognition are in comparison to the mean level of healthy people with the same intelligence. This comparison is necessary because intelligence influences how good memory should be in healthy people by determining richness of memory encoding and flexibility of retrieval, and these processes will vary in pure amnesics because their intelligence also does. It is accepted that severity of amnesia varies from a level hard to distinguish from normal down to AAs that make life feel as if one is constantly waking from a dream, forgetting faster than one can recall what has just happened, and RAs where the past is virtually a blank slate so that one is left with little sense of self. Although severity must reflect the extent to which memory systems have been rendered dysfunctional, its precise determinants remain unresolved. This is partly because severity is confounded with the functional heterogeneity of amnesia, i.e., some lesions disrupt memory differently from other lesions. Nearly all researchers now agree this heterogeneity exists, although they disagree about its nature (e.g., Montaldi and Mayes, 2010; Wixted and Squire, 2011). Disagreement has been especially long-lasting and strong about the kind of functional heterogeneity revealed by damage to certain MTL structures. In particular, it is disputed in what way hippocampal damage (hippocampal amnesia) disrupts memory differently from damage to the perirhinal cortex (PRC) and, to a lesser degree, damage to the parahippocampal cortex (PHC).

This article focuses on the memory and non-memory effects of hippocampal damage (hippocampal amnesia) and how these effects differ from those of PRC and/or PHC damage. A framework for discussion will initially be provided. This framework will consider the inputs of MTL structures, their interconnections and their individual connections with extra-MTL brain structures and how knowledge of this constrains the likely functions of MTL structures and the functional systems of which they form part. As part of this initial discussion, the kinds of differential functions that have been considered for the hippocampus and some other MTL regions will be briefly outlined. The lesion evidence will then be reviewed after which evidence from neuroimaging studies, including fMRI, that are relevant to the interpretation of lesion studies and the possible functions of the hippocampus and other MTL regions will be considered.

Hippocampal and Other MTL Structure Functions: What Are the Constraints and What Are the Functions that Have Been Proposed?

The originating sites of inputs to different MTL structures should constrain *what* information each structure receives and processes whereas each structure's cytoarchitectural structure should constrain *how* it will *process* its inputs. The brain sites to which each MTL structure outputs the products of its processing should also constrain the overall *function* that is performed by the functionally interlinked system of structures of which it forms a part. These constraints are further tightened by the physiological and biochemical characteristics of MTL structures, knowledge of which is being steadily expanded by appropriate experimental and modeling work.

A hierarchical view of the connections to and within the MTL as is shown in **Figure 1**a, has changed little in 20 years (Zola-Morgan et al., 1994; Wixted and Squire, 2011) as Murray and Wise (2012) have pointed out. According to this view, many associative neocortex regions send their inputs to the PRC and PHC and from these structures to entorhinal cortex (ERC) and thence the hippocampus. The hippocampus sends backprojections to many of these associative neocortical sites. Inputs to the PRC and PHC come from distinct neocortical regions. PRC inputs primarily come from temporal cortex (notably from inferior temporal neocortex areas (TE/TEO)), insula and orbitofrontal cortex, which has led to the suggestion that PRC receives and processes nonspatial-object information (objects, faces, and words). In contrast, PHC inputs primarily come from parietal cortex, retrosplenial cortex and different frontal cortex regions, which has led to the suggestion that PHC receives and processes contextual information perhaps with a strong emphasis on spatial information. The strength of these PRC/PHC input differences should not be exaggerated, however, because these structures are directly connected, particularly strongly from PHC to PRC. The hippocampus receives both object-related and contextual information, which it is generally believed to bind/associate together into associative memory representations.

As is shown in **Figure 1**b, the extent to which PRC and PHC form the base of an MTL hierarchy with the hippocampus at its top has recently been criticized. Murray and Wise (2012) have pointed out that the hippocampus and PRC have separate evolutionary origins and are now juxtaposed because the hippocampus, which was originally a medial cortical structure, has been caudally and laterally displaced into the temporal lobe during mammalian evolution. Also, contrary to the strictly hierarchical MTL view, there are direct hippocampal-prefrontal projections and two way hippocampal-prefrontal connections via the retrosplenial cortex as well as other hippocampal-association cortex connections, none of which involve the PRC and PHC (see Aggleton, 2012). The functional implications of these connections remain to be fully identified as do its inputs from subcortical regions, such as the amygdala, basal forebrain (e.g., septum and diagonal band of Broca), ventral tegmentum, raphe nuclei, locus coeruleus, thalamic nuclei (e.g., paratenial nuclei, nucleus reuniens) and supra- and retromammillary regions. The hierarchical conception also

Figure 1 (a) Traditional view of hippocampus as the top structure in an information integration hierarchy with perirhinal and parahippocampal cortices at its base. Entorhinal cortex (ERC), perirhinal cortex (PRC), and parahippocampal cortex (PHC). (b) Modification of traditional hierarchical view, which stresses the greater number of cortical regions that feed into the hippocampus and the importance of prefrontal cortex (PFC) connections.

tends to underemphasize the subcortical projections of the hippocampus via the fornix to medial diencephalic nuclei, such as the mammillary bodies and anterior thalamus, and thence to the retrosplenial cortex, which connects strongly to the hippocampus (Figure 1).

The different evolutionary histories of the hippocampus and PRC/PHC are consistent with the cytoarchitectural differences between these two groups of structures. Whereas PRC and PHC are neocortical, the hippocampal complex (including dentate gyrus, cornu ammonis (CA) fields and subicular, presubicular, and parasubicular cortices) is a very different, somewhat heterogeneous archicortical region with a less layered structure. There are, of course, detailed differences of cytoarchitecture, but, despite this, it seems very likely that the broad kinds of processing engaged in by the PRC and PHC should be very similar to each other, albeit largely applied to different kinds of input. In contrast, the hippocampal processing of its distinct inputs should be very different from that of the PRC and PHC, although hippocampal subregions would also be expected to process somewhat distinct inputs perhaps slightly differently from each other.

The great number of hippocampal, PRC and PHC interconnections that are still being identified (see van Strien et al., 2009) does not preclude that these structures can work separately from each other when engaged in specific kinds of functioning that will involve separate systems of non-MTL structures. Sometimes the structures work together. In rats, evidence indicates that, following even unilateral lesions to the CA fields and dentate gyrus, there was reduced immediate early gene activity in PRC, PHC, and subiculum (Jenkins et al., 2006), although performance on a spatial working memory task was unaffected. But they can also work independently of each other (as again indicated by immediate early gene activity as a marker of neuronal responsivity). Thus, the hippocampus identifies spatial and temporal associative novelty (Jenkins et al., 2004; Amin et al., 2006) without affecting PRC and PHC activity whereas PRC identifies novelty of visually presented objects (see Aggleton and Brown, 2005). Although there may be some differences in MTL organization between rodents and nonhuman primates, let alone humans, if one can extrapolate, this work suggests that hippocampal and PRC lesions may sometimes disrupt the same memory functions and sometimes *selectively* disrupt different memory functions.

There are, therefore, general anatomical reasons for thinking that the hippocampus, PRC, and PHC process somewhat different inputs and that the neocortical MTL structures will transform/process their inputs in broadly different ways from the hippocampal complex, but the nature of these processing differences is unconstrained. However, extensive animal research with long-term potentiation (LTP) and long-term depression (LTD) and single unit recording suggests that the processing should involve LTP- and LTD-like storage of transformed spatiotemporal context inputs in the hippocampus and primarily LTD-like storage of transformed object inputs in the PRC (see Montaldi and Mayes, 2010, for a brief discussion).

Hippocampal Amnesia: The Lesion Evidence

The most famous case of hippocampal amnesia was HM, who developed a dense AA and what appeared to be RA with

a temporal gradient, following the surgical removal in 1953 of a large part of his MTL bilaterally to treat his intractable epilepsy at the age of 27. His case is famous because over the next 50 years he was the most studied amnesic and was the first to incontrovertibly show that MTL damage causes amnesia in humans (Corkin, 2013). However, his brain damage was not selective to the hippocampus because his amygdala and ERC were also extensively damaged. Damage extended into the parahippocampal gyrus, including parts of the PRC, and into the lateral temporal cortex (Corkin et al., 1997). Damage to the hippocampus is also caused by hypoxia that can occur following cardiac arrest, near drowning, attempted hanging, and carbon monoxide poisoning. However, hypoxic damage often and perhaps always extends beyond the hippocampus. Toxins, such as domoic acid, have also been shown occasionally to damage the hippocampus and amygdala relatively selectively and trigger amnesia (Teitelbaum et al., 1990). Autoimmune disorders, associated with several different autoantibodies, including those that act on voltage-gated potassium channel complexes and *N*-methyl-D-aspartate (NMDA) receptor sites, can disrupt the hippocampus and cause amnesia in what is sometimes referred to as limbic encephalitis (Vincent et al., 2010; Zandi et al., 2009). Such encephalitides appear to be more common than was once believed, but once again, they usually tend to affect more than the hippocampus.

Completely selective hippocampal damage (including the CA fields, dentate gyrus and subicular complex), therefore, probably does not exist in humans and even relatively selective damage is rare so that only a few cases have been reported (see Montaldi and Mayes, 2010). With these cases, the extent of confirmatory magnetic resonance imaging (MRI) has been variable so a question always remains about how much undetected dysfunction/damage there is outside the hippocampus and possibly the MTL. This may be the main reason why a dispute has existed for over a decade about how closely hippocampal amnesia resembles global organic amnesia in showing equally impaired recall and recognition of recently encountered stimuli. On the one hand, patients have been reported with AAs in which recall and recognition are equally impaired following hippocampal lesions (for example, Manns and Squire, 1999; see Wixted and Squire, 2011, for a review). On the other hand, patients have been reported in whom recall is more seriously disrupted than item recognition, which sometimes appears to be unimpaired (for example, Vargha-Khadem et al., 1997; Mayes et al., 2002; see Montaldi and Mayes, 2010; Brown et al., 2010, for reviews).

There is a well-established dual process view (for example, Mandler, 1980) that recognition is driven by two kinds of memory: recollection and familiarity. Recollection is a form of recall in which a previously studied stimulus cues the recall of details experienced when it was encountered on a previous occasion (such as what thoughts about the stimulus came to mind). It is, therefore, a form of associative memory in which contextual details are retrieved and help confirm that the stimulus was encountered earlier in a specific situation. In contrast, familiarity involves no recall, but the feeling that the stimulus has been encountered before (whether nonspecifically or in a specific context is still disputed). Both these kinds of memory vary in strength as indicated by confidence in decisions, speed of decision, and accuracy, but recollection is typically stronger. They depend on several processes working together and the relative contribution of recollection and familiarity to performance varies markedly across recognition tasks. Familiarity and recollection can be measured by several methods, each of which depends on hard-to-prove assumptions so there is some dispute about measurement effectiveness, although there are methods for dealing with this that include getting convergent results from more than one method (see Migo et al., 2012). In hippocampal patients with impaired item recognition, when measured, familiarity has been found to be as impaired as recollection (see Wixted and Squire, 2011, for a review). In patients with relatively spared recognition, when measured, familiarity has been found to be completely intact in the face of impaired recollection (see Montaldi and Mayes, 2010, for a review).

There is currently no agreed explanation why these two patterns of memory deficit have been found in patients with apparently fairly selective hippocampal damage. The differences certainly exist and are not an artifact of one pattern being found only with particular tests because sometimes the same tests have been used with both kinds of patients. For example, some 'global' patients are equally impaired on both recall and recognition performance with the Doors and People Battery (Baddeley et al., 1994) whereas 'selective' patients are more impaired on the recall tests from the Battery even though the recognition tests are difficulty matched (see Montaldi and Mayes, 2010 for a discussion). Nor is it likely, given the numbers involved, that 'selective' patients were premorbidly differentially good at familiarity memory or that 'global' patients were premorbidly differentially bad at familiarity memory. Nevertheless, there is a need for researchers to select appropriate tests and measures of familiarity and recollection.

The Doors and People Battery is special because its recognition tests are performed no better by healthy people than are its recall tests. This is not typical because recall performance is usually worse than recognition performance, which is explained in terms of the greater demands often made by recall tests. If this kind of difficulty is honored by the hippocampus and it mediates familiarity as well as recollection, one would expect that more of the structure would be needed to mediate recall efficiently so that small lesions should disrupt recall more than recognition as is found in 'selective' patients. Such an explanation would require that these patients should have smaller lesions and milder recall/recollection impairments. At present, however, there is no evidence that 'global' patients have more impaired recall/recollection or larger hippocampal lesions than 'selective' patients (see Montaldi and Mayes, 2010; Brown et al., 2010). One exception to this is perhaps patients who have 'recovered' from transient global amnesia. It has been shown that patients who are past the acute phase of this disorder often have acute punctate lesions of the hippocampus and a selective impairment of recollection (Jager et al., 2009). These patients may have milder recollection impairments and smaller lesions than typical 'global' patients.

If 'selective' hippocampal amnesia does not result from a simple artifact, it may still not reveal the critical memory role of the hippocampus in healthy people. This is because many

patients show variable degrees of memory recovery in the months following hippocampal damage (e.g., Henke et al., 1999; Holdstock et al., 2008). If future work shows that some patients recover familiarity memory alone whereas others do not, this would suggest the 'selective' patients do not refute the view that the hippocampus is vital for mediating familiarity memory as well as recollection/recall in healthy people. This might occur because 'selective' patients somehow exploit the redundant (degenerate) mediation of familiarity, but are much less able to do this with recollection. In other words, in addition to the primary role of the hippocampus and structures functionally linked to it in mediating familiarity, there are other normally inhibited, structures also capable of mediating familiarity (albeit rather less efficiently) after a period of reorganization following destruction of the hippocampus (which can be total) (see Fanselow, 2010, for a version of this idea). Evidence that 'selective' patients show completely preserved familiarity and the inability to explain why no equivalent redundant mediation of recollection exists make this interesting possibility implausible. An alternative possibility is that compared to 'global' patients, the hippocampus is less damaged in 'selective' patients so that they have more residual hippocampus, which is capable of supporting normal levels of familiarity, but not of recollection, following some recovery time. Both these possibilities imply that the hippocampus of healthy people plays a vital role in familiarity memory so there should be hippocampal activity changes when healthy people experience just familiarity, but this is strongly disputed (see Montaldi and Mayes, 2010; Wixted and Squire, 2011). The lack of evidence that 'selective' patients have less impaired recollection/recall and more hippocampal damage than 'global' patients makes the 'more residual hippocampus' explanation also seem very implausible (see Brown et al., 2010).

However, what needs to be known is how much residual hippocampus is left in individual patients. This means we need to know how much residual *functional* hippocampus is left but evidence about this is currently conflicting. On the one hand, Maguire et al. (2001, 2005) used fMRI to show that successfully recalling factual information failed to activate the remaining 50% of hippocampal gray matter volume of the 'global' patient, VC, but did do so in the 'selective' patient, Jon, who also showed a remaining hippocampal gray matter volume around 50%. These volume estimates were made using structural MRI. On the other hand, Jeneson et al. (2010) have argued that, there is likely to be nearly complete loss of hippocampal neurons when structural MRI measures show that hippocampal volume has reduced a third or more. If correct, this would imply that neither VC nor Jon should have had any residual functional hippocampus. This argument was based on two MRI-scanned patients who subsequently underwent postmortem histological analysis (Rempel-Clower et al., 1996). The conclusion is quite plausible because the residual gray matter, visible on MRI in hippocampal patients, does not necessarily comprise neuronal cell bodies. Nevertheless, it is too early to reject the possibility that the correspondence between structural MRI measures and postmortem histological measures is quite poor and much more research needs to be done in order to improve this correspondence. But, even if Maguire and her colleagues were detecting activations in residual hippocampus with patient Jon, they did this with factual recollection and not with familiarity on its own. Proper support for the residual hippocampus explanation requires that familiarity on its own activates the residual hippocampus in 'selective' but not 'global' patients, but hippocampal activation with familiarity on its own is still disputed even in healthy people with larger hippocampal structures.

Another explanation for the conflicting findings is that 'global' patients have more damage/dysfunction than 'selective' patients in nonhippocampal MTL and/or extra-MTL regions that mediate familiarity memory in the healthy brain. This explanation is plausible because using MRI to identify what may be relatively subtle brain damage and dysfunction is difficult and so MRI studies of hippocampal patients have rarely taken sufficient measures. The explanation also fits better with the observation that inconsistent results have been much less prominent in the animal literature where *selective* hippocampal lesions have usually been found to have little effect on recognition and not to disrupt familiarity at all when it has been measured (e.g., Sauvage et al., 2008; see Brown et al., 2010, for a review). The explanation needs to be systematically investigated by identifying the familiarity-mediating regions in healthy people with fMRI analysis of familiarity and connectivity analyses. Once this is done, differences in gray matter, white matter connections and/or signs of abnormal activity in the familiarity-system can be examined in a large group of hippocampal patients, who have been administered appropriate tests and measures of recollection and familiarity. If the 'global' patients show more damage and/or dysfunction extending into the familiarity-system than the 'selective' patients, especially if this disruption correlates with their familiarity impairments, the validity of the 'selective' effect would be supported.

Although no such study has yet been completed in patients with relatively selective hippocampal lesions, one has been completed with patients who suffered fornix damage following colloid cyst surgery (Tsivilis et al., 2008; Vann et al., 2009). Familiarity and recollection were assessed in a large group of patients using three different measures that gave convergent results. Patients with largely intact fornices and mammillary bodies (the volume of which was measured as a proxy for the fornix because it could be measured more accurately) were compared with very damaged/atrophied fornices/mammillary bodies, carefully matching for any additional brain damage and other neuropsychological measures. The patients with more extensive fornix/mammillary body damage were more impaired on recall/recollection measures, but not on the familiarity measures or on their Doors and People recognition performance. As a single case study of Carlesimo et al. (2007) found a similar pattern of performance in a patient with bilateral stroke damage primarily focused on the mammillothalamic tract, it looks as though this 'extended hippocampal system' may form part of the recollection/recall network.

Wixted and Squire (2011) have argued that both lesion and fMRI studies of recollection and familiarity are subject to a confound. They would not be convinced even by the kind

of large group study described above unless it found that selective hippocampal lesions left familiarity unimpaired when it was strength matched to recollection, which *was* impaired. They believe that lesion studies confound the recollection/familiarity comparison with the strong/weak recognition memory comparison so one cannot know whether a lesion is selectively disrupting recollection or strong recognition memory regardless of whether this is supported by recollection or familiarity. This is because recollection typically gives rise to more accurate (strong) recognition than familiarity, although highly confident and rapid familiarity judgments can lead to very accurate recognition that is matched to recollection (for example, see Montaldi et al., 2006; Montaldi and Mayes, 2010; Kafkas and Montaldi, 2012). Song et al. (2011a) found that their hippocampal patients showed an impaired level of highly confident and accurate familiarity. This, however, indicates nothing surprising because it was already known that these patients' familiarity was impaired, i.e., they were 'global' hippocampal amnesics. What *needs* to be examined is whether 'selective' hippocampal patients show sparing not just for familiarity in general, but also for very accurate familiarity.

The confound argument would, however, have difficulty explaining why hippocampal damage sometimes seems to disrupt recollection selectively whereas PRC (or other MTL neocortex) damage disrupts familiarity selectively. It is hard to explain how fairly weak/inaccurate familiarity needs far less of the resources of the hippocampus than stronger/more accurate recollection but that weak/inaccurate familiarity needs *more* of the resources of the PRC unless these structures have radically different roles in the processing of familiarity and recollection. Double dissociations of this kind have been reported in which impaired recollection was always associated with hippocampal damage and impaired familiarity was associated with PRC damage (e.g., Bowles et al., 2007, 2010), combined MTL neocortical damage (Wolk et al., 2011) or with ERC damage (Yonelinas et al., 2007). In each of these studies, PRC, etc. damage would not have been extensive so it is unclear whether extensive or complete damage would disrupt recollection. However, it is interesting to note that a study by Barbeau et al. (2011) found intact visual recall and impaired visual recognition in a patient with extensive right PRC damage whereas another patient with extensive right hippocampal damage and spared PRC showed the reverse pattern of impairment. Also, research with rats, using the receiver operating characteristics method of calculating recollection and familiarity, has found that, whereas hippocampal lesions only disrupt recollection (Sauvage et al., 2008), substantial and focal lesions of the amygdala (which is strongly connected to PRC) selectively disrupt familiarity (Farovik et al., 2011).

'Global' deficit patients are taken to support the view that the hippocampus supports familiarity as well as recollection for complex combinations of attributes that include spatio-temporal as well as object attributes (see Wixted and Squire, 2011). This view allows that, provided a stimulus involves only one or two attributes, familiarity may be adequately supported by the PRC without the hippocampus. The view seems to imply that functional differences between MTL structures mainly relate to the different attributes that they integrate into memory representations. The selective double dissociation pattern supports a different view, but this is not just about retrieval. Rather, it supports a view according to which PRC (and PHC) receives object attribute inputs, which it rapidly integrates into object memory representations that stress the similarities of the input to other inputs (it pattern 'generalizes'). These representations support familiarity well through a global match procedure in which success depends on the summed similarity of the representation to other representations. In contrast, the hippocampus receives object and spatiotemporal context attribute inputs, which it rapidly integrates into memory representations in which the differences from other, even similar, inputs is emphasized (pattern separation). This is achieved by the sparse encoding of inputs so that relatively few hippocampal neurons code for each input combination so there is relatively little overlap. Such memory representations support pattern completion (recollection/recall) from representation components that act as cues, but they are very poor at supporting global match. Unlike familiarity-related representations, these representations are also flexible as many cues can trigger recall, include all kinds of associative relationships and so have been described as relational (Konkel and Cohen, 2009). So, this view is that, not only do the MTL structures receive different inputs, but the hippocampus encodes and retrieves its inputs in a different way from PRC and PHC. The view is supported by neural network modeling (Norman and O'Reilly, 2003; Norman, 2010) as well as fMRI and other evidence about hippocampal pattern separation (see Yassa and Stark, 2011, for a review).

There is little evidence about whether the pattern of RA differs from that of AA in hippocampal amnesia. It is disputed whether systems consolidation slowly occurs so that memory for events and facts gradually becomes independent of the hippocampus and is unaffected by hippocampal lesions so that RA is temporally graded (see Squire and Bayley, 2007) or whether this is true of factual memories, but not of personal event memories unless they have been transformed into semanticized or gistlike representations (see Winocur and Moscovitch, 2011). According to the latter view, the RA gradient for detailed, untransformed episodic memories is flat. Only one study has so far investigated whether relatively selective hippocampal damage disrupts only recollection for premorbidly acquired fact and personal experience memories. Gilboa et al. (2006) used the receiver operating characteristics procedure for estimating familiarity and recollection in a 51-year old colloid cyst patient with moderately selective hippocampal atrophy. This patient showed preserved fact memory, which probably depended only on his normal familiarity because the procedure suggested that the controls only used familiarity. In contrast, the study showed very impaired recollection for detailed episodic memories and a flat RA gradient. The study leaves unresolved how hippocampal RA affects factual recollection, whether familiarity for episodic details exists and whether it is impaired in hippocampal RA.

The view that hippocampal damage just affects a particular kind of aware associative long-term memory has been

challenged in several ways in the last decade. First, some lesion and fMRI evidence has suggested that the hippocampus is necessary for discriminating between complex spatial scenes, particularly when these are pictured from different perspectives, even when long-term and working memory seem not to be required (see Lee et al., 2012, for a review). This suggests that the hippocampus is necessary for integrating object representations within an allocentric spatial framework, i.e., for perception as well as memory of such scenes. Without such high-level perceptual representations, recall memory may be lost abnormally fast in the minutes following learning as has been reported (see Isaac and Mayes, 1999a,b) and may explain why memory remains normal in amnesics for as long as interfering inputs are minimized (Della Sala, 2010; Dewar et al., 2010). Fast forgetting would be expected because, without distinctive kinds of hippocampally-dependent coding, such as spatial-object coding, the memory representation remaining will be very similar to the representations of many other inputs and suffer excessive interference (see Lee et al., 2012 for the same argument applied to PRC and object memory).

Second and relatedly, hippocampal amnesia disrupts imagination of future or fictitious scenes and events (e.g., Hassabis et al., 2007). Although this may be explicable in terms of a failure of scene *recall memory* and the central role of using such recall constructively in imagination, Mullally et al.'s (2012) finding that hippocampal lesions largely abolish the boundary extension effect suggests that both recall and imagination may depend on the ability to construct spatial scene representations. During encoding, healthy people construct a spatial scene representation that encloses objects/event details. This scene representation extends beyond its real boundaries and produces illusory boundary extension distortions in which the scene is expanded relative to the objects it encloses. The effect applies to haptic as well as visual presentations and suggests that hippocampal amnesics are unable to create the spatial aspects of scenes, something very similar to a perceptual process. The hippocampus may also be critical for temporal sequence memory and perhaps processing (Mayes et al., 2001; Devito and Eichenbaum, 2011), so it may be critical for creating a temporospatial framework for objects. Although it is controversial whether this subserves a high-level integrated form of perception, it is likely that this kind of memory representation underlies associative recall of facts and events. Selective hippocampal damage disrupts recognition and presumably recollection of certain kinds of association (e.g., face–voice associations) where spatiotemporal memory information should not help performance (see Mayes et al., 2007). Nonspatiotemporal components, like faces and voices, may, therefore, be mnemonically linked only in the hippocampus, but this may be automatically done within a spatiotemporal framework even though this is not needed to support recollection performance.

Third, it has been claimed that hippocampal damage disrupts working (immediate) memory for object-location associations (e.g., Hannula et al., 2006; Olson et al., 2006; Pertzov et al., 2013). Although this might be expected if the hippocampus is critical for perception of such associative information, both claims have been disputed by Jeneson and Squire (2012). They do not dispute that deficits can be found at very short delays, but argue that if working memory capacity is exceeded, if rehearsal is hard, or if attention is diverted, then impairments may result because the key distinction is between sub- and supraspan memory. This raises the interesting question of whether associative memory at these short delays depends on the same or different storage mechanisms from longer-term memory.

Fourth, even more controversially, it has been claimed that the hippocampus is critical for associative memory not just with but also without memory awareness (i.e., associative priming) (Henke, 2010; but see Verfaellie et al., 2012). If correct, this would suggest that the hippocampus does the processing to enable certain kinds of associative memories to be stored and later retrieved whether these are linked to conscious feelings of memory (as recollection is) or not, which leaves open whether other connected structures generate conscious memory feelings.

Fifth, Sharon et al. (2011) found that a hippocampal amnesic was able to learn and retain conscious memories of object-word associations normally through an incidental and inferential 'fast mapping' procedure, like that used by infants to learn words rapidly. The authors argued that these memories were accompanied by feelings of memory and lasted for at least a week and were probably mediated by temporal polar regions. Clearly this requires replication with a larger group of hippocampal patients, but, if true, would, unlike Henke's claim, narrow the conditions under which the hippocampus is necessary for forming associative memories.

There is growing evidence that the hippocampus may be functionally heterogeneous. One important distinction is between the anterior and posterior hippocampus (ventral and dorsal in rodents). Whereas posterior hippocampus is more strongly connected to PHC and retrosplenial cortex, anterior hippocampus is more strongly connected to the amygdala and to the PRC and seems to be functionally related more strongly to stress, emotions, such as anxiety and frustration, and social cognition and less to spatial memory than is posterior hippocampus (Fanselow and Dong, 2010; Maguire et al., 2000; Ranganath and Ritchey, 2012). The extent to which these differences are reflected in anterior and posterior hippocampal lesions in humans will be hard to investigate with selectively damaged patients.

Imaging Work that Is Relevant for Interpreting Hippocampal Amnesia

Research with fMRI has investigated whether encoding that leads to recollection or familiarity alone, or the occurrence of recollection or familiarity alone at test, has generally found that recollection activates the hippocampus whereas familiarity does not whereas familiarity correlates with reduced PRC activity relative to novelty (Ranganath et al., 2004; Kafkas and Montaldi, 2012; Montaldi et al., 2006; see Montaldi and Mayes, 2010, for a review). However, Wixted and Squire (2011) have argued that the blood oxygen level dependent (BOLD) response/recognition memory strength/accuracy function may be different for the hippocampus and PRC and that familiarity of similar accuracy to recollection would activate the hippocampus. In two studies, rating

recognition confidence and using the remember/know procedure for measuring word recollection and familiarity, they showed that encoding that produced strong familiarity, and strong familiarity at test, activated the hippocampus as much as recollection (Song et al., 2011b; Smith et al., 2011). However, Montaldi et al. (2006) and Kafkas and Montaldi (2012) have also matched strong familiarity with recollection for accuracy and found that recollection activated the hippocampus more and that familiarity did not activate the hippocampus as a function of confidence, reaction time, and accuracy. Their memory stimuli were everyday scene and object pictures respectively so two interpretations of these conflicting findings are possible.

The hippocampus may mediate familiarity as well as recollection for concrete word stimuli, but not for everyday scenes (comprising objects in a spatial context) and objects. Alternatively, the remember/know procedure may be almost impossible to follow for words because, unlike with scene and object pictures, when people reencode studied words at test they fail to identify recalled word–meaning related information as recollected and wrongly report familiarity. Furthermore, familiarity reports get more confident because unidentified recollections get richer and more detailed. Other evidence supports this interpretation. Thus, Qin et al. (2011) found that hippocampal activity increased as more information/detail was reported, but it did not increase as subjective confidence (and probably accuracy) increased provided amount recollected remained constant. In fMRI studies that examine word familiarity effects, the amount of information found familiar should always be the same so, if familiarity is like recollection of fixed amounts of information, one would expect no increase in hippocampal activity as confidence/accuracy increases. It seems more likely that the hippocampus is not involved in studied word familiarity, but activates more as amount recalled in unidentified recollection increases. However, this remains to be shown.

This interpretation is also supported by two sets of imaging studies. The first set of studies examined five pharmacoresistant epileptic patients who had intracranial EEG (iEEG) electrodes placed in their hippocampus and PRC. In the first study (Staresina et al., 2013), which used recordings from the hemisphere with no seizure-onset zone, the patients encoded words paired with one of two sources (colors or scenes) and were then given a recognition and source memory test for each studied word. The size of the peak iEEG response for correct rejections of unstudied words, recognition without source memory of studied words (arguably mainly familiarity), and recognition with source memory (recollection) was measured. The *relative* ordering of this peak response differed between hippocampus and PRC. In the hippocampus, recollection > familiarity = correct rejection whereas in PRC, correct rejection > recollection > familiarity. Even if the two regions show different memory strength/BOLD response functions, this indicates the presence of two memory signals according to the very strict nonmonotonic requirements of state-trace theory (Newell and Dunn, 2008). Given all available evidence, these two signals are probably familiarity and recollection. In the second study (Staresina et al., 2012), both recording methods used (fMRI and iEEG) showed that, in the hippocampus, an early recollection effect was followed by a late *postdecision* item novelty (correct rejection) effect whereas, in PRC, an early novelty effect was followed by a prolonged recollection effect. This temporal pattern suggests that a rapid PRC item familiarity signal triggers the hippocampus to recollect associated source information, which then perhaps activates PRC representations. Although this interpretation does not fit with the rat immediate early gene data described earlier, it is compatible with the increased functional connectivity of hippocampus and PRC that was found. No support is given for the idea that the hippocampus mediates word familiarity.

In the second set of studies, fMRI data were analyzed with both univariate and multivariate pattern analyses. In the first study (Liang et al., 2013) PRC novelty responses were maximal for faces whereas PHC novelty responses were maximal for scenes. Although these results fit with other findings indicating that object stimuli (like faces) are processed more anteriorly (PRC) whereas visuospatial scene stimuli are processed more posteriorly (PHC), multivariate analyses found that both PHC and PRC showed distinctive coding activity patterns for 'nonpreferred' stimuli that comprised visual and spoken words and sounds as well as faces and scenes. So, *both* these MTL neocortical areas code distinctively for object-related and more visuospatial scene-related information, which the authors argued probably depended on meaning-related differences between stimulus classes. In contrast, multivariate analysis showed that anterior hippocampus did not discriminate between stimulus classes whereas posterior hippocampus discriminated scenes more distinctively than other stimulus classes: these findings fit with functional anterior/posterior hippocampal differences and suggest that anterior hippocampus codes its inputs in a more domain general or 'abstract' way. In the second study (LaRocque et al., 2013), PHC, PRC, and hippocampal patterns of encoding activity that led to subsequent recognition of multiple stimulus categories, including faces, bodies, objects, and scenes, were examined using multivariate analyses. In PHC and PRC, the neural encoding pattern *similarity* of a stimulus to that of all other encoded stimuli was found to predict subsequent recognition whereas, in the hippocampus, subsequent recognition was better for stimuli that showed more pattern distinctiveness (i.e., dissimilarity of the hippocampal neural coding pattern) from other studied stimuli (i.e., better pattern-separated stimulus representations). These studies, therefore, suggest that the inputs of these MTL structures are not as distinct as is often assumed, but that PHC and PRC *code* their inputs very differently from the way the hippocampus codes its. Furthermore, whereas the hippocampus processes its inputs to produce pattern-separated representations that support recollection (pattern completion), the PHC and PRC code their inputs to create similarity-enhancing representations that support recognition through global similarity matching (familiarity).

Conclusion

Although some of the lesion and imaging data appear conflicting and cannot yet be fully explained, a description of what

happens in hippocampal amnesia can be tentatively made. Following selective damage, the hippocampus is no longer able to create flexible, integrated representations of its object-related and scene inputs within a spatiotemporal framework. In particular, it can no longer rapidly create sparse, pattern-separated associative memory representations of all kinds within this framework and later reactivate these from partial cues through pattern completion (recollection). There is no convincing lesion evidence that it plays any role in familiarity. Furthermore, the lesion evidence is supported by fMRI evidence, which indicates that it *does not create* memory representations that enhance similarity with other inputs so it cannot support global matching and probably familiarity. Instead, this familiarity-related processing is done by PRC and PHC. It remains unclear whether hippocampal damage disrupts high-level spatial scene perception, subthreshold immediate object-location memory (although it disrupts such associations at very short delays), and novel associative priming. It is also unclear whether, under certain conditions, arbitrary associations can be rapidly encoded and normally retained as aware, flexible recallable memories. Hippocampal damage impairs rapidly acquired semantic as well episodic memories whenever these involve the recall of associations. Finally, hippocampal damage probably causes RA for facts and events that were not overlearnt premorbidly. However, it remains unclear whether recall deficits for these memories reduce with memory age or whether impairment of detailed episodic recall remains constant as memories age.

Hippocampus and Related Structures

Menno P Witter, Norwegian University of Science and Technology NTNU, Trondheim, Norway

Abstract

The hippocampus is part of the cortex of the forebrain in mammals and is closely linked to a restricted number of related cortical areas that are here collectively referred to as the parahippocampal region. This collection of cortical regions, which in humans is located in the medial portion of the temporal lobe, is critically involved in learning and memory processes, in particular in episodic memory. This article aims to summarize the connectional organization of the hippocampal and parahippocampal domains, largely within the context of their relevance for episodic memory.

What Is the Hippocampus and What Are Related Structures?

The hippocampus is a macroscopically defined cortical structure that is present in the brains of all mammals. In all mammalian species the appearance of the hippocampus is alike in that it is an enrolled continuation of the most medial rim of the cortical surface of the hemisphere. The cortices directly adjacent to the hippocampus, which collectively are referred to as the para-(next-to) hippocampal region, are considered as the related structures. The particular arrangement of these different cortical structures can be easily appreciated in sections taken perpendicular to the long axis of the hippocampus (Figure 1).

The hippocampus and the parahippocampal region of different species are differently positioned in the brain, such that in species with a clearly developed temporal lobe, the position of the hippocampus is more ventrally and anteriorly (humans and monkeys) compared to the situation in for example the rat, where the hippocampus looks more like a c-shaped structure positioned in the posterior third of the hemisphere, such that its dorsal one-third has a marked spatial relation with the posterior half of the corpus callosum. However, these differences in position do not alter the major characteristics and the topological relations between the hippocampus and the parahippocampal structures (see below). Nor does it influence the fact that the most anterior/ventral portion of the hippocampus has a close spatial relationship with the amygdala in all mammals.

General Features of the Hippocampus–Parahippocampal Region and Species Differences

The hippocampus is a three-layered cortical structure comprising three major subdivisions, which can be easily recognized in all species (Figure 1). The first field, the dentate gyrus, is a c- or v-shaped structure, which is characterized by a densely packed cell layer, mainly consisting of granular cells; i.e., cells with a round soma, and a prominent apical dendritic tuft and less developed or almost absent basal dendrites. Enclosed in this c-shaped cortical blade is a polymorphic cell group generally referred to as the hilus of the dentate gyrus. The second subfield is the Ammon's Horn or Cornu Ammonis, generally abbreviated as CA-field. The CA-field has been subdivided into CA1, CA2, and CA3. Some authors have opted to differentiate a CA4 area, which is spatially close to the dentate gyrus. Since this is an ill-defined area, this practice will not be followed here. Likewise, no further subdivisions in CA3 and CA1 will be made. The third subdivision of the hippocampus is the subiculum. Note that according to some authors a prosubiculum can be differentiated from the subiculum proper. Also, readers may find texts in which reference is made to the subicular complex, consisting of (pro)subiculum, presubiculum, and parasubiculum. Based on connectional arguments, it is preferred to consider the prosubiculum as part of the subiculum that partially overlaps spatially with the neighboring CA1, while the presubiculum and parasubiculum are functionally different from the subiculum and in this account they are considered as part of the parahippocampal region (Witter, 2010; Witter and Amaral, 2004).

The parahippocampal region, in contrast to the hippocampus, comprises cortical regions that have more than three layers, generally five or six. In all species, the parahippocampal region comprises five main domains, the pre- and parasubiculum, the perirhinal and entorhinal cortices, and a fifth area which in primates is commonly referred to as the parahippocampal cortex. In nonprimates, the most likely homolog for the latter area is the so-called postrhinal cortex (Burwell et al., 1995; Witter et al., 1989). The respective names of some of the areas that make up the parahippocampal region refer to the rhinal sulcus, which can be distinguished in all mammals. However, its particular features differ quite a bit between species. Whereas in rodents it is a distinguishable fissure that runs along the anteroposterior extent of the hemisphere, in humans it is only present in about half of the population, as a shallow and short indentation in the most medial-anterior temporal lobe.

A remark is appropriate concerning the question whether nonmammalian species have a hippocampus and related structures. In reptiles, cortical areas have been described which resemble, both in terms of cell types as well as connectivity, the mammalian dentate gyrus and Ammon's Horn. Part of the olfactory related cortex of reptiles may be considered homologous to the mammalian parahippocampal region (ten Donkelaar, 1997). There is evidence that lesions of these structures in reptiles interfere with learning. With respect to birds, there is convincing evidence that a particular region in the forebrain, homolog to the reptilian cortex, is functionally important for spatial memory. This region is generally referred to as the hippocampus, and although structurally it looks quite different from the mammalian hippocampus, connectionally it is quite similar. Currently, there is no agreement about the

Figure 1 Three sections of the hippocampus and related parahippocampal structures cut perpendicular to the long axis of the hippocampus of the rat (upper left), the monkey (upper right), and the human (lower panel; modified after Scharfman et al., 2000; with permission of The New York Academy of Sciences).

detailed homology with the mammalian hippocampus and the subdivisions therein (Clayton, 1998; Treves et al., 2008). Finally, even in bony fish, a functionally and structurally comparable area has been described located in the most lateral wall of the telencephalic cortical sheet (Rodriguez et al., 2002).

Wiring of the Hippocampus and Parahippocampal Region

Local Circuits

The subdivisions of the hippocampus and the parahippocampus were originally described based on differences in overall features of cell types, the size and staining properties of the neuronal somata and other striking architectural differences. By now it is well established that the most commonly used divisions, as described above, also differ remarkably with respect to local wiring between their excitatory principal cells. There are additional differences in the organization of inhibitory networks that will not be described in detail here. The dentate gyrus (DG) is characterized by a network of granular cells that project massively to CA3 by way of the so-called mossy fiber pathway. These efferent axons also provide a strong collateral local input to the mossy cells in the polymorph layer or hilus, which in turn project back to the granular cells. The network in CA3 features a strong auto-associative network

through which CA3 pyramidal cells provide a major input onto themselves, which is a unique feature among hippocampal and parahippocampal areas. Pyramidal cells further project to CA2 and CA1 through the Schaffer collaterals and send an output to the septal complex (Witter, 2010). The local network in CA2 is yet poorly explored but recent findings consistently point out that the properties of the individual neurons and the network are strikingly different from what has been reported for CA3 and CA1. CA2 neurons may inhibit CA3 and CA1 in a feedback and feedforward manner, respectively (Jones and McHugh, 2011). The principal cells in CA1 are monosynaptically connected and electrically coupled to each other. They are further connected through a complex series of interneurons. The latter feature is not unique to CA1 but the CA1 has been studied in most detail (Chamberland and Topolnik, 2012). The CA1 neurons project to the subiculum, as well as to a number of cortical and subcortical domains. The organization of the subiculum is yet poorly understood but it may share neuronal properties with CA1, and no elaborate associative network has been described (Kim and Spruston, 2012). Together with CA1 it originates most of the hippocampal output (Witter and Amaral, 2004).

The parahippocampal domains are all multilayered and for most of them our knowledge in the intrinsic organization is still rather sparse. While in entorhinal cortex differences between layers with respect to local networks have been reported, published data on intralaminar connectivity are restricted to known connections from layer V to layers II and III and vice versa. Such interconnectivity between deep and superficial layers seem to be less obvious on pre- and parasubiculum. The entorhinal cortex is subdivided into the lateral and medial entorhinal cortex that differ with respect to types of inputs (Figure 2; Canto et al., 2008). The lateral subdivision receives a characteristic input from the perirhinal cortex, which is mediated through an overall inhibitory network of connections (de Curtis and Pare, 2004). In contrast, the medial entorhinal cortex is characterized by inputs from the preparasubiculum as well as from postrhinal and retrosplenial cortices, both of which are largely mediated by way of excitatory networks, although the inputs from the presubiculum do include a relatively well-developed inhibitory component. There is recent evidence that one of the main principal cell types in layer II, the stellate cells in respectively the lateral and medial entorhinal cortex, are different form each other with respect to electrophysiological properties (Canto and Witter, 2012).

Cortico-parahippocampal–hippocampal Circuits

Most detailed information about the connectivity of the system comes from anatomical tracing studies in the rat, although for an ever-increasing number of pathways relevant detailed information is available for the monkey (Suzuki and Amaral, 2004), the mouse (Witter, 2010), as well as a host of other species, including cats, guinea pigs, and bats (Witter et al., 1989). The picture that emerges from all these studies is that this connectivity is rather well conserved, such that a general, nonspecies specific, description may suffice. The hippocampus has two major pathways through which it is connected to the rest of the brain. The first pathway makes

Figure 2 Summary diagram of the connectivity of the hippocampus and parahippocampus. Indicated are the two major communication pathways of the hippocampus by way of the parahippocampus (bottom part of the figure) and the fornix (top part of the figure). Within the parahippocampal–hippocampal network the lateral (black) and medial (gray) parallel pathways are indicated, as well as how these pathways distribute to different components of the hippocampus (converging onto DG and CA3 – dashed lines; targetting different neurons in CA1 and subiculum, which maintain this input selectivity in their interconnectivity – solid black and gray lines).

use of the so-called cortico-parahippocampal–hippocampal circuit, and the second is formed by the fornix (Figure 2).

A striking feature of the cortico-parahippocampal–hippocampal circuit is that the hippocampus does not have direct connections with the majority of the functionally different cortical regions. In contrast, this communication is mediated by way of the parahippocampal region. Of this region, the perirhinal and postrhinal/parahippocampal cortices maintain the highest number of corticocortical connections, including connections with all major sensory realms, such as visual, auditory, somatosensory, and gustatory ones. Also, massive connections exist with the other two major higher-order association domains, the parietal and prefrontal cortices, but connections with the motor cortex are less prevalent. The perirhinal and postrhinal/parahippocampal cortices, in turn, provide a major input to the superficial layers II and III of the entorhinal cortex, which are further reached by inputs from olfactory structures, the amygdala, and from the remaining two components of the parahippocampal region; i.e., the pre- and parasubiculum. Neurons in entorhinal layers II and III, which are the recipients of this wide variety of inputs, give rise to the major cortical input to the hippocampus, the so-called perforant pathway. This name is derived from the traditional descriptions by Ramon Y Cajal (1911) who noted that fibers from the entorhinal cortex perforate the underlying white matter and the cortical lamina of the subiculum, to enter the hippocampus. The perforant pathway projection harbors two different systems. Entorhinal layer II cells distribute their axons to the dentate

gyrus and CA3, whereas layer III cells send their axons to CA1 and the subiculum. In addition to this intriguing difference in target specificity, the terminal distributions of these two components of the perforant pathway are entirely different. Layer II cells give rise to a widespread projection to distributing throughout the transverse axis of the field, likely targeting most of not all of the principal neurons in DG and CA3. In contrast, axons of layer III cells only target restricted groups of the available neurons in CA1 and the subiculum (see below for functional relevance; see also Figure 2). Hippocampal output from CA1 and subiculum is distributed to a large extent by way of projections back to the entorhinal cortex (van Strien et al., 2009), from where ongoing output projections originate to a host of cortical and subcortical structures, including projections to perirhinal and parahippocampal/postrhinal cortices, prefrontal areas, amygdala, ventral striatum, and midline thalamus. Additional outputs reach other cortical areas either by way of the white matter tract underlying the entorhinal cortex and subiculum (angular bundle) or by way of the fornix (Figure 2; see Section The Fornix)

Within the cortico-parahippocampal–hippocampal system at least two parallel pathways have been described, mediated by way of the two main entorhinal subdivisions. One of the pathways carries inputs from the perirhinal cortex and lateral entorhinal cortex into and away from the hippocampus, whereas the second mediates transfer of information from and to the parahippocampal/postrhinal cortex and medial entorhinal cortex (Ranganath and Ritchey, 2012). In view of the anatomical organization of the perforant pathway outlined above, it is likely that in the hippocampus these two pathways converge at the level of the dentate gyrus and CA3, whereas they are kept more or less separate at the level of CA1 and the subiculum (van Strien et al., 2009). The position of the pre- and parasubiculum in the network is still poorly understood. They are almost exclusively reciprocally connected to the medial entorhinal cortex and the anterior nucleus of the thalamus, likely mediating the main connectivity with the vestibular-based head directional input system (Taube, 2007).

The Fornix

The fornix is a major fiber bundle, which connects the hippocampus to the hypothalamus, in particular to the mammillary bodies (Witter and Amaral, 2004). On its way, the fornix also issues fibers to the septal complex, the ventral striatum, and the amygdala. The fornix is not a pure output pathway since projections from the septal complex to the hippocampus (see section Functions of Hippocampus–Fornix Connectivity) and in part to the entorhinal cortex travel by way of the fornix. In addition, the commissural connections between the left and right hippocampi, and CA1/subicular projections to prefrontal cortex also partially travel by way of the fornix. The hippocampal projection to the mammillary bodies is part of the traditionally described limbic or Papez circuit, which includes the mammillo-thalamic tract connecting the mammillary bodies with the anterior complex of the thalamus, which in turn projects to large portions of the limbic cortex, including anterior- and posterior-cingulate cortex, and pre- and parasubiculum. All these structures, in turn, provide input to the hippocampus, either directly or indirectly by way of the entorhinal cortex (Sugar et al., 2011; Vann et al., 2009).

The Hippocampus Is Not a Homogeneous Structure

When one looks at the overall anatomical organization of the parahippocampal–hippocampal system, it appears that the hippocampus is rather homogeneous along its long axis. However, differences in numbers of neurons between the dorsal/posterior and ventral/anterior hippocampus have been reported, indicative for differences in the overall neuronal network (Witter, 2010). Moreover, in the rat and in the monkey, it has been established that the dorsal/posterior portion of the hippocampus receives its major cortical input from the more sensory-related or exteroceptive lateral and caudal portions of the entorhinal cortex, whereas the ventral/anterior hippocampus receives inputs from more medial parts of the entorhinal cortex, which most likely convey information that reflects the interoceptive status of the individual. In addition, direct reciprocal connections with the amygdala are limited to the ventral/anterior and intermediate levels of the hippocampus and are absent for the dorsal/posterior portion of the hippocampus (Witter et al., 1989). Behavioral data in support of this notion are the findings that in rats the dorsal hippocampus is critical for the initial learning and long-term memory of spatial information, whereas the ventral hippocampus is not essential (Moser and Moser, 1998). Recently, brain imaging studies have revealed that in humans also functional differences are present between anterior and posterior halves of the hippocampus; however the precise nature of these differences is still an issue of debate (Ranganath and Ritchey, 2012; Small, 2002).

Functions of the Hippocampus and Parahippocampal Region

Functions of the Cortico-Hippocampal System

Ample clinical and experimental evidence supports the view that the hippocampus and parahippocampal structures are essential for memory processes, although the unique contributions of each of the different subfields are as yet incompletely understood. The results of behavioral studies, in particular, have provided insights into how each of the components of the hippocampal–parahippocampal system contributes to memory processes. Instead of contributing in a unitary way to memory, it appears evident that individual structures make selective contributions. Such studies indicated that the hippocampal formation itself is relevant for processes like pattern separation and pattern completion, both in terms of spatial and nonspatial components and possibly even the timing of the event (Eichenbaum et al., 2012). The hippocampus does not critically contribute to object recognition memory. Instead, it is the laterally positioned component of the parahippocampal region, the perirhinal cortex, which appears to be critically involved in this task (Brown et al., 2010). In contrast, the more posterior portions of the parahippocampal region, the parahippocampal cortex in primates or the postrhinal cortex in nonprimates, may be critically involved in spatial or

topographical memory (Eichenbaum et al., 2012; Ranganath and Ritchey, 2012). Insight in the functional relevance of the entorhinal cortex has increased dramatically over the last decade since the discovery of spatially modulated grid cells in the medial entorhinal cortex (Hafting et al., 2005). Together with place cells in the hippocampus and head direction cells in presubiculum, they form important networks likely serving path integration; i.e., the internal generation of a representation of space (Moser et al., 2008). In the lateral entorhinal cortex, grid cells have not been found, but in contrast cells apparently code for the position and qualitative aspects of objects; i.e., they likely represent space based on external sensory information (Deshmukh and Knierim, 2011).

Functions of Hippocampus–Fornix Connectivity

As indicated above, the fornix provides the hippocampus with another pathway, beside the cortical route, to communicate with a host of subcortical brain structures, including the mammillary bodies (Aggleton et al., 2010). Although the relevance of the fornix with respect to learning and memory has been highly debated, recent evidence clearly indicate that fornix damage does impair certain aspects of learning and memory. It has been proposed that projections of the hippocampus to the mammillary body and to the anterior thalamus are parallel pathways contributing differentially to these processes (Aggleton et al., 2010). This is in line with convincing data from patients with thalamic infarctions pointing to the importance of the connection from the mammillary complex to the anterior complex of the thalamus (Van der Werf et al., 2000).

The fornix also mediates connectivity from the hippocampal–parahippocampal structures to the ventral striatum and the amygdala. In the ventral striatum, interactions may take place between hippocampal, amygdaloid, and prefrontal outputs, leading to the selection of appropriate behavioral strategies; e.g., in learning paradigms (Pennartz et al., 2011). The functional relevance of the reciprocal connections between the amygdala and hippocampus, and for that matter also those between the amygdala and the parahippocampal region is still poorly understood (Pitkanen et al., 2000). It is assumed that amygdala inputs may provide the hippocampal system with a marker for relevance to a particular memory episode.

The connections to and from the septal complex of both the hippocampus and parahippocampal structures use the fornix as well as a number of other white matter pathways. Although much about these interactions has yet to be resolved, it is clear that the normal functioning of the hippocampal–parahippocampal–cortical interactions depend strongly on a functional septal complex. It is in particular the fact that the septal complex supplies the hippocampus and parahippocampal region with most of its cholinergic input, as well as the role of the septal complex in the synchronization of electrical activity, which relates to its functional relevance (Hasselmo, 2006; Pignatelli et al., 2012).

Clinical Relevance

The hippocampal–parahippocampal structures play an established role in learning and memory processes, which is supported by reports concerning pathological changes seen in diseases that are associated with learning and memory disorders such as Alzheimer's disease. However, other neurological–psychiatric disorders are associated with pathological and/or functional alterations in these regions as well (Small et al., 2011). One striking observation is the laminar specificity of the pathology in entorhinal cortex for each of these diseases (Braak and Braak, 1992). In case of Alzheimer's disease, the initial pathology is seen specifically in layer II, in case of epilepsy, the most striking initial pathology is observed in layer III of the medial entorhinal cortex, whereas in case of schizophrenia, the pathology appears to involve a neuronal displacement in layer II.

Hirschman, Albert O. (1915–2012)

Jeremy Adelman, Princeton University, Princeton, NJ, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article surveys the life and work of Albert O. Hirschman. It chronicles the major intellectual influences and his publications from the 1940s to the 1990s. He contributed to the fields of economic development, history of economic thought, methods in social science theory, and democratic theory. His range reflected a varied and complex life history.

Albert O. Hirschman was one of the many Mitteleuropean intellectuals thrust out of the continent by the spread of fascism and the crisis of the interwar years to contribute to the transformation of the global landscape of the social sciences. It has been a convention to stress the ways in which figures as disparate as Karl Polanyi, Hannah Arendt, and Friedrich Hayek exported continental intellectual traditions to new grounds and expanded on the core they had developed in Budapest, Heidelberg, and Vienna.

Hirschman's career and output were different from many of his peers. Through his multistaged life, he kept evolving, folding in elements and traditions he encountered into the ones he carried with him; each step yielded a new way of thinking and a different set of research questions. Hirschman's style of social science, therefore, represented a compound of influences built up over the course of the twentieth century and shaped by European, American, and Latin American debates. His work also spanned from concerns about balance payments and interstate conflicts in Europe, to the microfoundations of economic development in the Third World, to concerns about collective action, to the intellectual history of capitalism, and meditations on language and democracy. It would be hard to imagine an intellectual who could have intervened so originally in so many big debates. That he was able to do so in large measure reflects Hirschman's ever-evolving intellectual style.

Born in Berlin in 1915, Hirschman grew up in the cultural and political heart of the Weimar Republic. Such a cosmopolitan setting, and the spirit of experimentation and tolerance, left their imprints on the young Hirschman. His parents were members of the flourishing assimilated Jewish bourgeoisie; his father Carl was a surgeon, his mother's (Hedwig) parents belonged to the influential Marcuse clan. They sent him to the French Gymnasium, which emphasized classical learning in math and humanities, especially the tradition of German idealism, as well as languages. As a teenager, Hirschman got drawn into the political maelstrom of the waning Weimar years. His sympathies were with the left wing of the Social Democratic Party, which was locked in a battle with Communists and fascists. But it was more than a political contest for Hirschman; it was also an intellectual cause, as Hirschman was captivated by Marxist political economy. His readings convinced him to study economics at the University of Berlin for one fitful semester in the fall of 1932. Given the electoral agitation at the time, there was hardly a moment to study, however.

Hitler's rise to power interrupted Hirschman's fledgling career. At the same time, his father died of cancer in early 1933. This double blow severed Hirschman's ties to Berlin and he fled in April of that year to Paris. One might say that the end of adolescence closed the door on a boy's dream we might associate with the Weimar Republic, but not entirely. A love of Goethe and a dedication to fight for and understand the cosmopolitan values of his deceased republic accompanied Hirschman through his life.

The flight from Berlin was the first of many; intolerance hounded him from country to country. Someone more vulnerable to embitterment might have considered this trademark of life in the modern age, a sign of decline from the exalted ideas of the Enlightenment. Certainly many other Mitteleuropa exiles spread a shadow of doubt and pessimism over the modern condition. The Frankfurt School is perhaps the most renown. While Hirschman would be buffeted about to become a more broadly European intellectual, schooled in Paris (École des Hautes Études Commerciales), London (the London School of Economics), and Trieste (the University of Trieste), he did not give up hope that the specter of fascism spreading across the continent would eventually roll back. Along the way, Hirschman amalgamated Anglo-American empirical political economy, French interests in geography and statistics, and an important strain of Italian political philosophy associated with liberal socialism. He became increasingly doubtful of the old rigidities of his Marxist ancestry without ever fully disavowing it. These were also years of heady political involvement, which saw Hirschman fight in the Spanish Civil War, participate in the Italian underground, join the French army to thwart the onslaught of the Wehrmacht, and operate a subrosa scheme to help refugees escape from Marseilles in late 1940. An important trait for his social science was the strong connection between action and learning; Hirschman did not believe that scholarship was a separate endeavor from social change. But instead of seeking solutions to perfect the world, Hirschman became more and more aware that his cause was to improve it.

Eventually, the Vichy police came close to chasing him down, and so Hirschman fled once more – this time to the United States. As luck would have it, the Rockefeller Foundation offered him a scholarship to study at Berkeley. He lived there for almost 2 years, got married to Sarah Chapiro, and authored his first book, *National Power and the Structure of Foreign Trade* (University of California Press, 1945). That work distilled many of his economic thoughts that had been incubating especially in Italy and France, to understand the economic dimensions of Germany's expansionist urge. In

examining the role that asymmetrical trade relations played in shaping a foreign policy outlook, Hirschman argued that increasing interdependence between countries of unequal resources and endowments in an age of heightened national security predisposed hegemons to expand and resort to coercive measures. The solution to this structural problem was a change of norms and governing systems that drained sovereignty from national states to supranational cooperative arrangements. *National Power* was innovative. It was a precursor to the field of international political economy and would be picked up again in the 1970s as a foundational text; but at the time it appeared, the world's economists were already fixed on solving postwar problems and not concerned with prewar causes. It was soon forgotten. One aspect of his thinking is worth noting: Hirschman was uncompelled by the debates over Keynesian economics even though he was at ground zero when *The General Theory* appeared on the bookstands in London in 1936. He could not get too excited about rival grand theoretical claims about the self-correcting market. His quarry lay elsewhere: how to fathom the underlying roots of Europe's economic turmoil, concerns that would lead him eventually to the instabilities and disequilibrium of the development process more generally.

After serving on the Italian campaign as a member of the Office of Strategic Services, Hirschman returned to the US and settled with his family in Washington DC. He worked for the Federal Reserve Board in the brain trust that advised the policy makers behind the Marshall Plan. These were not uncreative years, but Hirschman grew increasingly frustrated by the combination of bureaucratic infighting and the polarizing climate that had hard line free marketeers sniping away at US lending to European countries that did not make price stability the primary goal. But it was especially the McCarthy purges of the civil service that sealed Hirschman's fate and sent him packing once more. He did not know it, but the FBI had been trailing Hirschman from the day he arrived at Berkeley. In late 1951, facing unemployment and with a wife and two daughters to support, Hirschman desperately sought help from an old friend who was working at the World Bank (known then as the International Bank for Reconstruction and Development). He learned of a venture the bank was sponsoring to pilot one of the first efforts to invest in development in what would soon be called 'the Third World.' The country was Colombia.

Within months, the Hirschman family and their bags arrived in Bogotá. If Hirschman's first flight led to his Europeanization, and his flight from Europe to his Americanization, this flight led to Hirschman's Latin Americanization. With this phase came his reinvention. Yet, some basic traits of his style were becoming clear. He was no orthodox thinker. He defied categorization. And when times were bleak, it was all the more important to think differently about the source of the problem with an eye to potential remedies. But it was the encounter with the challenges of capitalist development and democracy in Latin America that brought his imagination into relief. In Colombia, he worked not in an ivory tower but as a consultant helping tackle everyday problems of investment in irrigation schemes and housing projects. The World Bank had sponsored a development plan, to be coordinated out the Planning Department of the Central Bank of Colombia, to target investments into sectors and industries that were deemed most likely to pull the country out of its cycle of violence and what was generally regarded as 'backwardness.' Hirschman's job was to go around the country assessing candidates for loans according to a master plan. The day-to-day work was exciting, but the plan was not.

Hirschman chafed. The team of foreign 'experts' worked off a scheme that Hirschman saw as increasingly unhelpful. The urge to follow the script of an abstract model left out a couple of key issues, as far as Hirschman was concerned. The technocrats overlooked much of the dynamism of the private sector on the ground. They put too much stock on their aggregate numbers as a compass for investment decisions. And they scorned local learning, feeling that their expertise and being from the outside made their knowledge untainted and 'objective.' This was absurd, to Hirschman. After 2 years, he was tired of the wrangling in the Central Bank and struck out on his own to be an independent economic consultant, doing similar evaluative work for investors, especially Colombia's various credit agencies.

This was Hirschman's first real exposure to field work, and he became an addict. Indeed, his approach to development economics remained deeply empirical as a result, and not just any empirical style worked for him; he preferred the power of the case study, a method increasingly used and criticized in the social sciences. By evaluating housing projects, pulp and paper plants, road works, Hirschman felt that he could close the gap between the analytical tools and the subject of analysis; he preferred smaller scales and partial insights to large, sweeping causal claims. And he preferred to learn from peoples' actions and behavior.

But there was more than a research style at stake. Hirschman also resisted the kind of certainties that sprung from abstract theories, especially in the emerging field of development economics. Whereas early development economics put the accent on Third World peoples as essentially caught in time, backward, simple folk, who needed outside forces to shake them from their traditions and traps, Hirschman was one of the first scholars to apply a style he borrowed from an old associate from his Berkeley and Washington years, Alexander Gerschenkron. This was the belief that not all societies had to follow the same road toward progress, stages, or phases. Development was not of a piece. There was a second feature to his style, and that was the view that on the ground things were going much better than economists tended to believe. This contrasted with the prevailing view that only external forces were autonomous enough from the lockjaw of tradition to provoke change, as well as the conviction that only concerted all-encompassing plans would work because the forces of tradition would undermine any partial effort and spin the country into disequilibrium. Hirschman thought this was not just wrongheaded; it did not square with empirical findings from the field – and in fact had to override them in order to stay plausible. He found the circular reasoning at odds with the real world of development.

These ideas took final shape when he was offered a two-year fellowship at Yale, thanks in part to the interjection of another old associate, Thomas Schelling. At Yale, he was able to convert his insights into his second book, *The Strategy of Economic Development* (Yale University Press, 1958) one of the masterworks in the history of economic thinking. The book would

catapult Hirschman onto a new career path. But behind its prose was more than learning from the development experience on the ground. Hirschman had been reading a generation of Latin American scholarly political economy that influenced him deeply. He was exposed to a group of economists, in particular, who emphasized the role of deep structures that patterned the nature of Latin American capitalism differently than in so-called developed countries; Latin America was not backwards or *un*developed. It was *under*developed because of its capitalism. No scheme contrived from lessons of the 'developed' world would work very well. Moreover, they emphasized the strains and tensions associated with the development process, and not the goal of seamless, frictionless planning. Development was not just about 'catching up' – a basic precept of standard theory from Europe and North America.

The combination of these Latin American influences shaped *The Strategy of Economic Development*, a book that explicitly offered a counternarrative to elaborate stage theories and the preference for balance and integration. Instead, Hirschman accented the role of disequilibria and tension points in the economic process that compelled people to confront problems and make decisions to solve them. Indeed, a key to the book was that what was scarce in the development process was not capital (which had to be imported) but decision-making capacities (which had to be homegrown). Tensions were not to be avoided; they were not the results of bad policy; they were what good policy should be inducing. In this sense, Hirschman advocated a model of unbalanced growth, not balanced growth. A second aspect of this approach was a concept of linkages, specifically the 'backwards' and 'forwards' activities generated around a specific industry, like mining or fishing. The development process should focus not on overarching concerted plans, but spotlighting sectors and industries with greater linkage effects.

The appearance of *The Strategy of Economic Development*, followed by the Cuban Revolution a year later, put Hirschman in big demand. At middle age, he catapulted into the citadels of American higher education, from Yale to Columbia, Harvard, and finally to the Institute for Advanced Study in Princeton. In the meantime, *Strategy* was the first of what would be four volumes about development. Its sequel turned more explicitly to the study of three case studies of development policy. In emphasizing the centrality of policy over planning, Hirschman was trying to draw attention to the role of states in development, states that need not be treated as just as dragging anchors. With the support of the Twentieth Century Fund, he embarked on a study of agrarian reform policy in Colombia, regional development in Brazil, and inflation and stabilization in Chile. Whereas *Strategy* was based on his Colombia experience without detailing it, this work was explicitly empirical and shaped in concert with a pioneering scholar of policy decision-making processes, Charles Lindblom. Each case chronicled the role of social scientists and 'reform-mongering' policy makers willing to take risks and imagine a different social order without collapsing into defeatism. *Journeys Toward Progress: Studies of Economic Policy-Making in Latin America* (The Twentieth Century Fund, 1963) aimed to show that development was happening on the ground in Latin America, that Latin Americans were not bereft of their own abilities, and highlighted the role that ideology played in mobilizing resources. It was a clarion call at a time in which more and more scholars were impressed by the revolutionary alternative posed by the Cuban Revolution.

The third volume was also empirical, but this time the case studies were many. In 1964–65, Hirschman embarked on a worldwide tour at the behest of the Brookings Institution to evaluate World Bank projects in Asia, Africa, southern Europe, and Latin America. Behind the scenes some of the top brass at the World Bank were keen to have an assessment of a decade of Bank lending. *Development Projects Observed* (The Brookings Institution, 1967) was not exactly what they were hoping for. Instead of concrete evaluations of each project and specific lessons that would amount to best practice recommendations, Hirschman's conclusions were almost lyrical. He sought to 'sing the epic' of development by recounting the ways in which projects – as opposed to strategies and policies of the earlier volumes – could yield to a great adventure. Indeed, he wanted economists to be open to the element of surprise and unintended consequences (which, in his recounting, more often tended to be beneficial than bad), or what he called 'side effects' that were not originally baked into the design and implementation of the project. It was hardly an easy lesson to implement, but it was a plea for open-mindedness in decision making and evaluation. The book did sire one of Hirschman's most famous aphorisms – and Hirschman would soon become renowned for them – 'the hiding hand.' Playing on Adam Smith's notion of invisible, anonymous forces guiding the fortunes of producers and consumers, Hirschman gave it a dialectical twist, to argue that the hiding hand is one that deliberately obscures itself so that people may act; that sometimes knowing the full challenge ahead operates to dissuade people from action; that the anticipated costs of a project had to be deliberately hidden in order to summon its creative energies and unleash its potential. In this fashion, even failures could be good news because they might yield positive side effects, and one can learn from them. By this point, Hirschman's attention to the role of psychological factors and the role of behavior in social change was coming to full fruition.

These books capped an empirical trilogy. Along the way, Hirschman penned a series of increasingly conceptual papers that raised basic questions about the methodological and epistemic features of development thinking, which had him addressing ever broader-gauged issues in the social sciences. These were gathered together in an anthology called *Bias for Hope: Essays on Development and Latin America* (Yale University Press, 1971). The title itself bespoke his concern to resist the rising sense of unease even as the development decade drew to a close and offer alternative ways to think about the connections between politics and economics, while he waded into controversies like foreign aid, industrial policy, and tax schemes. One of the consistent messages was the Latin America's economic difficulties did not represent the end of a model of growth, the futility of reformist policy making, or the pointlessness of favoring certain industrial strategies. More important were the methodological essays. One had him coining the term 'possibilism' (which was really borrowed from Kierkegaard) to denote a specific analytic temperament, one that casts light on what appear to be immutable, stubborn, and impervious obstacles to change, to find options ('Introduction:

Political Economics and Possibilism'). With a little imagination, some lateral thinking and daring, alternatives were possible. "Aren't we interested in what is (barely) possible, rather than what is probable?," he asked himself in his notes as he wrote one of these essays. The ethical compass for the possibilist was a notion of freedom defined, as Hirschman put it, as 'the right to a nonprojected future,' the liberty to explore fates that were not predicted or projected by iron laws of social science. A second injunction was for social scientists to stop obsessing over certainty and prediction – which reminded him of Flaubert's injunction against *la rage de vouloir conclure* as sure to lead us to dead ends and foreclosed outcomes. Maybe we should be more humble and more hopeful, he mused. Instead, social scientists should understand complexity of human action and the unpredictability of its effects. Third, he staked his case for the idea of reform in more fulsome terms. In a blistering attack on how economists harped on about the entrenched obstacles to change and the need for new 'paradigms,' Hirschman applauded the effort to change; what was important about Sisyphus's seemingly endless labors was that he tackle them with a smile on his face ('Obstacles to Development: A Classification and a Quasi-Vanishing Act'). This was always a more appealing approach than the mindless overconfidence in the solvability of all problems or its twin, the fatalism that nothing can be changed willfully at all.

Still, it was hard to deny that development was running into disasters. Hirschman had to confront them first hand. When the Biafran Civil War erupted in Nigeria, Hirschman lacerated himself for not having anticipated this side effect in his evaluation of a World Bank-funded railway project a few years earlier. He had sensed ethnic and regional tensions, but he never imagined things could go so awry; here was a failure of imagination. In response to this war, and to the rising agitation against the US escalation of the Vietnam War, the rise of the civil rights movement, the consumer right movement, he wrote a very quick little book that would make him one of the most celebrated social scientists on the planet. When *Exit, Voice, and Loyalty: Responses to Decline in Firms, Organizations, and States* (Harvard University Press, 1970) appeared, it was clear that he had struck a nerve. No book so effectively explained to its readers how and why people responded to the deterioration of the private and public institutions. He mixed together social psychology, consumer behavior theory, and political science to illuminate how people wrestled with rival internal propensities at any given time. Just as the development process was a complex one, Hirschman was now arguing for a complex notion of individual and social behavior – an approach that would poise him in a conflict with a subsequent drive to assert the behavioral primacy of 'the rational actor.' At the time, many people read the book as charting human responses as alternatives to each other, as contradictions. But this was not Hirschman's argument. Rather, what fascinated him was the way in which voice, the 'political' response, and exit, the 'economic' reaction, might even supplement or complement each other. Wielding the exit option, say threatening to use school vouchers, could give more power to the voice of school reformers. Other times, exit had deleterious effects on voice, as in the case of Nigerian railway managers, who's response to shippers leaving price-gouging railway rates was to hire truckers, and along the way to aggravate internecine ethnic rivalries. By the end of the book, Hirschman himself was warning that the practitioners of voice had to keep their craft alive lest people succumb to too much exit. Either way, the very wording exit, voice, and loyalty captivated readers more often than some of the subtleties of the book's content. This was perhaps an instance of the cover inviting premature judgment.

There was a way in which Hirschman's fame in the 1960s was a function of the decade's underlying hopefulness. As the 1970s unfolded, and the mood turned decidedly bleaker, Hirschman found it increasingly difficult to hang on to his optimism. But he did try to understand the turn; indeed disenchantment and disappointment became subjects of his analysis. One of his most famous essays took aim at the way in which economists and political scientists invoked social disparities to account for the discontent. Called 'The Changing Tolerance for Income Inequality in the Course of Economic Development,' *Quarterly Journal of Economics*, 87 (November 1973: pp. 544–565), it drew attention to subjective and perceptive forces in determining whether people deferred to or protested widening gaps. Along the way, he coined another famous term, 'the tunnel effect,' to denote the ways in which peoples' moods could shift from elation to outrage without being objectively worse off – or vice versa.

But he was not blind to the shift around him. It had an important effect on his work. Hirschman made several decisive choices. One was to leave Harvard to become a permanent faculty member at the Institute for Advanced Study in Princeton, where he would join with the anthropologist Clifford Geertz in trying to chart a course of social science that would differ from the mainstream drift of the academic disciplines.

Hirschman's subjects also made two turns. The first was, as he put it, 'to retreat to history.' In the face of a rising 'neoconservative' tide, especially in economic thinking associated with free market ideology and precepts about the futility of collective action, Hirschman went back in time to examine the origins of thinking about capitalism. What he aimed to reveal was a general appreciation that, on the eve of capitalism's triumph, of a more complex sense of the self, one that time narrowed into the 1970s version of *homo economicus*. There was also a more nuanced understanding of the mutual dependence of the state and market – not an intrinsic hostility. What came of this was a luminescent book about the history of thinking about capitalism, *The Passions and the Interests: Political Arguments for Capitalism before Its Triumph* (Princeton University Press, 1977), which insisted that there were alternative ways of thinking about markets and politics, ways that were more humane, more creative – and ultimately more liberating than the schema advanced by critics and defenders of capitalism in the 1970s. This book is generally considered a milestone in the history of economic thought. It also set the stage for a series of essays he would later write in the 1980s that would draw upon the historical arguments to intervene in contemporary debates. These essays argued for a more complex notion of the economy itself, one that would admit multiple rationalities, a sharper connection between politics and economics, and an eloquent defense of the moral responsibilities of social scientists. These essays were gathered together in two important anthologies, *Essays in Trespassing: Economics to Politics and Beyond* (Cambridge University Press, 1981) and *Rival Views of Market Society and Other Recent Essays* (Viking, 1986).

The second response to the malaise of the 1970s was to return to the field of development in Latin America. This was, in some senses, a very odd decision. After all, matters had gotten decidedly worse. Salvador Allende was overthrown in Chile; the Brazilian military turned the screws on civilians; the Mexican miracle was going sour after the massacre of 1968, and the Argentine coup of 1976 gave new meaning to martial brutality. It seemed, moreover, that the old model of industrialization was indeed finally spent. Yet, it was precisely these mounting challenges that compelled him to write essays that questioned whether Latin American economies were 'spent' and whether the authoritarian turn was so 'determined' by the economic crises. He was resolved to shake off heavily structuralist thinking and underlying pessimism in Latin America. What was unique about many of these essays was how they emerged from extended conversation and collaboration with a younger cohort of Latin American social scientists keen to throw off the strong Marxisant leanings but without abandoning the interest in class relations or political economy. These included the Argentine Guillermo O'Donnell and Brazilian Fernando Henrique Cardoso. But just as the retreat to history admitted a historic shift, Hirschman also had to confess that his original field, development economics, had also run aground. His 'Decline and Fall of Development Economics,' a masterpiece of living intellectual history, was perhaps his most pessimistic publication. These essays would also reappear anthologized in *Essays in Trespassing*. The return to Latin America culminated in his last field research project conducted in 1982–83, when Hirschman evaluated several dozen grassroots projects funded by the Inter-American Foundation. Based on extensive interviews across the region, he showed that the poor did organize collectively to pursue common goals, and sometimes transformed their lives as a result – this often in a context of dire economic circumstances in the midst of a debt crisis and dictatorship. His least well-known book, *Getting Ahead Collectively: Grassroots Experiences in Latin America* (Pergamon Press, 1984) was bereft of much theory. But it did anticipate a turn to the study of social movements, bottom-up development, and microfinance.

One might argue that Hirschman then had two tracks – one about development and its macro causes and consequences, and one a concern with microfoundations of behavior in the marketplace and politics. Ambitiously, Hirschman sought to bring these two sides together in a series of lectures delivered at Princeton University in 1979 and later published as *Shifting Involvements: Private Interest and Public Action* (Princeton University Press, 1982). That book took elements of *Exit, Voice and Loyalty*, especially the observation that peoples' responses to circumstances oscillated according to diminishing returns to their consumption, civic, and political habits. It also borrowed from his development thinking about democracy and capitalism. What it argued was that people were both pursuing private and collective aims and would swing in pendular fashion between them depending on their relative rewards, and that political regimes, dictatorships as well as democracies, were shaped by and shaped these strategies. *Shifting Involvements* was possibly Hirschman's most ambitious book even though it was very short 134 pages. It was also most severely reviewed, very often because Hirschman's essayistic style had to gloss over big thorny issues to which social scientists had devoted a great deal of attention. But it did enjoy a better reception in Latin America and in Europe, where social scientists were more anxious to draw out similar connections, even if some of Hirschman's causal connections were not so clear.

There was a seam in Hirschman's narrative style: the delicate equipoise between impassioned observation and critical involvement. Here was knowledge aimed at changing understandings of the world. The readerly experience of a Hirschman book or essay was intended to be one that destabilized the commonsensical and the orthodox. Whether it was the gurus of 'balanced growth' in the 1960s or the Milton Friedmanite zealots of the 1980s, Hirschman's purpose was to challenge closed certainties. Nor did he spare his colleagues on the Left. He was a sympathetic skeptic of the hardened 'dependency' theories or 'structuralist' explanations for the troubles in Latin America. It is often forgotten that in his famous book exposing the wordplay of what we now call 'neoliberal' apostles in *Rhetoric of Reaction: Perversity, Futility, Jeopardy* (Harvard University Press, 1991), one chapter was devoted to progressive forms of intransigence.

That book also brought to fruition many years of thinking about the role of discourse in politics. In a sense, Hirschman was always aware of the power of words and their ties to ideology and perceptions. But as neoconservatives grew increasingly triumphal in the 1980s, Hirschman grew more concerned that they were also closing themselves off from the prospects of being wrong or from learning anew. He was as ever always concern with the prospects for reform and improvement. Hence the laser beam on 'reaction,' which was, he charted in the book, a semantic hostility to the very idea of reform and deliberate improvability. He had seen some of the consequences unfold in Germany. It was this concern about the democratic fabric that compelled him first to write an essay for *The Atlantic Monthly* and then a complete book on the subject. In it, he coined three word games that intransigents play – futility (that all reforms were doomed to fail anyway), jeopardy (that deliberate reforms might undermine improvements), and perversity (that deliberate reforms might make things worse).

As his career drew to a close, Hirschman returned more and more often to Europe. His work was being translated into French and German, his essays circulating widely around the continent, where he was also being showered with honors and awards. Poignantly, he began to return with more frequency to Berlin, and was there through much of the transition in 1989–90, to watch his natal city reunited and democracy restored. In a way, he felt his hopefulness redeemed. The events spawned a series of reflections on the importance of humility and revisiting one's concepts, a principle he called 'self-subversion.' His last major published essay was called 'Social Conflicts as Pillars of Democratic Market Society,' *Political Theory*, 22 (May 1994), pp. 203–218. It warned that, in a reunified post-1989 Germany, citizens should not rush to serve democracy with shared, community values or norms to ease the frictions and tensions of pluralism. Nothing would be more pernicious – and one can almost hear the voice of a century's watching Germans wrestle with the challenge – than to deal with conflict by reaching for national or collective ideals. Just as he had once told development economists

to treat tension and conflict as the requisites of economic change, he was now urging Europeans to see social conflict as a premise for democratic life.

Hirschman was a master at turning familiar phrases and common coinages on their heads precisely to lure his reader into discovering that realities were not as fixed as they seemed. This was one of the reasons why Hirschman was an early trespasser into psychology and was always eager to loosen the constraints of predictive thinking (in mainstream American social science) or heavy structuralism in development thought. Belatedly, he is now being recognized as one of the founders of a more expanded behavioral social science and for this reason the subject of a revival after many years of disdain from disciplinary purists. Many people wondered why Hirschman did not win a Nobel Prize for economics, which *The Economist* noted, in its obituary to him, he richly deserved. The fact is, Hirschman defied the familiar ways in which the academy and its disciplines organized its intellectual fiefdoms. What made him so original was that he emerged from the margins of the university and so was never truly of the university. This freed him to cross boundaries with great abandon. But it also made him very hard to categorize, even though he always considered himself at heart an economist.

EDITOR IN CHIEF BIOGRAPHY

James D. Wright received his bachelor's degree in philosophy from Purdue University in 1969, a master's degree in sociology from the University of Wisconsin in 1970, and his PhD in sociology from Wisconsin in 1973. His first academic appointment was at the University of Massachusetts, Amherst, where he was promoted to Associate Professor in 1976 and to Full Professor in 1979. Most of his 15 years at Massachusetts were spent as Director, Associate Director, or Director of Research in the Social and Demographic Institute.

Wright left Massachusetts for Tulane University in New Orleans in 1988 where he served as the Charles and Leo Favrot Professor of Human Relations in Tulane's Department of Sociology. He also enjoyed a courtesy appointment in the Tulane School of Public Health, Department of Biostatistics and Epidemiology. He left Tulane in 2001 to become the Provost's Distinguished Research Professor of Sociology at the University of Central Florida. In 2003, he was named as the Director of the University's Institute for Social and Behavioral Sciences and in 2013, was designated as a UCF Pegasus Professor, the University's highest faculty honor.

Wright was the Editor in Chief of the scholarly journal *Social Science Research* from 1978 until 2014. His previous editing experience also includes a 20-year stint as editor of the Aldine de Gruyter book series *Social Institutions and Social Change*, two editions of the *Handbook of Survey Research* (Academic Press, 1983; Emerald Publishing, 2010), and service on the editorial boards of numerous journals. He is the author of 21 books and scholarly monographs on topics ranging from homelessness to research methods to NASCAR, and he has published more than 300 journal articles, book chapters, reviews, essays, and polemics. Wright lives with his wife Christine Stewart and their multiple dogs and cats in Winter Springs, Florida, where in his spare time he likes to cook fancy meals for large crowds.

PREFACE TO THE FIRST EDITION

Large and ambitious works such as the present Encyclopedia depend on countless instances of input, cooperation, and contextual support. Therefore, the editors in chief would like to express their gratitude to several institutions and individuals. Our most general thanks go to our respective home institutions, the Center for Advanced Study in the Behavioral Sciences, Stanford, and the Max Planck Institute for Human Development, Berlin. We are certain that without the effective infrastructures of these institutions and the rich collegial networks and intellectual climate they provide, implementing this Encyclopedia in such a short amount of time would not have been possible. In this context, we also need to mention that due to the administrative budgets provided to the editors in chief by the publisher, the financial strains on our home institutions were minimal. Such a situation may be a rarity in the modern world of scientific publishing where publishers often press scholars and institutions into taking on larger and larger shares of the publication enterprise.

Aside from the more than 4000 authors, our deepest thanks goes to the editors of the 39 sections, to whom we delegated many decisions at various stages, who were primarily responsible for developing the lists of articles and authors, and who stood as the main gatekeepers of scientific quality for the entries in their sections. As a group, the section editors displayed remarkable energy, intelligence, and tolerance for the inevitable frustrations of tending large numbers of authors over a long period of time. Because of the brevity of the acknowledgment of the main editorial coproducers here, we alert the reader to the list published as part of the front matter and the description of their extensive work we offer in the Introduction. We would also like to mention that one of our highly esteemed section editors, Franz Weinert, died unexpectedly during the last phases of his editorial work. For people who had the pleasure of knowing Franz Weinert, it comes as no surprise that he completed his editorial duties without ever complaining about the difficult health conditions he was facing. He was a gentleman and a distinguished scholar.

The International Advisors also gave wise counsel on several designated occasions, and a number of these scholars represented on the International Advisory Board took more initiative — always helpful — than we had originally asked. The International Advisory Board was particularly helpful in the process of choosing section editors. Some of its members assisted us ably as we attempted to make the Encyclopedia as international as possible and also in dealing with special problems that are part of a large project with close timelines. Thus, we remember a few occasions where members of the International Advisory Board helped us with their substantive and social competence to deal with matters of editorial disagreements. Because of the overall quality, collaborative spirit, and professional responsibility of our section editors, these events were rare indeed, but dealing with them required masterful and accelerated input. We appreciate the collegiality that members of the Board displayed when called upon in these special circumstances.

In addition, and as described in the Introduction, there was a host of esteemed colleagues who gave us advice on numerous questions such as author and editor selection, organizational matters, topics for entries, content and quality of selected articles, substantive and methodological niches to be covered, as well as last-minute author replacements. The number of such individuals is large indeed, and most likely, significantly larger than the list presented below. There were too many short, but nevertheless significant collaborative encounters that we likely did not deposit into our long-term memory or written documentation. We apologize for such oversights.

In this spirit, we appreciate the advice given in the three planning meetings in Stanford, Uppsala, and Dölln/Berlin by the following scholars: Peter Behrens, Burton Clark, Gordon Clark, Lorraine Daston, Meinolf Dierkes, Jean-Emile Gombert, Torsten Husén, Gérard Jorland, Ali Kazancigil, Wolfgang Klein, Gardner Lindzey, Renate

Mayntz, Andrew Pettigrew, Denis Phillips, Marc Richelle, Ursula M. Staudinger, Piotr Sztompka, Eskil Wadensjö, Björn Wittrock, and Robert Zajonc.

We would like to extend special thanks to Laura Stoker, who pinch-hit for Nelson Polsby (section editor for Political Science) who was unable to attend the meeting of section editors in April 1998; and to Linda Woodhead, Senior Lecturer in Religious Studies, Lancaster University, who assisted David Martin with editorial work at all phases for the section on Religious Studies.

We also acknowledge the help of scholars who advised Smelser and Baltes at the stage of pulling together the entry lists, proposing authors, and occasionally reviewing the content and quality of articles submitted.

Smelser thanks: Jeffrey Banks, Peter Bickel, Edgar Borgatta, Charles Camic, Jennifer Chatman, Jean Cohen, Michael Dear, Pierre Ducrey, Eckart Ehlers, Sylvie Faucheux, Steven Guteman, Frank Furstenberg, Helga Haftendorn, Peter Katzenstein, David Laibson, Stephan Lauritzen, Douglas McAdam, Eleanor Maccoby, Phyllis Mack, Cora Marrett, Douglas Massey, Donald Melnick, Harvey Molotch, Lincoln Moses, James Peacock, Trond Petersen, Andrew Pettigrew, Alejandro Portes, Matilda Riley, István Rév, John Roberts, Dorothy Ross, Rob Sampson, Fritz Scharpf, Melvin Seeman, James Short, Fritz Stern, Carol Swain, Ann Swidler, Ken'ichi Tominaga, Charles Tilly, Wolfgang van den Daele, Sidney Verba, Margaret Weir, Thomas Weisner, and Jennifer Wolch.

Baltes is very grateful to: Nancy Andreasen, Gerhard Arminger, André-Jean Arnaud, Jens Asendorpf, Jan Assmann, Margret Baltes (deceased), Jürgen Baumert, Peter Behrens, Manfred Bierwisch, Niels Birbaumer, Peter Bloßfeld, Walter Borman, Robert F. Boruch, Mark Bouton, Michael Bratmann, David Buss, Shelley Chaiken, Lorraine Daston, Juan Delius, Marvin Dunnette, Georg Elwert, Helmut Fend, Hans Fischer, Peter Frensch, Alexandra M. Freund, Dieter Frey, Jochen Frowein, Gerd Gigerenzer, Snait Gissis, Peter Gollwitzer, Ian G. Gotlib, David Gyori, Heinz Häfner, Helga Haftendorn, Giyoo Hatano, Adrienne Héritier, Theo Herrmann, Otfried Höffe, Ludger Honnefelder, Paul Hoyningen-Huene, James Huang, Günther Kaiser, Heidi Keller, Martina Kessel, Gábor Klaniczay, Wolf-Hagen Krauth, Achim Leschinsky, Karen Li, Shu-Chen Li, Ulman Lindenberger, Elizabeth Loftus, Gerd Lüer, Ingrid Lunt, Hans J. Markowitsch, Laura Martignon, Randolf Menzel, Dietmar Mieth, Susan Mineka, Setsuo Miyazawa, John R. Nesselroade, Claus Offe, Vimla Patel, Meinrad Perrez, Rosa Lynn Pinkus, Robert Plomin, Neville Postlethwaite, Thomas Rentsch, István Rév, Peter Roeder, Richard Rorty, Hubert Rottleuthner, Peter Schäfer, Heinz Schuler, Norbert Schwarz, Richard J. Shavelson, Joan E. Sieber, Burton Singer, Wolf Singer, Edward Smith, Hans Spada, Günter Spur, Rolf Steyer, Michael Stolleis, José Juan Toharia, LeRoy B. Walters, Elke U. Weber, Peter Weingart, and Reiner Wimmer.

There was one more group that played a special role in the editorial review (see also Introduction). Baltes was assisted by a team of colleagues who provided expert input to the section editors and to him during final review: Gregor Bachmann, Alexandra M. Freund, Judith Glück, Wolfgang Klein, Olaf Köller, Shu-Chen Li, Ulman Lindenberger, Ursula M. Staudinger, and Christine Windbichler. Their expertise in helping us to ensure quality is gratefully acknowledged.

The day-to-day organizational work of the editors in chief occurred at their respective research centers — the Center for Advanced Study in the Behavioral Sciences and the Max Planck Institute for Human Development in Berlin. Smelser singles out Julie Schumacher, his main assistant in the project, for her organization of the meeting of section editors, and her superb coordination of the flow of correspondence and manuscripts over several years. She remained firm when the rest of us were faltering, and displayed the greatest efficiency, intelligence, and good cheer. Smelser also relied on periodic help from Leslie Lindzey, Kathleen Much, Jane Kolmodin, and Anne Carpinetti. Michelle Williams of the University of California, Berkeley, served as his main editorial assistant for nearly 2 years, going over all entry manuscripts from the standpoint of readability, and carrying a great part of the cross-referencing work; her judgment was always the best, and Smelser is forever indebted to her.

At the Max Planck Institute for Human Development, and aside from Julia Delius (see below), Baltes expresses his deeply felt thanks to the main secretarial staff in his office (Helga Kaiser, Romy Schlüter, Conor Toomey) who during the preparation of this Encyclopedia took on larger shares of responsibilities for other projects and occasionally helped out when the editorial office was overloaded. More directly involved in the day-to-day operation of the Encyclopedia was Penny Motley, who efficiently functioned as project secretary during the planning phase. During the main phases of the project, it was Yvonne Bennett who was responsible for secretarial and organizational matters. She deserves much applause for her superb and efficient help in the day-to-day running of the editorial office, making sure that all manuscripts and proofs were processed quickly, and also for assisting with the organization of various meetings. Not least, Baltes thanks the administrative office of the Max Planck Institute, and there especially Nina Körner and Karin Marschlich, for their competent work in managing the project budget, as well as Sabine Norfolk who handled most of the numerous fax

transmissions with ever present smiles and friendliness. Finally, in the Berlin editorial office, thanks are also due to Susannah Goss for her excellent work in translating individual articles into English.

Individual section editors wish to thank the following scholars who gave them substantive advice in their work: Richard Abel, Itty Abraham, John Ambler, Karen Anderson, Mitchell Ash, Alan Baddeley, Boris Baltes, Manfred Bierwisch, Michael Bittman, Sophie Bowlby, John Carson, Shelly Chaiken, Roger Chartier, François Chazel, Stewart Clegg, Carol Colby, Philip Converse, James Curran, Jerry Davis, Natalie Z. Davis, Peter Dear, Juan Delius, Michael Dennis, Josh DeWind, Sherry Diamond, Elsa Dixler, Georg Elwert, Howard Erlanger, Drew Faust, Malcolm Feeley, Nancy Folbre, Michael Frese, Angela Friederici, Lawrence Friedman, Bryant Garth; Victor Ginsburgh; Marcial Godoy, Frances Goldscheider, Calvin Goldscheider, John H. Goldthorpe, Reginald Golledge, William Graziano, Stephen Gudeman, Mauro Guillen, Doug Guthrie, John Hagan, Eric Hershberg, Steve Heydemann, Stephen Hilgartner, Judith Howard, William Howell, Jill Jaeger, Bob Kagan, Joe Karaganis, Roger E. Kasperson, Ronald Kassimir, Robert W. Kates, Wolfgang Klein, Hans-Dieter Klingemann, Bert Kritzer, Kay Levine, Steven Lukes, Michael Lynch, Akin Mabogunje, Stuart Macaulay, Donald MacKenzie, David Magnusson, Michael McCann, Sally Merry, Peter Meusburger, Sieglinde Modell, John Monahan, Kevin Moore, Gerda Neyer, Hiroyuki Ninomiya, Jodi O'Brien, Eva Oesterberg, Mark Osiel, James L. Peacock, Susan Phillips, Trevor Pinch, Wolfgang Prinz, Sheri Ranis, Harry Reis, Estevao C. de Rezende Martins, Marc Richelle, Leila Rupp, Gigi Santow, Austin Sarat, Simon Schaffer, Linda Scott, Tim Shallice, Seteney Shami, Ronen Shamir, Susan Silbey, Wolf Singer, Sheila Slaughter, Gerhard Strube, Ursula M. Staudinger, J. Stengers, Stephen M. Stigler, Michael Stolleis, Mark Suchman, Denis Szabo, Verta Taylor, Ashley Timmer, David Trubek, Leslie Ungerleider, Don Van Arsdol, Jakob Vogel, Rita Vörg, Judy Wajcman, Mary Wegner, Wlodzimierz Wesolowski, Steve Wheatley, Björn Wittrock, and Vincent Wright (deceased).

Section editors also thanked the following persons for their research assistance: Pamela Anderson, Susan Augir, Anja Berkes, Chantale Bousquet, Aida Bilalbegović, John Clark, Susanne Dengler, Kathrine Derbyshire, Annie Devinant, Casey B.K. Dominguez, Barbara Dorney, Elizabeth Dowling, Tracey L. Dowdeswell, Carolyn Dymond, Debbie Fitch, Susannah Goss, Verhan Henderson, Andrew Hostetler, Gudrun Klein, Heike Kubisch, Angie Lam, Ellen Lee, Valerie Lenhart, Kay Levine, Allison Lynn, Helena Maravilla, Carol B. Marley, Marion Maruschak, Michael McClelland, Rhonda Moats, Birgit Möller, Katja Neumann, Linda Peterson, Justin Powell, Paul Price, Xandra Rarden, Chris Reiter, Deborah Sadowski, Heidi Schulze, Heidi Sestrich, Keith Smith, Judith Thompson, Karen Varilla, Stuart Vizard, Danelle Winship.

It is difficult to single out one person as especially helpful. Despite the risks involved, we would like to highlight one person (see also Introduction). As shown in the front matter, beginning in the second year of the planning phase, Julia Delius served as our scientific editorial assistant. For our internal process of editorial review and management, Julia Delius was the mastermind of editorial coordination. Her work was simply outstanding.

Finally, we express our thanks to several individuals at Elsevier publishers whose work was both essential and helpful to us throughout. Barbara Barrett started the ball rolling for the entire Encyclopedia project, and was a master at negotiating out the fundamental arrangements at the beginning. Geraldine Billingham, as executive editor, also played an important role in the development of the project, as well as carrying the heavy responsibility for ensuring that all the financial and operational aspects of the project were realized. She executed this work with directness, skill, and tact. Angela Greenwell coordinated the editorial process with dexterity, calmness, and good judgment. Three persons were responsible for monitoring the progress of entries from Elsevier's side: Michael Lax for a time at the beginning; Jayne Harrison, who carried an overwhelming load of manuscripts month after month, and Helen Collins, who was responsible for the equally demanding job of shepherding the manuscripts through the entire production process. Ruth Glynn skillfully and imaginatively masterminded the development of the electronic version within Science Direct. We know how much the success of the Encyclopedia has depended on these individuals and their staffs, and our appreciation and admiration is here recorded.

Our expressions of gratitude and respect for the authors, section editors, reviewers, counselors, and editorial team, however, are not meant to distract from our own responsibilities as editors in chief. Let us hasten to add, therefore, that those whom we acknowledge deserve most of the credit but little of the blame for whatever shortcomings remain.

Neil J. Smelser
Paul B. Baltes

INTRODUCTION

Alan Sica's article in this encyclopedia observes, "The urge to systematize and rationalize both common and esoteric knowledge has been strongly and continuously in evidence for at least 2400 years in the West" (Sica, 2015). Sica dates the origins of this urge to Plato's nephew Speusippus, who took up the challenge of Plato's call for an *encyclopedia* (from Greek words meaning 'general education'), and traces the urge though Pliny the Elder, Vincent of Beauvois, Francis Bacon, Denis Diderot, and a great many others. Today, an encyclopedia is simply a self-contained reference work "with two aims: to include up-to-date knowledge about a particular discipline or group of disciplines and to make this knowledge conveniently accessible" (Smelser and Baltes, 2001). Such are the aspirations of the present work.

Histories of the concept of an encyclopedia are widely available and need not occupy us here. Those interested in where the *International Encyclopedia of the Social and Behavioral Sciences* (IESBS) fits into the long history of encyclopedias will do well to consult the Sica article quoted above or the Smelser—Baltes 'Introduction' to the first edition of this work.

This is the second edition (2/e) of the IESBS. Elsewhere, I acknowledge my immense debt to the editors of the first edition, Dr Neil Smelser and Dr Paul Baltes. Without their perspective and template to follow in assembling the second edition, this version would have scarcely been possible. The very thought of an encyclopedia covering *all* the social and behavioral sciences, one that drew on scholars from *all* corners of the globe, is itself so audacious that one would hesitate even to begin without a pretty detailed road map to the terrain.

On the occasion of the publication of Robert E.L. Faris's widely acclaimed *Handbook of Modern Sociology*, Joseph Gittler was moved to ask, "With the plethora of new handbooks, reviews, and compendia in sociology, one wonders whether there is a need for yet another one." That question was posed almost 50 years ago; the ensuing half-century has been marked, as Sica says, by "an avalanche of reference materials the likes of which had never been seen in libraries prior to about 2000." So readers and critics are within their rights to ask: Why a second edition? Why now?

The first edition (1/e) was reviewed in *Contemporary Psychology* as "the largest corpus of knowledge about the social and behavioral sciences in existence" (Park, 2004). According to readily available data sources, IESBS 1/e has been cited nearly 6000 times in subsequent scholarly literature and has an h-index ($h = 24$) that would be the envy of many full professors. Citations are only one measure of impact, of course, and probably not the most important measure for a basic reference work intended more for students and a general audience than for practicing professionals. In addition to the thousands of scholarly citations, items from IESBS 1/e were 'hit' almost two *million* times on Science Direct between online publication in November 2002 and August 2014 — two million instances where IESBS 1/e was likely consulted as a basic reference source, to get quickly up to speed in a new area of research or to provide background for a paper or project, or just to satisfy a reader's curiosity. The first edition, in short, emerged soon after publication as a go-to reference work throughout the social and behavioral sciences. Michael Shanahan referred to the first edition as "the atomic bomb of reference works." It was thus an easy conclusion that the work had sufficient value to keep it alive and current.

In reading selected articles from the first edition, however, I was taken aback by how much and how quickly they had aged. The first articles I looked at were those pertinent to my own areas of research and in nearly every case, there was important recent work that I felt needed to be discussed. With the assistance of colleagues in other areas of the social and behavioral sciences, it became obvious that this was a general problem. To be sure, much of the material in 1/e has enduring value; indeed, roughly half the articles in 2/e are updated and revised items from the first edition. Still, it is sobering to realize just how quickly the frontiers of social science

knowledge shift and thus how quickly a basic reference source becomes dated. I am certain there are articles in the current edition that are already in need of some updating.

Smelser and Baltes enumerated six criteria that guided their decisions about what to include and what to leave out. The criteria are as follows:

1. secure knowledge, realizing that security of knowledge is a dynamic and relative term,
2. knowledge with balance and comprehensiveness,
3. knowledge that is integrative rather than fragmented,
4. knowledge that places the evidence into historical and theoretical context,
5. knowledge that highlights connections between topics and fields, and
6. knowledge that combines, where possible, theory and practice.

I would like to say I have followed these same criteria in determining the content of 2/e, but all six criteria have proved problematic in one or another way and thus deserve some comment in light of the present work:

1. What is secure knowledge today is apt to be recognized as wrong tomorrow. Many of our requests for updates to 1/e articles generated some response to the effect, "All of this is completely obsolete. We need to write a new entry from scratch." One would expect this to be true of areas of research such as behavioral genetics, say, or cognitive neuroscience or other fast-moving scientific fields, but it also turns out to be true of archaeology, history, and philosophy. The leading edge of research in *every* discipline threatens received wisdom; those who content themselves with received wisdom ('secure knowledge') will quickly find themselves behind the times. So our charge to authors was to focus less on the 'secure knowledge' in their respective fields and more on the cutting edge — the new perspectives, methods, findings, and issues that will animate social and behavioral science research in the coming decade.
2. Throughout the social sciences, the distinction between theory and ideology is sometimes difficult to discern, and so too the distinction between applied research and community or political activism. We need not invoke Max Weber's conclusions about the impossibility of a truly value-free social science to understand that ideological undertones and political preferences can often be detected in social science research work; sometimes, they are quite explicit. Nor is it much of a surprise to learn that many social scientists struggle, not always successfully, to distinguish between what they want the world to be and what the world in fact is. Such struggles are part of the process by which knowledge develops and are thus in evidence in many of the 2/e articles. It would be unwise to enforce by editorial fiat a consensus on issues that the social sciences themselves have yet to resolve.
3. The fragmentation of knowledge *across* disciplines is far more serious that the fragmentation of knowledge *within* them, although the latter is a problem as well. Many well-informed sociologists, for example, take pride in reading widely and can speak with some authority about what is going on in the field, even in areas of sociology that do not directly concern them. I assume this is also true of the other social and behavioral science disciplines and areas. But rare is the sociologist who is cognizant of work being done, say, in social geography *even when*, as is often the case, the fundamental problems, theoretical issues, and methodological approaches are similar. This is a widespread problem across the disciplines: The evolutionary psychologists do not know as much as they should about what the anthropologists are doing; the economists ignore a lot of pertinent work in sociology and political science; etc. For better or worse, disciplinary differentiation is an inherent element in the process of knowledge development and discovery, so this is a reality to be faced, not a problem to be solved. We dealt with this reality mainly in two ways: (1) Authors were encouraged wherever possible to think across rather than strictly within their disciplines. (2) Calling relevant work done in other disciplines to the reader's attention was a guiding principle for the choice of cross-references for each article.
4. Social-constructionist theories of knowledge would argue that knowledge does not become knowledge until it is placed in historical, cultural, social, political, and theoretical context. As put very simply and succinctly in the opening line of the famous text by Berger and Luckmann, "reality is socially constructed" (1966: 1). This is no less true of social science knowledge than knowledge in any other realm. Unfortunately, a great deal of what we think of as social science knowledge is based on biased samples of WEIRD people — that is, Western, Educated, Industrialized, Rich, and Democratic (Henrich et al., 2010). (The same point has, of course, been made by many others.) The WEIRD, thus defined, represent a rather exotic minority group judged by world standards, and the challenge for IESBS 2/e was therefore twofold: (1) to recruit non-WEIRD editors and authors where possible; and (2) to persuade all authors to incorporate comparative, cross-cultural, and

international themes and perspectives wherever it was possible to do so. This effort was more effective in some sections than in others. Moving away from nation-specific literature, themes, and results to a truly *international* (the I in IESBS) account of the social and behavioral sciences was an ever-present *desideratum* in my discussions with editors and authors.

Alas, an emphasis on cross-culturalism often brings to light that everything, or nearly everything, seems to vary by culture, subgroup, ethnicity or nation, and at that point the question arises whether social science generalization is even possible. Are there universals that cross all social groupings? Or does social science dissolve into a mist of group-specific particularities that adduce no general principles? That hardly seems desirable. Yet myopic and ethnocentric fixations on one's own society or culture are scarcely to be encouraged either.

The worst offenders in this regard tend to be social scientists from the USA (and from the West more generally), who, of course, also comprise the largest share of editors and authors for IESBS 2/e. True, as with greenhouse gases, the USA (and the West) also produce the largest share of the world's science, social and otherwise, and so it is inevitable that they also represent the largest share of IESBS 2/e contributors. The Swedish social anthropologist Ulf Hannerz wrote about this very issue in his marvelous essay, "Editing Anthropology" (Hannerz, 2010). Hannerz quotes a Canadian anthropologist who said of the "neighborly presence" of US anthropology that it was like being "in bed with the elephant." The same is true of most or all of the disciplines covered in this work. But then in a passage remarkable for both its insight and its generosity, Hannerz remarks, "No doubt tensions and conflicts may arise out of this situation, but perhaps it is better to understand that the elephant cannot help being an elephant, and that it makes sense for it, in its habitat, to behave in elephantine ways. A well-trained elephant, too, can do a lot of good, such as in carrying heavy loads." So if the elephant that is Western social and behavioral science has been pressed to carry the heavier load in these pages, that is, the price to be paid for being an elephant in the first place.

The larger issue here is that the social and behavioral sciences, which were largely birthed in the West, in Europe and the United States, mainly address a trans-Atlantic scientific dialogue, a dialogue that is carried out almost exclusively in English. Indeed, throughout much of the world, a scientist's stature is indexed in part by his or her success in publishing in English. Publications in the native language are simply *assumed* to be inferior. The main exceptions, tellingly, are French and German social scientists whose native-language publications are valorized. A Dutch or Portuguese or Hungarian social scientist who only published in the native language would be seriously punished in merit and tenure reviews. Elsevier's citation database Scopus *requires* English-language abstracts before a journal will even be considered for inclusion. And English (with American spellings) is likewise the official language of this encyclopedia. No resources were made available to get articles submitted in other languages translated (although several such articles were submitted). Inevitably, this biases the encyclopedia's coverage in favor of social science addressed to the trans-Atlantic dialogue. Consequently, a great deal of excellent social science published in Spanish, or Mandarin, or Farsi, or any of the other world languages, is overlooked.

That said, steps were taken to improve the internationalism of the encyclopedia's coverage throughout the 4 years of its development. To begin, I sought area and section editors from around the globe and urged them whenever possible to seek international (vs strictly Western) authors. Articles were often returned to their authors with explicit instructions to add international coverage. And when all efforts failed and we ended up with articles that were unmistakably restricted to a single nation in their coverage (frequently but not always, this was the US), I indicated the national focus in the article subtitle. Still, a great deal more WEIRD social and behavioral science remains in these pages than would be desirable in an *international* encyclopedia. In a later section, I give the national breakdown of everyone involved in this project.

5. An encyclopedia that "highlights connections between topics and fields" is easier to envision than to accomplish. Criterion (3) above speaks to the disciplinary fragmentation of our social science knowledge. William Easterly, the NYU economist, has written about the 'tyranny of experts' but the tyranny of the disciplines is an equal problem, a tyranny sanctified by the very academic structure of the modern university, where the separate and often warring colleges are each comprised of assorted departments, the latter representing basic academic disciplines. Interdisciplinary programs are almost invariably relegated to various centers, institutes, or specialized research laboratories — in short, to the periphery of the university's power structure. And while everyone *says* they want to encourage multi- and interdisciplinarity, very little is done to make that happen. Instead, departments remain as the fundamental unit of academic organization.

   Hortatory admonitions to editors and authors have made IESBS 2/e somewhat more interdisciplinary than its several predecessors, but in the end, the disciplinary emphasis in many of our articles would be hard

to overlook. Still, there are many sections of the work that were clearly developed with interdisciplinarity in mind and in which one finds interdisciplinary social science at its current best: environmental and ecological sciences; health; life course; sexuality; GLBT studies; public policy; evolutionary sciences; war, peace, violence, and conflict; and genetics, behavior, history, and society are a few sections that come immediately to mind.

I am particularly pleased with the extensive coverage given in 2/e to the interactions between the biological and social sciences. Harry Whitaker once remarked in a private e-mail that "we are all witnesses to the marriage of biology and the social sciences." Many of the articles found here are offspring of that marriage. And those articles leave little doubt that the future offspring of this marriage will be among the most exciting and insightful social science products of the coming decade.

The social sciences once resisted everything biological as rank reductionism; in addition, the social scientists have always feared that a mature and complete biology would eventually drive us out of business. Articles included in IESBS 2/e make it clear that 'nature' versus 'nurture' was the wrong question from the very beginning, that what we need to understand is how biological inheritance and social and cultural forces *interact* to produce individual and collective outcomes. This is where a lot of the interesting action in the social sciences is going to be in the coming years.

6. The coverage of the practical or applied sides of the various disciplines has been increased in this edition, so the applied content of 2/e certainly exceeds that of its predecessor. New to this edition is the entire section on applied social and behavioral sciences; also new is our large section on social work and the separate section on applied, industrial and organizational psychology. But as Sara Strickhouser and I say in our article on the history of applied social research, "The history of 'applied social science' is indeed the history of the social sciences themselves" (Strickhouser and Wright, 2015). All of the social sciences in their modern form were birthed in the post-Enlightenment effort to understand why people, their institutions and society as a whole were as they were — why greed was more visible than generosity, why oppression was more common than freedom, why inequalities of various sorts characterized every social institution. To the founders of the disciplines, the modern distinction between basic and applied scientific concerns would have seemed meaningless, as indeed it was.

The Planning Phase and Editorial Structure

Elsevier's original acquisitions editor for this project, Scott Bentley, discussed the broad outlines of our attack on IESBS 2/e with me in a series of phone calls in the early months of 2010. By May 2010, certain of these outlines had come into sharp relief. There would be a single editor in chief with a tier of 'responsible lieutenants' to assist. These lieutenants started out as advisory editors but soon morphed into the 10 area editors in the final editorial structure. Each area editor would in turn oversee various sections and each section would have its own editor or editors. The original plan was that the area editors would each be responsible for approximately 400 articles and each section editor responsible for about 100 articles, so that no one would have an excessive amount of work compared to everyone else. In the end, however, some sections required more articles and others fewer, so the areas vary from fewer than 300 to more than 600 articles, and the sections vary from fewer than 30 articles to well more than 200.

Prior to my first discussions with Scott Bentley, Elsevier had commissioned about 20 'market surveys,' roughly half from professional librarians and the other half from academics, each focused on 'what was right and what was wrong' with the first edition. The most insistent demand that surfaced was for a fully electronic, computer-searchable work either in addition to or instead of a print version. In the end, both an e-version and a print version are being made available. But there were also consistent concerns expressed about spotty coverage of some areas: no coverage of social work to speak of; inadequate coverage of accounting, marketing, and business; no separate section of criminology; haphazard coverage of applied topics and concerns; and so on. And there were the predictable concerns about undue Western domination of the work.

Working from the 1/e Table of Contents and this stack of 20 surveys, I tinkered for a few months with how best to expand coverage to address the concerns our reviewers had expressed; the result was (more or less) the editorial structure shown elsewhere in the front matter of this work. Thus, the 53 sections of 2/e are basically the 39 sections of the first edition plus sections that were added to cover important emerging areas of research interest (e.g., gay, lesbian, bisexual, and transsexual studies) or to provide deeper coverage of disciplines and subdisciplines that the first edition treated lightly if at all (applied social and behavioral sciences, social work). A

few of the first edition sections were eliminated entirely: specifically, integrative concepts and issues (something of a catch-all category for 1/e articles that were highly interdisciplinary or simply did not fit anywhere else) and gender studies (gender is now so thoroughly integrated into the research and thinking of all the social and behavioral science disciplines and subdisciplines that a separate section was unnecessary and somewhat retrograde). Others were altered or expanded in significant ways (organizational and management studies, for example, became the second edition section on management, organizations, business, marketing and finance; expressive forms evolved into the 2/e section on culture and the arts; linguistics was subdivided into three separate sections; etc.) And some subdisciplinary areas that were part of other sections in the first edition were given their own sections in the second (life course studies; sexuality; criminology; labor studies; and war, peace, violence, and conflict are the most prominent examples), just to ensure adequate coverage.

The Introduction to 1/e (Smelser and Baltes, 2001) discusses at great length the intellectual architecture of the first edition and its evolution; the agonizing decisions about rules for the biographical articles; whether to organize the work by discipline, by concept, by an a priori taxonomy of social science knowledge, or in some other manner; and related structural matters. What resulted in 1/e was something of a hybrid model with some sections clearly representing specific disciplines, others representing 'overarching topics,' still others representing 'intersecting fields,' and so on. My task was far less challenging: I thought the architecture of the first edition served its purposes admirably and so I adopted it wholesale for the second edition, with the small modifications noted above.

While each of the 53 sections of 2/e has some more or less obvious justifying logic or substantive or disciplinary coherence, their arrangement into the 10 areas of the second edition does not. As already indicated, decisions about what sections to include and exclude were made very early in the development of the second edition, based on what was in the first edition, what Elsevier's marketing surveys suggested as significant lacunae, and my own sense of things. The arrangement of the sections into areas came later and was dictated largely by the interests and expertise of those who had been persuaded to sign onto the enterprise. Thus, all the Linguistics sections are in Area Five along with the cognitive and neuroscience sections because Harry Whitaker at Northern Michigan University had been a linguist first, a neuroscientist second, and a historian of psychology third. Likewise, Area Eight contains its seemingly chaotic hodgepodge of evolutionary sciences, genetics, religious studies, science and technology studies, and law because these happen to be the fields of interest of the redoubtable Barbara Prainsack of King's College, London, whose editorial talents are as deep as her interests are broad. Simplifying only slightly, section editors were chosen for their substantive expertise in particular areas of research (as well as their international or cultural 'range'); the plan was that section editors would review each of their articles for completeness of coverage, currency, fairness, and the like. In contrast, area editors were chosen for their breadth of interest and knowledge spanning multiple sections – people who by nature, experience, and training would be good at seeing the big picture. The role of the area editors was to assure that the articles were at least modestly international and interdisciplinary and formed some sort of coherent whole.

As laid out in an early e-mail to one of the area editors, "In my mind, Advisory [Area] Editors are generalists and Section Editors are content specialists. The Section Editors need to bring breadth of knowledge to their responsibilities, of course, but the primary job requirement is expert understanding of the particular field or section. We need section editors who can commission pieces that adequately review past developments in the subject area, but who can also shape their portfolios to identify major unanswered questions and new research developments." This was the general model followed throughout the recruitment process.

The approach just sketched inevitably left a residual area made of up sections that none of the other area editors were willing or able to claim. That proved to be Area Ten. A very large number of scholars from various disciplines and world regions were approached about serving as the Area Ten Editor. All demurred until I approached Martin Bulmer of the University of Surrey, who served the project for about a year but was unable to continue and subsequently left the Board. So for the final year of the project, the editing of Area Ten was done mainly by me.

The online subject classification for IESBS 1/e did not correspond precisely to the sections of the first edition; the subject classifications listed articles by broad general topic regardless of which 1/e section developed them. So for the first year or so, my assistants and I labored to assign every 1/e topic to one of the 53 2/e sections. With 53 sections to populate with articles and about 4000 articles to classify, the process of assigning articles to unique sections occupied huge amounts of time and generated endlessly complicated spreadsheets. (After about a year of this, a document surfaced in the Elsevier archives that showed exactly where each 1/e article had originated.)

Along with populating the 2/e sections with articles, searching for area and section editors occupied a major part of the early going. The original idea was to identify the 10 area editors first and then enlist them in the

search for their section editors, but in fact, these processes were simultaneous and were about half-completed when the two planning meetings were held: the first in San Diego on 19 and 20 May 2011; the second in London on 5–7 June 2011. Although not part of the plan, the first meeting was mostly attended by area editors and the second, by section editors.

The agenda for both meetings was largely identical: achieve clarity on the respective roles of the various editors; solicit advice on filling the unfilled editorial slots; get buy-in on the project *mantra* (internationalism, interdisciplinarity, inclusiveness!); explain the relationship between the first and second editions (e.g., that all 1/e authors would be offered the opportunity to update their articles); explain the process of assigning articles to sections; and the like. In almost all cases, consensus was quickly forthcoming.

The largest substantive change in the second edition is the treatment of psychology. (Whether measured by students, practitioners, professors or programs, psychology is the largest of the social and behavioral sciences.) In the first edition, the whole of psychology was contained within four large sections: clinical and applied psychology; developmental, social, personality, and motivational psychology; cognitive psychology and cognitive science; and behavioral and cognitive neuroscience. Cognitive science and neuroscience are, of course, rapidly growing sectors of the psychological discipline and it seemed appropriate to devote an entire area of the second edition to them. This area contained seven separate sections (three of them devoted to linguistics). And the 'softer' psychological sciences were placed in a separate area comprised of eight sections (including psychiatry and social work). These changes were made to assure that 2/e had adequate coverage of the entire psychological enterprise (a concern that was raised in some of the reviews of 1/e).

The structure of the editorial team was developed to serve two purposes: first, to divide up the labor into manageable parts; and secondly, to assure that every article in the final product would be reviewed by at least three scholars: the respective section editor, area editor, and the editor in chief. Since we were all aware of one another's identities throughout, the review process was not blinded, but every article in this work has been thoroughly peer-reviewed and vetted. In many cases, these articles have been through four, five, six, or even more revisions before being accepted for inclusion in the work.

Recruiting Editors and Authors

IESBS 2/e faced two different recruiting tasks: recruiting editors and recruiting authors. As indicated elsewhere, the original plan was that I would recruit area editors largely from my own personal networks and they in turn would recruit their section editors. In practice, the process was much more convoluted. First off, many of my 'first choice' candidates were hesitant to involve themselves in such a daunting and ambitious project. In some cases, an initial agreement to come aboard was followed a few weeks or months later by withdrawal as the true scope of work came into sharper focus. Some people that I tried to recruit as area editors demurred but agreed to serve as section editors; in other cases, candidates for area editors were nominated by section editors. In a couple of cases, there was a complete team of section editors prior to the successful recruitment of a corresponding area editor. And so on. The process of assembling an editorial team for the project was by no means linear.

Personal networks – mine and those of the people I persuaded to sign on – were the largest single source of ideas for other editors, by far. But personal networks tend to follow disciplinary and national lines and become rather quickly exhausted. In selecting both editors and authors, it was of course essential that all relevant perspectives be covered and that the breadth of fields was adequately represented. So other sources of ideas were tapped: the expertise of the Major Reference Works team at Elsevier; editorial boards of leading journals in the respective fields; Google Scholar citation counts; the knowledge and networks of people who had been involved in preparing the first edition – basically, anywhere names of top scholars in particular areas could be located. I did not keep systematic track of the number of people approached, much less of the outcomes; but in reviewing my e-mail archives from the early period of the project, I probably asked (on average) somewhere between six and eight prospects before I found someone to agree (an average that was highly variable across the areas and sections).

In the initial plan, area editors would recruit their own section editors and the section editors would in turn recruit their own authors, but the reality was again different. Inevitably, my negotiations with prospective editors (both types) would often result in a declination of the editorial role but an offer to write an article on a particular topic (or topics), offers I readily accepted. So in some cases, I had committed authors of particular articles well before I had the corresponding section or area editor in place. And many of the section editors likewise leaned on their area editors and on me for author suggestions, contacts, and outreach. So all the editors

were involved in locating willing authors (and not coincidentally, in making suggestions for articles to be included in the final work).

No one was asked to keep precise statistics on how many authors were sought before an agreeable author was found. My sense is that the 2/e editors had a somewhat tougher time with this than the 1/e editors had (but on the other hand, the 2/e editors had all the 1/e authors to work with, which Smelser and Baltes certainly did not have). The 1/e editors report that about 60% of those invited to write articles agreed to do so on the first 'ask' (with equivalent success rates in each subsequent 'ask'). In 2/e (or so I would guess), the success rate was probably closer to 50% and possibly even lower. They also report that something in excess of 90% of those who agreed to write for 1/e in fact contributed "acceptable entries in time to be included…" In the 2/e case, we found ourselves still soliciting authors within a few weeks of the submission deadline and some dozens of authors pulled out of the project at the last minute. Still, when all the dust settled, there were just about 800 articles planned for both editions that never materialized and both editions ended up with just fewer than 4000 articles. Perhaps these are 'natural limits' for a work of this sort.

Biographies*

In the Introduction to 1/e, Smelser and Baltes provided a short history of and rationale for the decision to include a limited number of biographical articles (150 of them, to be exact). This was evidently a controversial and contested decision since some of those associated with 1/e felt that biographical articles had no place in an encyclopedia focused on substantive knowledge (versus the personalities of those who produced it). As Newton said (paraphrasing a passage from Bernard of Chartres), "If I have seen further, it is by standing on the shoulders of giants" (a passage made famous among social scientists by Robert K. Merton's *On the Shoulders of Giants* (1965)). In other words, discovery is only possible because its discoverer is able to refer to knowledge already gathered and accumulated by his or her predecessors; and since all discoveries – small and large, substantial and minor – contribute to the production and accumulation of knowledge, singling out particular scholars for special attention would be both pointless and invidious.

This position, although understandable, was abandoned in the first edition and remains so in the second, largely because it is not possible to understand the social sciences without knowing the individuals who contributed to it. C. Wright Mills once defined the sociological imagination as the intersection of biography and history (Mills, 1959). To know the social sciences therefore requires biographical and historical knowledge. The social sciences are distinguished from the physical and biological sciences in the way they produce knowledge because individual human beings, including social scientists, invest meaning in their actions. Only through understanding the meaning that individuals give to their actions are social scientists able to provide explanations of human behavior and its outcomes. And what applies to social action in general applies to the production of social science knowledge as well. It thus makes sense to include biographical accounts of social science personages who have been particularly distinguished in making sense of human action and have in turn made major contributions to social science knowledge. To acknowledge individual social scientists with biographical articles is also to acknowledge their special and particular insights.

Once the decision was made to include biographies in 1/e, the next major decision was whom to include and whom to leave out. Two arbitrary but defensible principles governed these decisions: (1) the total number of biographies was not to exceed 150 (chosen because it seemed like a manageable number) and (2) only biographies of the dead would be included. The 1/e section editor for biographies, Karl Ulrich Mayer, consulted handbooks and encyclopedias, asked other section editors to name and rank the most important names in their respective disciplines, ran citation checks, and finally submitted a consolidated list to various experts for review. This resulted in some additions and some deletions and in the end 147 biographies made it into the first edition.

Instructions to authors writing these biographies directed them to include "a brief sketch of the major dates and events in the life of the biographee," to describe "the major contours of the [person's] substantive contribution," and to highlight the "importance and relevance of the biographee's work for the social and behavioral sciences." Largely the same instructions were given to 2/e biographers.

The selection criteria for 2/e were very different. First, on the reasoning that well-done biographies of leading figures is one of the things that draw readers to a work such as this, the total number of biographies was

* My thanks to Andreas Hess for drafting this section of the Introduction.

increased by more than 100 (to just over 250). In a major departure from 1/e, much of the increase is made up of biographies of the living. The 1/e restriction that excluded living persons resulted in anomalies that we thought needed to be addressed. As life expectancy has expanded in the twentieth and twenty-first centuries, so have the life spans of social scientists. Claude Levi-Strauss, to cite one obvious example, lived to the age of 101 years. When 1/e was published, he was in his 90s, was widely cited, was recognized universally as a modern classic, indeed a genius, of social anthropology – and yet, owing simply to his longevity, he was not included in the 1/e biographies. Biographies of, for example, the economist Herbert Simon, the political economist Albert O. Hirschman, the sociologist and philosopher Jürgen Habermas, and the linguist Noam Chomsky were all excluded for the same reason; indeed, Habermas and Chomsky still live as this is being written (Fall, 2014). In all these cases, the major works had been produced decades earlier, their major imprints on the social and behavioral sciences were already evident, their eventual inclusion in works such as this was inevitable. Are readers to be deprived of accounts of their lives, times, and contributions just because they have survived into deep old age?

Once the decision was made to include biographies of the living, however, it was not always easy to decide who among the living merited inclusion. Often the editors had to make decisions on a case-by-case basis, frequently in extended consultation with colleagues or experts in the field. Criteria used to make these decisions were whether the potential biographee had a reputation beyond one culture, nation, or language group; whether there was a record of sustained production over several decades; and whether there was an impact beyond the confines of a single discipline. These criteria reduced our list of suggested biographees considerably. Early lists of candidates numbered as many as 200 new names (in addition to the 147 biographies included in 1/e). In the end, as noted earlier, somewhat more than 100 new names were added.

In a few cases, persons were included that arguably did not satisfy our inclusion criteria. One such is Raul Hilberg, who became famous mainly for having written one very important book, *The Destruction of the European Jews* (1961). Hilberg's book is still regarded as the seminal work in Holocaust studies, a field of research that came to prominence much later; we felt that his signal contributions to Holocaust studies merited a biographical article. Much the same could be said, perhaps, of André Gorz, a well-known social theorist from France, and Albert Memmi, whose work is on colonialism, anticolonialism, and racism. These and other examples could and probably will raise questions about the porousness of our criteria. Whether we were right in giving 'trespassers' their space is open to debate. In any case, whether Hilberg, Gorz, Memmi, and others do or do not merit their biographies is for readers, not us, to decide.

Other important changes in the 2/e biographies section include, first, a conscious effort to attain a better gender balance, including more women both as biographees and as authors; and second, expanding the biographies both geographically and culturally. In the end we made some inroads in both respects but fell short of our internal goals. One of the main reasons for this is that any encyclopedia must, in the first instance, be true to the disciplines it represents. This means being true to the real status of important players, their networks and disciplinary power relations, and their academic capital in their respective fields and beyond. Change in these respects has been noticeable; certainly, the growth of the social sciences in Asia has been remarkable; and in most disciplines, the proportional presence of women has increased. But modest change in the right direction does not a revolution make. Too many nonwhite, non-Western, and nonmale practitioners are still being left out on the disciplinary peripheries and are not fully represented – not in their home disciplines and not in our encyclopedia either.

We state this fact with regret. In many cases, the limiting factor is not excellence but simple visibility. Being part of the trans-Atlantic social science dialogue and engaging this dialog mainly in English translates into more visibility, as discussed earlier. This gets a scholar on the radar screen. Equally excellent work engaging other intellectual dialogues in languages other than English does not. A great many outstanding scholars have thus gone unrecognized in 2/e for precisely this reason. That being said, strenuous efforts were made to make the 2/e biographies more inclusive. Among those included are the Argentinean educationalist Sarmiento, the Brazilian sociologist Cardoso, and the Japanese political scientist Maruyama, to name just a few. This is, however, 'just a few' of the many dozens of prominent social and behavioral scientists 'out there' whom we would have included had we been given more time and more resources (to get non-English works translated, for example). We do feel that we have made some important inroads and beg the reader's understanding of the limits within which we worked. We can only hope that the next edition will strive for more inclusiveness and better representation than we were able to achieve.

Another entirely new feature in the 2/e biographies is the series of 'collective biographies.' In many instances, the intellectual lives of individuals who work in research groups intersect and form a network that makes the

entire group (or paradigm) successful. Examples include articles on the Durkheimians, the Annales School, the Frankfurt School, and several others.

As indicated earlier, instructions to authors were changed little from 1/e. All authors were asked (1) to include the most important biographical facts (country of origin, generation, education, influences, other formative experiences, networks, etc.); (2) to list the most important output (discoveries, publications, etc.) and to briefly discuss the subject matter and content of the most important publications or discoveries; (3) to look at the lasting impact of the person and his or her work (if possible, beyond just one discipline, language group, or culture); and (4) to provide a bibliography of primary and secondary sources related to the biographee and his or her work. Most authors stuck to these guidelines.

Finally, we state for the record that there are a number of important social and behavioral scientists that we would have liked to include but for whom we were unable to find a proper biographer. The search for biographers went on for nearly 4 years. In many cases, our first-choice author agreed at once, but in other cases, we approached four, five, or even more people before an agreeable author was found. And in about two dozen cases, no such author was ever found, with the result that a deserving person's biography had to be dropped. Forgoing a case-by-case discussion of these deletions, let it be simply noted that this is why we have not included biographies of people such as Amartya Sen, the economist and social philosopher; Raymond Boudon, the French sociologist; Ronald Dworkin, the legal theorist; Avishai Margalit, the philosopher; or a collective article for the British Marxist historians (Eric Hobsbawm, E.P. Thompson, Christopher Hill, and Perry Anderson). Perhaps our most regrettable omission is Neil Smelser himself, for whom no biographer could be found despite at least a dozen attempts. (Paul Baltes's biography is included.) Neil is one of the giants on whose shoulders we all stand.

Redundancy

I mentioned earlier that in the beginning of the project, there was no 'map' linking each of the 1/e articles to its respective 1/e Section. Our efforts to create such a map invariably bogged down every time we hit an article that could plausibly belong to any of several sections, which was often. Obviously, it would have been possible to force every article into a 2/e section, but at the time it seemed advisable to involve the editors themselves in these decisions. So on numerous occasions, I distributed lists of 'orphaned' articles (articles for which no home had yet been designated) to the area and section editors, asking for foster parents to volunteer. Eventually, of course, every article found a home, but at a relatively late date in the process, I became aware that a few dozen articles had found more than one home. That is, some of the editors adopted articles without filing the appropriate paperwork with the editor in chief! In such cases, the result was two articles on the 'same' topic. (The 2/e Table of Contents was scoured multiple times looking for precisely these kinds of duplications but in the end, several proved elusive.)

In the large majority of cases, the content of the 'duplicate' articles was sufficiently distinct that both articles were retained, often with some retitling to help readers differentiate between them. For example, readers will find two articles on 'social identity.' One was recruited for the section on social psychology; the other for the sociology section. With rare exception, the two articles discuss different aspects of social identity from entirely different disciplinary angles; indeed, the two articles share only a small handful of common references. So it was an easy decision to retain them both: one appears here as Social Identity in Social Psychology; the other as Social Identity in Sociology. Careful readers will find perhaps a score of similar cases in the encyclopedia.

Alas, in a few regrettable cases, the overlap between duplicate articles was so pronounced that one of the articles had to be deleted. Since by the time these problems surfaced the articles had (often) been written and rewritten several times and had been accepted by both the section and area editors, the last-minute decision to delete a redundant article was painful. My sincere apologies to the authors involved.

Some redundancy in a work of this scope and aspiration is not only inevitable, it is probably also desirable. A reader interested in, say, social inequality will (one hopes) want to know what the sociologists, anthropologists, economists, and geographers all have to say about that topic. And if a few of the many articles on the topic say more or less the same thing, then what harm is done? Editors at all levels were asked to be alert to redundancies across articles and the editorial record shows that many were. That being said, quite a bit of topical redundancy no doubt remains, and that is not (in general) a matter of concern. It is what Smelser and Baltes refer to as the "inevitable residue of overlapping."

The Review Process

Once the table of contents had stabilized, each of the editors was asked to review the 1/e articles assigned to their section or area and come to various decisions. In some cases, 1/e articles could be reprinted more or less 'as is,' with perhaps some updating of references for readers seeking entry points into the current literature. This was especially the case with what were eventually designated as 'legacy articles,' e.g., Gabriel Almond's article on Civic Culture, James Gregor's article on Dictatorship, &c. In other cases, the 1/e articles needed some updating to be suitable for 2/e, either by their original authors when available or by others recruited specifically for the purpose. The general rule was that all 1/e authors would be offered the opportunity to do the updates themselves, and that other authors would be sought in the event of the original authors' declinations. In still other cases, the 1/e article was so obsolete than an entirely new article would be required. And then finally, the review of 1/e articles often revealed areas of current research that were inadequately covered; in these cases too, completely new articles would be sought.

Where appropriate, the relationship between the 1/e and 2/e versions of an article is spelled out in the article tagline. In many cases, there were issues of authorship to resolve — a 1/e article written by *X* and completely revised by *Y* is *Y*'s article although *X* might be identified in the tagline; but what of an article written by *X*, now deceased, and only modestly revised and updated by *Y*? Every decision rule that I formulated to resolve such issues soon confronted an exceptional case where the rule did not seem to apply. So in the end, the only workable rule was that everyone should get proper credit for their intellectual property, whether prime author or reviser, whether living or dead. If exceptions to this rule have crept into the final product (as they almost certainly have), I offer my apologies to those whose work has been slighted or improperly recognized. Deciding on proper authorship for many of our articles was a far more involved and difficult task than expected.

The section editors formed the first line of editorial defense and were the ones to whom article drafts were originally submitted. The section editors read and commented upon the draft articles and returned them to authors for revision. It is a rare article that appears here in its original form: on average, articles were revised two or three times before being sent to the area editors and subsequently on to me; in many cases, it was more like five or six revisions, with subsequent revisions at the request of the area editors and the editor in chief. And in some cases, articles were submitted to outside readers for independent review. As I stated earlier, the reviewing process was not blind, but it was quite thorough, as is reflected in the exceptional quality of the final product.

Internationalism and Inclusivity

A truly *International* Encyclopedia of the Social and Behavioral Sciences would of course require a global network of editors and authors *and* a commitment to internationalize the content of the work wherever possible. With respect to the editorial team for 2/e, this was definitely realized. The section editors and editors in chief who produced the first edition were drawn from only nine countries: The United States, Germany, Italy, Canada, Sweden, Australia, France, Switzerland, and the UK. Two-thirds of those editors were from the USA and only 13% were women. Area and section editors for 2/e represent 21 countries, US scholars make up only 38% of the total, and women comprise 36%. Thus, the proportional representation of women among the editors was nearly tripled in 2/e over 1/e while the predominance of the USA was halved. Nations represented among the editors of 2/e that were not represented in 1/e include Luxembourg, Greece, Finland, Japan, China, Ireland, Singapore, Spain, Russia, Austria, Israel, and the Netherlands. The presence of several Asian nations on this list is particularly gratifying. To be sure, the North Americans and Western Europeans still predominate, but they no longer monopolize the field.

Adding the International Board of Consulting Editors (see the following statement of Acknowledgments) increases the internationalism of the editorial team even further. Of the 45 members of that Board, only 12 (27%) are US social and behavioral scientists. Countries represented on that Board that are not otherwise part of the editorial team include three Central and South American nations (Venezuela, Argentina, Costa Rica), several Asian nations (the Philippines, Malaysia, South Korea, India), a few Western European nations (Norway, Denmark), two representatives from Central and Eastern Europe (Hungary, Croatia), two from the Middle East (Lebanon, Qatar), and one from South Africa. These editions bring to 35 the total number of countries with representation on the IESBS editorial team.

Much the same can be said of the 2/e authors, who are also more international than the 1/e authors had been. Smelser and Baltes noted in their Introduction that while authors from 51 nations were represented in the work,

58% of the authors were from North America and another 35% were from (mainly Western) Europe. "As to gender composition, 21% of the [1/e] authors were women." In 2/e, the proportion of women among the authors has increased slightly to approximately 25% and the percentage of North American authors has declined to fewer than half. Again, North America and Western Europe still contribute the larger share of the 2/e authors but the growing representation of social and behavioral science authors outside the West is both noteworthy and encouraging.

Another important point is that the international scope of the project is much more pronounced than editors' and authors' current affiliations would lead one to conclude. (This would have been equally true in 1/e as well.) Consider, for example, Michiru Nagatsu, author of our article 03053 on the history of behavioral economics. Dr Nagatsu was born in Japan and retains Japanese citizenship but was educated at Exeter and the London School of Economics and Political Science and wrote his IESBS 2/e article while on a postdoctoral fellowship in Finland. Or Guillermina Jasso, area editor for Area Three. Jasso was born in the USA, received her PhD from Johns Hopkins, and is on the faculty at New York University. By any standard, she would count as a US sociologist in our compilations. Yet her parents were Mexican of Basque, Spanish, Portuguese, and Dutch origins; Spanish is her native language; over the course of her distinguished career, she has published with coauthors from Germany, India, Israel, Mexico, the Netherlands, and Sweden; and she holds a permanent research fellowship at IZA, the Institute for the Study of Labor, in Bonn, Germany. Scoring her as 'USA' scarcely does justice to her biography or to the international perspective she brought to the editorial task.

What is true of author Nagatsu and editor Jasso is true in degrees of virtually the entire roster of IESBS participants. If one includes place of birth, citizenship, where educated, sites of research, visiting appointments, sites of fellowships, honorary professorships, invited lectures, and on through the list of highlights in a modern academic career, it is safe to say that every nook and cranny of the globe (save, possibly, Antarctica) is represented somewhere in the biographies of IESBS authors and editors. The true measure of internationalism, in short, is not so much where people come from or where they currently are, but rather the extent to which they bring a sensitivity and commitment to cultural and national differences into their work. Whether this was or was not realized in 2/e is for readers to decide.

Concluding Observations

Smelser and Baltes aspired in the first edition of this work to "assemble the whole range of knowledge – vast and complex as it is – of the social and behavioral sciences in one place." Since what does and does not qualify as 'social and behavioral science' is itself contested, it is not surprising that nearly every one of the market reviews commissioned by Elsevier to guide the development of the current edition noted content omissions in 1/e that reduced its usefulness and that needed to be addressed in a second edition. Critics can and no doubt will say the same about 2/e. I have already mentioned the nearly 800 articles that appeared on the 2/e Table of Contents at one time or another but that will not be found in the final product, either because agreeable authors could not be located or (less often) because agreeable authors never produced an acceptable article. And it is pretty easy to identify whole chunks of present-day social and behavioral science that are given short shrift, or no shrift at all, in this work – not because these chunks were judged to be unimportant but because limits of time, space, resources, and networks meant that some elements of the contemporary social science enterprise never came to our attention.

The social and behavioral sciences begin with what artificial intelligence guru Marvin Minsky once described as a "three pound computer made out of meat" – the human brain, which for all we know is the most complicated three-pound hunk of matter in the universe – and end with a thoroughly globalized culture and social structure that encompasses all aspects of our species' physical, biological, psychological, social, emotional, cultural, and spiritual lives. We are the most successful species ever to have inhabited the planet; we have colonized every inhabitable piece of dirt; our range extends everywhere; all the earth's resources lay at our command. To record all that has come to be known about human origins, evolution, language, culture, and social structure – everything we know about human emotions, identity, love, religion, family, economics, politics, domination, exploitation, and on through a very long list – would require orders of magnitude more volumes than the mere 26 volumes that comprise the present work.

We have come increasingly to the realization that what is social and human about our species is very intimately connected to our biological, genetic, and evolutionary inheritance. At the same time, the brain specifically and biological evolution more generally "cannot be viewed separately from the material, historical and

social circumstances that produce it" (Berntsen and Baker, 2015). As these authors put it, biology and culture are 'mutually constitutive.' Fifteen years ago, the editors of the first edition remarked on "ferment at the boundaries between the biological and the behavioral and social sciences." And while there are still important controversies, much of the ferment has yielded to cooperation as we are just now beginning to explore this endlessly complex web of interconnectedness between our biological and social selves. It is an easy and nearly inevitable conclusion, thus, that the third edition of the IESBS will contain a great deal more of the work being done at this intersection than 2/e was able to accommodate.

To conclude on a purely personal note, the 5 years I have spent working on this project produced many professional and personal gratifications, none quite so delicious as the certain knowledge that I would learn something new every single day. My work on 2/e exposed me to literature I never knew existed and to aspects of the social and behavioral sciences of which I was at best dimly aware. I can only hope that readers who come to these pages will find them as enriching as I have.

ACKNOWLEDGMENTS

A work of this scale is inevitably a communal enterprise involving many hundreds of editors, authors, reviewers, technical support people, colleagues, professional acquaintances, and friends who have provided input, advice, encouragement, and assistance over the past five years. Any listing is bound to be incomplete, so my apologies in advance to those who expected to be mentioned here but are not. Be assured that the slight is not intentional.

My negotiations with Elsevier about this project began early in 2010. By May of that year, I had committed to the project and have been working on it at varying levels of intensity ever since — often on weekends, during holidays, and whenever else I could snatch a useable chunk of time. So my first acknowledgment must be to my wife Chris for suffering through my five year obsession, always with understanding and affection, usually with good cheer. Chris is probably the only person in the world who is happier than I am that the project is now completed.

I must also acknowledge an enormous intellectual debt to the editors in chief of the first edition of the *International Encyclopedia of the Social and Behavioral Sciences*, Drs Neil Smelser and Paul Baltes (the latter now deceased). Dr Smelser was gracious enough to serve as Chair Emeritus of the project's International Board of Consulting Editors and to put himself at my disposal as, in his words, "a battle-scarred veteran." The basic intellectual structure of this work is adopted more or less wholesale from the Smelser—Baltes edition, with a few exceptions noted earlier in the *Introduction*. Without the original to serve as the starting point and blueprint, it is hard to imagine even embarking on such a task, much less bringing it to completion. Their edition was hailed as "the largest corpus of knowledge about the social and behavioral sciences in existence," which is to say that it formed an *extremely* solid foundation from which to build the work you now hold in your hands.

The first edition was organized into 39 sections overseen by a team of 53 section editors. The structure of the second edition is slightly different. It is divided up into 10 broad 'Areas,' each with an Area Editor overseeing the work of between four and eight Section Editors. In all, the second edition is thus comprised of the 10 Areas subdivided into 53 Sections; the 53 Sections were developed by a team of 76 Section Editors. So whereas Smelser and Baltes had 53 colleagues to help complete the work, I had 84 (two of the Area Editors also edited their own sections). On pages i-v in the front matter to this work one finds an Editorial Board list showing the Area Editors, Section Editors, Sections, names, and affiliations of the entire editorial team — a team whose dedication and effort in behalf of the project has vastly exceeded the rate of pay. A more helpful, productive, or delightful group of scholarly collaborators is difficult to imagine.

What readers see in the listed Editorial Structure of the work is the *final* editorial team as it existed when the work went into production. As would be expected in a project of this duration, there was considerable turnover within the team as the project developed and as death, competing demands, and general indifference all took their toll. I am grateful, nonetheless, to everyone who agreed, at least initially, to participate in the project, whether or not they were able to stay involved to the very end.

Susan Hanson (Geography) and Ulf Hannerz (Anthropology) are owed a special note of thanks because, of the 53 Section Editors involved in the first edition, these are the only two who agreed to reprise their roles in the second. (Both also wisely requested and received coeditors to carry part of the load.) Persuading people to serve who had no real idea what they were getting into was challenge enough, but these two suffered through 1/e and were willing to do it all over again for 2/e. And for that, I am especially grateful.

Many of the editors benefitted from the assistance of colleagues and graduate students at their various institutions. There was no mechanism built into the editorial process to keep systematic track of this

assistance and so the listing below is certain to be incomplete. But I can at least acknowledge those of whom I am aware who contributed time and intellectual energy to the effort: Liam Morton and Andrea Livingstone (Psychiatry); Jennifer O'Connor and Alana Dorris (Applied, Industrial and Organizational Psychology); Jen Hanis-Martin (Sexuality); David Budde, Annette Stimmer, Nikolas Ott, and Franziska Pfeifer (Institutions and Infrastructure of Social and Behavioral Sciences); Matthew LeDuc and Scott Freeman (Contemporary Cultural Concerns); and Simone Dudziak (Public Policy). To those named, my thanks. To those omitted, my apologies.

A special note of thanks to Dr Donald J. Barrett. Don was originally recruited to develop an entirely new section of the second edition on Gay, Lesbian, Bisexual, and Transsexual Studies, completed the section in short order, then e-mailed me to ask if there was anything further he could do to be helpful. Consequently, he took a major hand in developing the section on Biographies and was quite helpful with many other sections too. He appears in the Editorial Structure both as a Section Editor and as a Senior Editorial Associate to acknowledge his yeoman service to the entire enterprise. Also listed as a Senior Editorial Associate is my colleague Dr Amy M. Donley, who has been with the project since the very beginning and who, more than once, was all that stood between me and madness. I am proud to count them both as colleagues, collaborators, and friends.

I am also pleased to acknowledge Don Barrett, Andreas Hess, Harry Whitaker, John Berry, Barbara Miller, Scott Bentley, and Claire Byrne for their incisive and helpful commentary on previous drafts of the Acknowledgments and Editor's Introduction.

The project's International Board of Consulting Editors, chaired by Smelser and Dr Peter Marsden of Harvard University, was formed late in 2011 as a 'sounding board' to be used by the Area and Section Editors in searching for topics and authors and to help push for greater internationalism in our coverage. As it turned out, several members of this Board also stepped up to write entries in their areas of expertise. The composition of this Board and the affiliations of the consulting editors (as they were when the Board was first formed, not necessarily as they are today) are as follows: Neil J. Smelser, *University of California, USA*; Peter V. Marsden, *Harvard University, USA*; Ronald F. Abler, *International Geographical Union, USA*; John Bacon-Shone, *University of Hong Kong, China*; Roberto Briceño-León, *Universidad Central de Venezuela, Venezuela*; Roel Bosker, *Rijksuniversiteit Groningen, The Netherlands*; Michael Burawoy, *University of California, Berkeley, USA*; Nestor T. Castro, *University of the Philippines, Philippines*; Dalton Conley, *New York University, USA*; Freek Cronjé, *North West University, South Africa*; Scott Davies, *McMaster University, Canada*; Abdul Rahman Haji Embong, *Malaysian Social Science Association, Malaysia*; Joan-Maria Esteban, *Barcelona Graduate School of Economics, Spain*; Robert S. Feldman, *University of Massachusetts, USA*; Sari Hanafi, *American University of Beirut, Lebanon*; Gudmund Hernes, *Norwegian Business School, Norway*; Sheila Jasanoff, *Harvard University, USA*; Tim Jensen, *University of Southern Denmark, Denmark*; Colin Jones, *University of London, UK*; Nadezhda Lebedeva, *Higher School of Economics; and National Research University, Russia*; Miklós Lévay, *Eötvös Lorand University, Hungary*; Dinka Marinovic Jerolimov, *Institute for Social Research, Croatia*; Laurie M. Joyner, *Rollins College, USA*; Ferenc Kiefer, *Hungarian Academy of Sciences, Hungary*; Pan Suk Kim, *Yonsei University, South Korea*; Katsuya Kodama, *International Peace Research Association; and Mie University, Japan*; Allan Lavell, *Facultad Latinoamericana de Ciencias Sociales (FLACSO), Costa Rica*; Jake Lynch, *University of Sydney, Australia*; Cecilia Mabragana, *Consejo Nacional de Investigaciones Cientificas y Tecnicas (CONICET), Argentina*; William McBride, *Purdue University, USA*; Ishwar Modi, *University of Rajasthan, India*; Leonardo Morlino, *School of Government, Italy*; Melvin L. Oliver, *University of California, USA*; Angela M. O'Rand, *Duke University, USA*; Kenneth Prewitt, *Columbia University, USA*; Thilo Rehren, *University College London Qatar, Qatar*; Colette Sabatier, *Université Victor Segalen, France*; Philip Schofield, *University College, UK*; Rainer K. Silbereisen, *University of Jena, Germany*; Chamhuri bin Siwar, *National University of Malaysia, Malaysia*; Tom W. Smith, *World Association for Public Opinion Research, USA*; Catalina Smulovitz, *Universidad Torcuato Di Tella Miñones, Argentina*; Philip Spinhoven, *Leiden University, The Netherlands*; Sukhadeo Thorat, *Indian Council of Social Science Research, India*; Nigel Thrift, *University of Warwick, UK*; John R. Townshend, *University of Maryland, USA*; Gisèle Yasmeen, *Social Sciences and Humanities Research Council of Canada, Canada*.

Searching for an editorial team to represent every social science discipline and every region of the globe quickly exposed the deficiencies in my personal network, so I am indebted to a very large number of scholars around the world for calling names of prospects to my attention, allowing me to drop their names in the recruitment effort, or otherwise helping me find people with the expertise and commitment required for the job. In most cases, this is a list of people who were invited onto the editorial team in some capacity,

demurred, but made valuable suggestions about others to contact. In several cases, people are listed because they engaged me in intellectual discussions about the structure, format, and even advisability of this work, or simply replied to a cold-call e-mail in pleasant, kind, helpful, or informative ways. Again ignoring the risk of omission, my sincere personal thanks to those named below for their contributions large and small to the final product:

Doug Anderton, Juri Allik, George Armelagos, Susan Ayers, Amanda Baumle, Janeen Baxter, Jess ben-Habib, Joao Biehl, David Blanchflower, Hans-Peter Blossfeld, Jason Boardman, Dorret Boomsma, Roel Bosker, Henry Brady, Martin Bulmer, Craig Calhoun, Miguel Centeno, William Cockerham, Mark Nathan Cohen, Amelie Constant, Simon Cottle, Connie Citro, Eileen Crimmons, James Curran, Scott Davies, Donatella Della Porta, George Downs, Francis Dodoo, David Dozois, Sonja Drobnick, Jaap Dronkers, John Dryzek, Riley Dunlap, Lauren Edelman, David Elesh, Paula England, Nancy Eisenberg, Geoffrey Evans, Miriam Faust, Robert Feenstra, Marcus Feldman, Stanley Feldman, Ronald Fischer, James Fowler, Jeremy Freese, Angela D. Friederici, Michael Frumpkin, Masahisa Fujita, Nicole M. Gage, Nancy Gallini, Rosemary Gartner, Morton Ann Gernsbacher, Robert Goodin, John Grattan, Lance Gravlee, David Greenberg, Wendy Griswold, Melanie Guldi, Monica Das Gupta, Peter Hatemi, Robert Haveman, Karen Heimer, John Hibbing, Sarah Blaffer Hrdy, Sheila Jasanoff, Kelly Kadera, Cigdem Kagitcibasi, David Kavanaugh, Roger Keil, Byungkook Kim, Rob Kitchin, Jack Knight, Lyle Konigsberg, Candace Kruttschnitt, Helen Ladd, Phillip Lane, Graeme Lang, Janet Lauritsen, Ashley Leeds, Evelyn Lehrer, Richard Lerner, David Lewis, Tim Liao, Tom Linneman, Norman Long, Karen Lyons, Ruth Mace, Gary Marks, Herbert Marsh, Karl-Ulrich Mayer, Lorraine Mazerolle, Rose McDermott, Susan Michie, Harry Minas, Peter Miller, S. Phillip Morgan, Victor Nee, Vin-Kim Nguyen, Paul Nieuwbeerta, Helga Nowotny, Howard Nusbaum, Claus Offe, Thomas Ollendick, Joan Orme, Dennis O'Rourke, Michael Overington, Catherine Panter-Brick, Susan Parnell, Deborah M. Pearsall, Gerard Pfann, Jon Pierre, Mike Ping, Jennifer Platt, Ken Prewitt, Cathy Price, Jill Quadnagno, Charles Ragin, Thilo Rehren, Ben Rosamond, Bo Rothstein, Beth Rubin, Heinrich Sauer, Peer Scheepers, Ralf Schwarzer, Moshe Semyonov, Michael Shanahan, Sara Shostak, Alan Sica, Rainer K. Silbereisen, Beth Simmons, Catalina Smulovitz, Michael Sobel, Diane Stone, Jill Stephenson, Rafe Stolzenberg, Miron Straf, Richard Swedberg, Alan C. Swedlund, Sidney Tarrow, Jacques-Francoise Thisse, Stefan Timmermans, Florencia Torche, Erik Tsang, Judy Treas, Billie Turner, Cees van der Eijk, Paul van Lange, James Vaupel, Karin Wahl-Jorgensen, Mitchell G. Weiss, Neil Whitehead, Pamela Wilcox, Bjorn Wittrock, Cornelia Woll, Gisele Yasmeen, and Barbie Zelizer.

Gratitude is owed as well to the many colleagues at Elsevier who contributed to the production of this volume. My first debt is to Claire Byrne, the project's Content Project Manager and the head of the Major Reference Works (MRW) team that managed the day-to-day *Sturm und Drang* of the project: aggrieved, confused, or delinquent authors, missed deadlines, testy and intransigent editors, and the often-maddening work style of the Editor in Chief. I am sure there were days when Claire wanted to tear her hair out, but to external appearances, she was an island of calm in a sea of turmoil. She was also exceptionally good at her job.

Claire's MRW team comprised Richard Berryman, Will Bowden-Green, Esmond Collins, Mark Harper, Sam Mahfoudh, Mike Nicholls, Gemma Tomalin, Joanne Williams, and Marise Willis. No matter what issue or problem I faced, one of these fine, capable people was always available to step up with a solution, invariably offered in a spirit of cooperation and good cheer. They have been to IESBS 2/e what tech support is to the modern computerized office. Getting this work completed without their help is inconceivable.

Thanks also to the succession of Elsevier's Acquisitions Editors who managed the finances and internal politics of the project: to Scott Bentley, whose gentle suasions pulled me into the project in the beginning; to Karen Maloney and Peter Labella who ran the show in the middle period; and to Lisa Tickner who was in charge at the very end. These are the people on the front line in the endless war between the publisher, who wants things done now and at minimal expense, and the Editor in Chief, who was always asking for more time and more money. The many dozens of amicable compromises necessary to bring the project to completion were all ably negotiated by Scott, Karen, Peter, and Lisa, and for that, I am grateful indeed.

The University of Central Florida and its Department of Sociology have provided a congenial home for the project. My thanks in particular to Dean Michael Johnson; to the current and former chairs of my department, Jana L. Jasinski and Libby Mustaine; to my faculty colleagues Liz Grauerholz, Phillip 'Hutch' Pollock, Bruce Wilson, Melanie Guldi, Stacy Barber, Tosha Dupras, and John Schultz; and to current and former graduate students Thomas Hall, Sara Strickhouser, Betsy Swart, Jordana Navarro, Marie Gualtieri, Shannon Simone, and Shannon Frey.

And most of all, my sincere thanks to the many thousands of authors whose work this is. When comparing the quality of the work contained within these pages to the authors' honoraria, it is obvious that IESBS 2/e is an act of collective charity by our authors to the disciplines they represent. It is my pleasure to thank our authors on behalf of the global social science community.

James D. Wright
Orlando, Florida

GUIDE TO USING THE ENCYCLOPEDIA

Structure of the Encyclopedia

The material in the Encyclopedia is arranged as a series of articles in alphabetical order.

There are four features to help you easily find the topic you are interested in an alphabetical contents list, cross-references to other relevant articles within each article, subject classification index, and a full subject index.

1. Alphabetical Contents List

The alphabetical contents list, which appears at the front of each volume, lists the articles in the order that they appear in that volume of the Encyclopedia. It includes both the volume number and the page number of each article.

2. Cross-references

All of the articles in the Encyclopedia have been cross-referenced. The cross-references, which appear at the end of an article as a See also list, serve three different functions:

a. To draw the reader's attention to related materials in other articles.
b. To indicate material that broadens and extends the scope of the article.
c. To indicate material that covers a topic in more depth.

3. Subject Classification Index

This index appears in Volume 26 and groups articles under subject headings that reflect the broad themes of Social and Behavioral Sciences. This index is useful for making quick connections between articles and locating the relevant article for a topic that is covered in more than one article. Under some section headings, you will find subheadings, if it is appropriate for the articles in a subject area to be grouped into more specific subareas.

4. Contributors

At the start of each volume, there is list of the authors who contributed to that volume.

5. Index

The index appears in Volume 26. The index includes page numbers for quick reference to the information you are looking for. The index articles differentiate between references to whole article, a part of an article, and a table or figure.

Abstract

Historical archaeology refers to the study of archaeological remains dating from 'modern' periods, usually within the last 500 years. This article outlines the major themes of historical archaeology, with particular attention to capitalism and colonialism. It discusses new theoretical developments, in particular the expansion of the field beyond North America and the Atlantic World, and greater engagement with social theory.

The term historical archaeology is somewhat of a misnomer for this field. Technically, historical archaeology could apply to any period for which historical documentation is available to supplement the material record studied by archaeologists. We might think of historical archaeology as more specifically the archaeology of the modern world (although modernity itself is a contested term). This period coincides roughly with the beginning of capitalism and European colonialism, with most historical archaeologists studying material remains, and the social relations to which they relate, from the late 1400s onward. Historical archaeology thus encounters some of the material with which we ourselves have some familiarity. The field itself was first broadly constituted in North America in the 1960s, and by the 1990s was firmly established with a focus on the major themes discussed here (Little, 1994).

Several key social, cultural, and economic issues are most commonly investigated through historical archaeology's broad framing of modernity (cf Funari et al., 1999). Capitalism has been, and continues to be, one of the central topics for historical archaeology. Our field studies the emergence of capitalism in Europe, the Americas, and elsewhere. This is often thought of in linear terms, with capitalist ways of life first being thought to emerge in England. Studies of household space and landscapes show that a process of enclosure began to commodify agrarian space, households increasingly began to differentiate work and domestic space, and food preparation and consumption began to separate (Johnson, 1996). Such changes have been argued to form a genealogy of later capitalist shifts in the United States, often framed as an eighteenth-century 'Georgian Order' in housing and other material culture (Deetz, 1996; Leone, 1984).

Historical archaeological studies of capitalism go far beyond economic shifts; fundamentally these studies are interested in the social changes associated with new ways of organizing labor and bodies, often concomitant with the rise of the individual (Shackel, 1993). Beyond British genealogies and the eighteenth-century Georgian Order, capitalism has been addressed in a range of different contexts. Plantations, for instance, have been central to wider debates as to the development of capitalist production (Mintz, 1985; Wolf, 1982). Studying the landscape of plantations, archaeologists have identified ways in which space was used to help create new means of viewing labor, in line with the development of particular technologies of labor that are seen to be tied up in capitalism (Delle, 1998). Other archaeologists have addressed capitalism through the world systems theory outlined by Immanuel Wallerstein (2000). Thus, the archaeology of Russian America can be studied as a part of a global system of capitalism, linking changes in material culture and oppression of native communities to wider worldwide economics (Crowell, 1997). Industrial archaeology – the study of factories and domestic spaces in industrialized locations – has also been a vital part of the study of capitalism. This involves the study of factories themselves, including their development as workplaces separated from the home with clear class hierarchies, and the concomitant growth of new domestic spaces for working class laborers and their families (Casella and Croucher, 2010; McGuire and Reckner, 2005; Mrozowski, 2000; Palmer, 2005; Symonds, 2005). This turn to industrialization is studied hand in hand with the general shift toward urbanization, and extensive studies of working class 'slums' have taken place in cities such as New York (Mayne and Murray, 2001).

The second central research topic of historical archaeology is the study of colonialism. This is often a corollary of developing capitalism, but is regularly separated out in analyses (cf Croucher and Weiss, 2011; Orser, 1996). The archaeology of Spanish colonialism forms one broad subfield, in locations such as Mexico (Rodríguez-Alegría, 2005), the Caribbean and Florida (Deagan, 1998), and California (Voss, 2008). The archaeology of British colonialism forms another significant subfield (Lawrence, 2003) and this includes locations as diverse as North America (Deetz, 1996), Australia (Paterson and Wilson, 2000), and South Africa (Klose and Malan, 2000). Beyond this, increasing attention is being paid to the archaeology of French colonialism, particularly in the Caribbean (Dawdy, 2008; Kelly and Hardy, 2011). Smaller pockets of study have addressed Dutch colonialism in South America (Hall, 2000; Schrire, 1995), Russian colonialism in the Americas (Lightfoot et al., 1998), and Omani colonialism in East Africa. Recent directions in this field, drawing on postcolonial theory, have turned from the study of colonizer to that of the colonized, placing increasing importance on the way in which indigenous cultures resisted colonial rule and continued to thrive, even as forms of material culture may seem to change. Such studies emphasize the ever-changing nature of indigenous societies, and the need to understand these as occupying the same temporal space – i.e., *not* that of the 'primitive' – as colonizers (Liebmann and Murphy, 2011; Silliman, 2009).

The study of these issues is addressed through varied forms of material culture. Historical archaeologists excavate, just as in any other field, and many studies are based on quantitative analysis of artifact patterns at different sites (e.g., Shackel, 1993). Other studies address landscape-based approaches, studying buildings or larger-scale landscapes to assess changing patterns through time (e.g., Delle, 1998). Alongside these sources, historical archaeologists always incorporate, to varying degrees, historical data. This field is by no means a 'handmaiden to history' (Noël Hume, 1964); instead, we are able to bring new insights to historical data through our integration of material perspectives. Oral historical interviews may also be undertaken in conjunction with archaeological excavation, and these may yield an interesting interplay between recollection and material facts (Whitehead and Casella, 2011).

The beginnings of historical archaeology were rooted in a search for a distinctly *American* past. Plantations in the Chesapeake have long, for instance, been a mainstay of historical archaeology. However, there has also always been diversity in the field, if nothing else, through the study of Spanish colonialism. But in the last few decades there has been significant growth in the idea of historical archaeology as a global field. At first this included the recognition that colonial South Africa had interesting comparisons with the U.S. (Falk, 1991), and the study of European colonialism in Australia, as mentioned above, has also figured into historical archaeology writ large. By the 1990s 'postmedieval' archaeologists in the United Kingdom (those archaeologists studying roughly the same period as US-based historical archaeologists) were beginning to engage in serious debate with U.S. scholars about the Atlantic World. But this period also witnessed the push for something that was more recognizably postcolonial in theoretical orientation, that is, some way in which historical archaeology outside of the Atlantic World, and areas which did not experience white settler colonialism, might also be addressed through the broader rubric of historical archaeology. One of the areas in which this development has been most notable has been sub-Saharan Africa (Croucher, 2014; Reid and Lane, 2004; Richard, 2013). This move has come with a call to incorporate postcolonial theory into historical archaeology, so that the dominant narrative is no longer that of a teleological expansion of European colonialism and capitalism throughout the world, and in which local voices come to be privileged in the determination of heritage (Shepherd, 2002; Stahl, 2009).

One of the central subfields of historical archaeology is the study of the African Diaspora. This began with the excavation of plantations in the U.S., and many studies have been written about the materiality of enslaved life in the Americas, demonstrating the rich social and cultural lives of these groups. For instance, on Jamaica, Mark Hauser (2008) has used locally produced ceramics as a means to trace participation in autonomous economic transactions by African Jamaicans. The deliberate deposition of artifacts, and artifacts associated with burials often shows the way in which enslaved and free black communities participated in ritual practices linked to African traditions (Armstrong and Fleishman, 2003; Davidson, 2010). Archaeological studies in the Americas, and now in East Africa, have also shown how self-emancipated communities built autonomous lives outside of bondage (Marshall, 2013). Studying free communities allows archaeologists to understand the way in which agency was expressed by African descendant individuals and groups, and shifts our present-day focus on the African Diaspora away from slavery. As such there has been a significant turn toward the study of free black communities in the U.S. in particular, with growing attention focused on the effects of systematic racism through the nineteenth and twentieth centuries (Leone et al., 2005; Mullins, 1999). Themes of social justice, racialization, and the study of those groups who may lack widespread historical recognition are also present in studies of wider immigrant groups in the U.S. This includes the study of Irish Americans in the industrial northeast and overseas Chinese in the West (Voss, 2005).

Feminist and gendered approaches to archaeology have been taken up widely within historical archaeology. Since much of the structure of gendered life today has been actively generated in the last few hundred years, historical archaeologists are able to trace the way in which material culture has been used to create and reinforce gender norms and identities. For instance, Diana Wall (1994) has shown that ceramics for various forms of dining in nineteenth-century New York City were related to the growing development of middle- and upper-class values in relation to the separation of the domestic sphere. Masculinities have also been studied in historical archaeology; Rodney Harrison (2002) has shown how impressive flaked glass tools, known as Kimberley spear points, were central to new ways of defining masculinity for Aboriginal men in late nineteenth- and early twentieth-century Australia. Sexuality has also begun to be integrated into historical archaeology, with a range of case studies showing the value of analyzing former brothel contexts to understand more about the lives of the women and men who formerly inhabited these sites (Seifert, 1991). Sexuality has been recognized as one of the ways through which colonial subjects were controlled. In eighteenth-century California, controlling indigenous and colonist women's sexuality was achieved through various spatial means, including the redesign of the Presidio in San Francisco (Voss, 2008). Critiques of mainstream feminist approaches have also been raised through drawing historical archaeology into conversation with black feminist theory (Battle-Baptiste, 2011; Franklin, 2001). These demonstrate the general lack of diversity within the field and have forced archaeologists to think about intersectionality, particularly as it pertains to African Diaspora archaeology.

The lack of diversity in historical archaeology is being addressed in part through a revisioning of some projects in relation to local communities. Following on from public pressure in cases with egregious mismanagement such as the African Burial Ground in New York City, historical archaeologists are beginning to recognize the importance of being led by communities as we engage in our research (La Roche et al., 1997). The nature of our field means that there are often communities who have some form of direct ties to the material that we work with. Listening to such groups and having an open and collaborative research process may mean that we come to produce work that holds much greater value to a public beyond our discipline, and that in the process also pays greater attention to the wealth of knowledge held in communities outside of traditional scholarly venues (Agbe-Davies, 2010; McDavid, 2002).

Historical archaeologists also have their eyes turned to the future, present, and very recent past. Forensic archaeology overlaps with historical archaeology in chronological terms, and historical archaeologists engage with the practice and theory of locating and identifying remains associated with war, mass killings, and other human rights violations of the last century (Crossland, 2000; González-Ruibal, 2008; *see* Conflict and War, Archaeology of: Behavior and Social Organization). Studies of contemporary material culture, practiced using the methodologies of historical archaeology, are also allowing archaeologists to analyze the materiality of contemporary phenomena. For example, Jason De León (2012) has studied the material traces of, and objects carried by, undocumented migrants crossing the U.S. border from Mexico. This shows the way in which migrants struggle to carry useful objects purchased with limited means. Such archaeological projects fuse the methodology of historical archaeology with ethnographic study to bring forward new insights that emerge when material culture is taken seriously. Interdisciplinarity – drawing on varied historical and ethnographic data – is the hallmark of historical archaeology. This field is by no means a handmaiden to history; historical archaeologists are focused on material culture, and thus are able to bring new insights into periods which may seem much more familiar than the traditional areas of archaeological study.

Historical Demography

Abstract

Historical demography was born as a separate discipline in historical science in the 1950s, when the concepts and techniques of modern demography were applied by French scholars to historical material. Its progress and achievements since then have changed our perceptions on, first, the Malthusian interpretations of premodern economy and society and, second, the onset of demographic transition that followed. The achievements of this discipline are assessed by conducting a survey of sources and methods, as well as of microbehavioral and macroaggregative research results on both topics. Then, attention turns to cross-Eurasian comparative studies of demographic and social structure.

Some of the central questions that historical demographers are concerned with may be traced back to the writings of the classical economist Thomas Robert Malthus. His influential thesis postulated that human beings are able to reproduce themselves 'in a geometrical ratio' while the capacity of the earth to produce subsistence increases 'only in an arithmetical ratio.' In the long run, therefore, population increase of the past must have been kept under control either by the 'positive check' of higher mortality or by the 'preventive check' of abstinence or late marriage. This theory exerted profound influence on our understanding of the nature of early-modern demography and the transition to its modern regime. However, it was not until the post-World War II period that historical demography was born as a separate discipline in historical science: in the 1950s, concepts and techniques of modern demography were applied by French scholars to historical material. Its progress and achievements since then have changed our perceptions on Malthusian and related questions.

A Social Science History

Historical demography is a social science history. It is distinguished from other branches of history by its explicit use of concepts and tools derived from a discipline in social sciences (in this case, demography). Its goal is to establish historical facts by applying such conceptual frameworks to historical sources, and its methodological novelty lies in quantification. The research results of historical demography as such have often questioned the conventional pictures of past populations, thereby raising doubts about the assumptions upon which many theories rest. The position of historical demography in the social and behavioral sciences thus resembles that of New Economic History, but it should be realized that there are a few notable differences in emphasis between these two social science history fields. While the application of theoretically constructed econometric models is given prime importance in New Economic History, emphasis in historical demography has always been on measurement. Attempts to formulate models to explain historical facts have never been put aside, but more effort has been directed to the development of finer measures and the identification of patterns, temporal, and cross-cultural, by using those quantitative measures.

Sources, Methods, and Impacts

Innovation in methodology often goes with the discovery of new data sources. In historical demography, too, its birth was closely tied with French scholars' application of the family reconstitution method, a form of nominal linkage, to registers of baptism, burial, and marriage kept in Christian parish churches. Parish register demography, as one may call this type of research, is an attempt to reconstruct a demographic profile of the past based on a set of family histories reconstituted according to the rules set out by the demographer Louis Henry, who turned to historical material to identify what he called 'natural fertility,' that is, fertility before the deliberate effort to reduce family size came to be practiced.

The kind of information that historical demography has supplied since then is the sort that it had always been thought would be available only from modern vital records or sample surveys. Thanks to laborious work by historical demographers, demographers are now able to describe past populations in much the same vocabulary as those of the present. However, there are a few drawbacks. In this kind of research, analysis ought to be restricted to persons whose burial dates are known, or who are known to have survived until their reproductive period was over. Since more people tended to leave the community with advancing age, it is very difficult to compute death probabilities across all the age groups, although a large enough sample, such as the one constructed by E. A. Wrigley and his associates at the Cambridge Group for the History of Population and Social Structure, does enable researchers to estimate age-specific patterns of mortality even from family reconstitution (Wrigley et al., 1997).

Furthermore, demographic research based on historical microdata has enabled researchers to work with 'cohort' measures. Most demographic concepts, such as life table and marital fertility, are designed to portray the life events of a group of people who were born or married in the same period (termed 'cohort'), but usually it is not possible for present-day demographers to single out people born in a particular period and to trace them to the moment they die. Instead of using

cohort measures, they have to rely on 'period' rates to account for demographic events in a specified period, in which the behavior of one cohort is bound to be mixed with that of other cohorts. In this sense, historical microdata have given demographers an opportunity to work with methodologically ideal populations.

For historians, on the other hand, historical demography has offered them a different set of merits. First, population becomes tractable as 'population change' and can now be decomposed into demographic components such as births, deaths, and migrations. This in turn enables historians to relate those demographic phenomena to changes in economic circumstances. For example, one of the results of the earliest family reconstitution studies in France showed us how changes in grain prices were correlated with those in births and deaths. Similarly, one can examine interrelationships between time series of demographic rates and real wages as exemplified in Wrigley and Schofield (1981).

Another impact of historical demography is being felt in social history. Since parish register demography reconstructs families and their life events that occurred in familial contexts, it has offered social historians invariable insights into the demographic domain of family life. Marriage, for example, is no longer a subject tied only with legal and ecclesiastical concerns. Who married whom, at what age, and with what age gap between spouses – all these questions can now be answered. In addition, information about prenuptial pregnancy, gender differentials in infant and child mortality, and other related topics can shed light on the intimacy of family life in the past.

Other related but somewhat different approaches have been adopted by another group of social historians. Statistical studies of the family and household, launched by Peter Laslett at the Cambridge Group in the 1960s, have been conducted in close association with research in parish register demography (Laslett and Wall, 1972). The research along this line strongly suggests that types of family system, whether or not a new household was formed on marriage, whether the presence of live-in servants in the household was frequent or not, the mean age at marriage, and the frequency of celibacy were all closely interrelated.

These links with social history have led to the burgeoning of family and household studies in history. Topics studied thus far include servanthood; gender inequality within the household; care for the elderly, widows, and orphans; and the succession of headship and property. There are also issues that have enabled historians to get further into the inner domain of the individual. Abortion, infanticide, child neglect, and other means of family limitation embedded in traditional reproductive culture are such issues.

However, the source material being used in historical demography and its related research fields is not confined to the parish registers. In fact, there is a serious drawback in the use of parish registers as a source. Since only people who registered baptism, marriage, and burial in a single community were recorded, it is impossible to reconstruct families who eventually left the community. It is also impossible to know how many people existed in that community at a particular point in time. All this implies that aggregative studies are extremely difficult to conduct, implying that the size of a settlement population, its birth and death rates, and in- and out-migration ratios can hardly be computed. Also difficult to conduct, for the reasons already mentioned, are mortality studies.

It is not surprising, therefore, that in many Western European countries other microdata are being used. Especially useful are listings of households and population, most of which were one-off 'censuses' taken for various purposes. Also, there are places where census-type records were regularly taken. In traditional Japan, for example, registers of village populations were compiled by officials every year, while in some parts of imperial China similar records were taken triennially. Such repetitive census-type data are useful not only for household analysis but also for demographic studies, since probabilities of entry or disappearance can be calculated at a regular interval. Since the early 1990s, these East Asian sources, together with similar data from three European populations in Belgium, Italy, and Sweden, have been intensively explored by an international team of scholars for the studies of mortality, fertility, and nuptiality in the past. This Eurasian collaborative work has so far produced volumes on mortality and fertility, reexamining the Malthusian paradigms with those individual-level data in different economic, institutional, and cultural contexts (Bengtsson et al., 2004; Tsuya et al., 2010).

Two Dimensions: Micro and Macro

Two broad areas of issues have been occupying a central place in the historiography of historical demography. One is the Malthusian models of positive and preventive checks and the other is the thesis of demographic transition. The former concerns premodern settings, while the latter is about the decline in fertility and mortality from high premodern rates to lower modern rates (for stages and patterns of the transition, see Chesmais, 1992). In both fields of research, however, it is useful to distinguish microbehavioral from macroaggregative dimensions.

Microdemography

As noted in this article, parish register demography was born as a fertility-oriented research field. Malthus's notion of the positive check posits the idea that overpopulation tended to be checked by a rise in mortality, which postulates that the reproductive behavior of couples was governed by the invariable 'passion between the sexes.' The classic theory of demographic transition assumes that pretransition populations placed 'strong pressure on their members to reproduce,' and hence that marital fertility was uncontrolled and its level close to the physiological maximum. Both Louis Henry, who coined the term 'natural fertility,' and Ansley Coale, who developed a technique to measure a deviation from the natural, uncontrolled fertility pattern in the course of his own project on the European fertility decline, assumed that if the couple has no target size of family and was not concerned by the existing number of children (termed 'parity'), marital fertility was not controlled and hence its level must be invariably high. In other words, the decision made by a couple to end childbearing (termed 'stopping') is assumed to mark the onset of fertility limitation. Much effort, therefore, has been made to measure

fertility levels and identify patterns by examining age, parity, birth interval, and other factors associated with individual couples' reproductive behavior (see Coale and Watkins, 1986).

However, according to a large body of empirical studies so far conducted, the original assumptions about reproductive behavior prior to the demographic transition are no longer tenable. First, pretransition of marital fertility was far more variable than previously imagined. Few populations exhibited levels comparable to that exemplified by the Hutterites, a small group of Anabaptist settlers in North America whose total marital fertility rate (TMFR, defined as the number of children a married woman would have within her reproductive period) stood as high as 11. In most cases, it was kept at moderate levels with a TMFR ranging from 6 to 9 and, as in East Asia, may well have been as low as 4–5.5 even if the 15–19-year-old age group is included in the reproductive period.

Second, it is confirmed that stopping behavior was never common among premodern populations. It should be noted, however, that some elite subpopulations, such as Catholic aristocrats in France and Italy and bourgeois families in Calvinist Geneva, exhibited a distinct stopping behavior, so that they can be regarded as forerunners of modern family limitation. Third, moreover, the couple's behavior to 'space' births at particular intervals, as contrasted with stopping, seems to have been more important in accounting for the moderate levels of marital fertility in traditional times. Unlike stopping, birth spacing could have been achieved either through deliberate means such as contraception or through unconscious actions such as breastfeeding, and many research results suggest that the role played by differences in feeding practices of the infant was unmistakable.

Fourth, it is now widely recognized that in many instances marital fertility was rising, rather than falling, in the period immediately prior to the onset of modern fertility decline. This was the case in some of the historic Eurasian populations as well as in twentieth-century developing countries (Dyson and Murphy, 1985; Knodel, 1988; Tsuya et al., 2010; Wrigley, 1998). One of the factors suggested as having affected this rising tendency is a reduction in the level of breastfeeding, which was often associated with early phases of urbanization. Another is an improvement in maternal health, which can be inferred by various measures such as the declining incidence of stillbirths. The latter is a promising area of microdemographic study, because even from family reconstitution, it is possible to investigate the interplay between fertility and mortality measures at very early phases of life.

The conclusion that pretransition fertility was not uncontrolled, whether consciously or unconsciously, demolishes the conventional divide between the modern and premodern regimes. Furthermore, findings from microdemographic data analysis have made it difficult to see the demographic transition in a dichotomous framework. To what extent the transition was a behavioral revolution still remains debatable.

Macrodemography

The concept of 'reproduction' can also be applied to a population as a whole. It means the way in which the population replaces itself through natural processes of birth and death. The overall level of such replacement may be indicated by the total number of children that an average woman will have during her childbearing period. This is called the total fertility rate (TFR). Since it does not take mortality into account, the population's natural process should be measured in terms of both fertility and mortality such as life expectancy at birth (e_0). Thus, one may describe historical populations by referring to the two, TFR and e_0. According to Livi-Bacci (2007), for example, Paleolithic populations and the Russians in 1879 happened to roughly exhibit the same level of TFR, a little fewer than 6.5 children per woman. But mortality was different. The life expectancy is supposed to have been below 20 years for the Paleolithic, whereas that for Russia was close to 30. As a result, the difference in the rate of natural increase was considerable. It was only marginally above zero in the Paleolithic case, whereas, more than 10 000 years later, the Russian population was growing at somewhat over 1% per annum.

This, however, should not be taken to imply that the driving force in population history was always mortality decline, with fertility remaining high throughout the long period before the modern age. Indeed, over time both fertility and mortality may have exhibited substantial volatility. Neolithic settlers are believed to have been characterized by fertility and mortality higher than those of Paleolithic hunters and gatherers, reflecting a combination of higher population density and sedentism among the farming populations (Bocquet-Appel, 2011). A much more recent case in point is England from 1550 to 1800. Wrigley and Schofield (1981) have documented that from the late sixteenth century, when England's rate of natural increase stood at below 1% per annum, the country's TFR and e_0 simultaneously declined toward the late seventeenth century. From that period to the second half of the eighteenth century, the two measures came back to a position of higher fertility and higher life expectancy again. This time, however, the speed of rise in fertility exceeded that in life expectancy, so the country's population grew faster than 1% per annum.

Since information from family reconstitution studies does not add up to macro, aggregate measures, complex and sophisticated estimation techniques, such as back projection, are needed to reconstruct the history of a past population at large. Judging from a few well-grounded back projection works such as Wrigley and Schofield (1981), first, there is now agreement that the role of nuptiality should be stressed in accounting for how overall fertility changed in pretransition Western Europe. The age at marriage was instrumental in adjusting the actual level of fertility in relation to changing economic circumstances. This is what the classic Malthusian model of the preventive check predicted, thus suggesting that such a homeostatic mechanism was at work in the long- to medium-run time frame of the Western European past.

Second, this does not imply that mortality crises were not important. Short-term fluctuations in mortality were frequent in various regions in Europe, most of which were subsistence crises occasioned by crop failure. The demographic effects of famine are well known. The incidence not only takes a heavy death toll but also reduces fertility (Dyson and Ó Gráda, 2002). The frequency of famines, therefore, can account for much of the fluctuation in human population. However, the famine mortality was particularly high when accompanied by an outbreak of infectious disease, and it is the changing levels of 'exposure' to viruses and other microorganisms that acted as

a major determinant to mortality over the long run. And such exposure was in many cases not directly related to humans' economic conditions but had more to do with cross-cultural encounters of populations, each of which tended to function as a distinct disease pool. The supposed link between mortality and the general standard of material life, therefore, was less direct than often imagined.

This suggests that the overall relationship between economy and population growth was rather weak. It is true that during the period of fertility decline, neither nuptiality nor mortality could offset the declining trend of marital fertility and, hence, the corresponding rise in population. This, however, should not be taken to imply that economic growth, which accompanied this demographic transition in most cases, changed the whole relationship between the demographic variables a 'demographic regime' (Wilson and Airey, 1999). Neither industrialization nor urbanization was the crucial determinant of the onset of fertility decline. Even the modern decline of mortality was not in close association with an increase in the general standard of living.

Finally, mention must be made to the role of migration. The basic demographic equation tells us that a population will change according to the addition of births and immigrants, and the subtraction of deaths and emigrants. In other words, without information about in- and out-migration, it is impossible to account for any macrochange. Migration, therefore, is as important a topic as nuptiality, fertility, and mortality in historical demography.

Unfortunately, however, as historical sources rarely recorded actual population movements, not much has been done on this important topic. The historiography reveals that the volumes of in- and out-migration, distance, and pull-and-push mechanisms are issues relatively better covered thus far. Much less known is the demographic impact of such migration flows. Were death probabilities in areas that migrants headed for different from those in their native communities? Was their marriage and reproductive behavior altered by their geographical mobility? Or was even their parents' demographic decision making affected by the prospect that their children would eventually leave for a place of, presumably, better opportunities? It is only in cases where no effect of these was substantial that we do not need to know anything other than the rate of net migration (immigrants minus emigrants), which tended to be rather small. More specifically, any interpretation of results from family reconstitution studies rests upon the assumption that 'leavers' would behave just as 'stayers' did. All the demographic measures derived from this method relate only to the population of stayers (i.e., those born locally who continued to live in their native community). The mean age at marriage, for example, could have differed between these two populations. Although it turns out that the difference was minimal in the case of English family reconstitution, the possible effects of migration on marriage as well as the other demographic variables can be determined only empirically (Wrigley et al., 1997, Ch. 5).

One of the few findings we have in this regard is about rural-to-urban migration. In a traditional setting, the urban population was distinguished by a greater exposure to diseases and, hence, higher mortality than in the countryside. Obviously, even in such a mortality-dominant urban demography, the marriage market may also have been affected by the size of in-migration as well as that of labor demand. Moreover, the rural sector should not be considered demographically homogeneous. There are European case studies suggesting that 'proto-industrial' villages exhibited an earlier age at marriage and higher fertility rates than farming villages. To what extent this was universal is debatable. What is certain, however, is that the destination and volume of each migration stream between the rural and urban sectors could affect the overall rate of population change in a preindustrial setting.

The picture becomes less clear for the period of modern fertility transition, which in many cases coincided with extremely large volumes of migration streams, both long- and short-distance movements. It is probably safe to suppose that rural-to-urban migration in this period also meant deterioration in the disease environment, while transoceanic migration to land-abundant settlements led to a lower age at marriage and higher fertility. What is less clear is its influence on the population sending those migrants in the course of change. In the literature on demographic transition, migration, especially townward migration, tends to be regarded as having facilitated the decline of fertility. On the other hand, it is often noted that rural populations did not readily respond to changing economic and social circumstances by lowering their fertility. One suggested reason why it was still beneficial for peasant families to keep their fertility relatively high is the expanding prospects for the younger generation: when it was felt that they could emigrate and form their own households elsewhere, stayers' immediate need for the limitation of fertility may have been reduced.

The Demographic Landscape in Cross-Cultural Perspective

At a more generalized level, historical demographers have developed a notion of a homeostatic demographic regime. Many societies in the past had an ability to maintain equilibrium between their resources and the demographic characteristics; it is the ability to restore the original state of equilibrium, even if an external shock forces the system away from that position. When the ways in which this homeostasis is achieved are similar for a group of populations, it is probably appropriate to call that particular mode of interrelationships between the demographic variables a 'demographic regime.' Given empirical evidence so far accumulated, therefore, we may see the traditional Western European populations as characterized by a particular mode of demographic regime. In this regime, both fertility and mortality levels were relatively low, and the key to its adjusting mechanism was nuptiality acting to ensure the system would restore equilibrium.

Turning to the nuptiality patterns, John Hajnal in his influential articles has shown that in traditional Europe, west of the line from St. Petersburg to Trieste, the mean age at marriage was relatively high and celibacy not negligible, and that all this was closely tied with the nuclear family system and its associated principle of neolocalism. In contrast, non-European countries exhibited comparatively low ages at marriage and very low proportions never married, suggesting that different demographic regimes were operating in other parts of the world (Hajnal, 1965, 1983).

Take China and Japan. According to in-depth regional studies in traditional periods, the level of life expectancy at birth (e_0) in northern China was probably in the early 1930s, while it stood at 39 in central Japan (for China, see Bengtsson et al., 2004, Ch. 10; for Japan, see Liu et al., 2001, Ch. 7). Compared with the Western European average, China's mortality was on the high side and Japan's was on the low side. On the other hand, as noted in this article, TMFRs in both countries were low by Western European standards.

The Chinese and Japanese results raise some interesting questions. First, it is clear that the much lower level of marital fertility did not reflect stopping behavior, but spacing, thus confirming much of what the work on Europe has suggested. What is not certain at this stage is whether the observed long birth interval was a mere reflection of low fecundity, or a product of deliberate actions. While the factors accounting for the former vary from breastfeeding to malnutrition, the latter raises further questions: to what extent abortion, infanticide, and child neglect were practiced; which of the three was most responsible; and whether it was motivated by despair or guided by the notion of 'planning,' however rudimentary it would have been.

Second, the East Asian nuptiality pattern was undoubtedly different from that of Western Europe. There was no neolocal principle working. Nor was the age at marriage functioning so as to adjust overall fertility to economic conditions. Within East Asia, while China and Japan seem to have shared the characteristics of universal marriage, the female mean age at marriage was unmistakably higher in Japan than in China.

Third, however, if attention is turned to the status of females and family systems, we realize that there were some fundamental differences between China and Japan. For example, while no particular anomalies are observed from Japanese sex-specific life tables, the Chinese studies point out that parents in northern China are likely to have used infanticide on girls (Bengtsson et al., 2004), and according to an analysis of the relationship between changes in remarriage and death rates, females' remarriage among Chinese was more restricted than among Japanese. Clearly the status of girls and women was very different in traditional Chinese society. More specifically, it is the family system that differed. Predominant in Japan was the stem family system, under which the family household was vertically structured, and customs such as adoption, marriage, and remarriage were all for the family line to perpetuate. In China, on the other hand, what operated were the rules of joint family. Under that system, the household was laterally structured and the composition tended to be perennially complex.

Finally, all this suggests that Hajnal's dichotomous framework for marriage and family formation systems should be expanded to accommodate a third type (i.e., the stem family system), which will go some way toward a better understanding of cross-cultural differences in marriage and fertility behavior and in social structure of the past as well as the present (Saito, 2005).

To conclude, historical demography as it now stands is both social science oriented and interdisciplinary. It has questioned the Malthusian interpretations of early-modern economy and society and the processes of the demographic transition. Recently, moreover, it has shed new light on cross-Eurasian comparisons in demographic and social structure.

Historical Explanation, Theories of: Philosophical Aspects

Abstract

There have been three distinct ways of approaching the explanation of historical events: metahistorical, prescriptive, and descriptive. Metahistorians explain events as being driven by some grand overarching pattern of historical change. The best known are Enlightenment theories of progress toward greater freedom and rationality, and classical theories of the cyclical growth and decay of civilizations. Prescriptive theories state how historical events should be explained: causal, hermeneutic, structural, and narrative models have been proposed. Descriptive theories, on the other hand, analyze forms of explanations commonly found in history books. Arguments to the best explanation are commonly used to infer what happened in the past. Causal and rational explanations commonly explain why significant events and actions occurred. Finally, postmodern theories of language, culture, and narrative have driven some writers to skepticism about descriptions and explanations of the past. I suggest that such skepticism is not warranted.

There are three fairly distinct kinds of theory about the nature of historical explanations. First, there are reflections upon accounts people have given of basic processes of historical change that determine the general direction of history. These accounts are what J.-F. Lyotard calls 'the grand narratives' or 'metanarratives' of history. In Western culture, these have generally been theories of historical progress and theories of cyclical change. Such theories have been proposed by theologians, political theorists, and philosophers, but seldom by professional historians, who are understandably wary of generalizations of such immense scope. In recent years, both the truth and the point of such explanatory theories have been queried, and as a result such theories of world history are now seldom produced. Some historians still offer quite general explanatory interpretations of national and international history, but these too are often held to be partial, in both senses. For convenience, historical explanations of this first kind will be referred to as 'general interpretations of historical change.' The closest thing to a theory about such explanations is the discussion by J.-F. Lyotard, so his writing will be used as a platform for some remarks about them.

Second, there are four carefully articulated theories of how historians should explain events. These are written by philosophers rather than historians. Some think historical explanations should be scientific, employing general laws. Some declare that history is not a scientific but a hermeneutic discipline looking for the meaning of events rather than their causes. A few favor comprehensive, many-layered structural history, noting how basic geographic and social structures influence historical change. Finally, there are those who, in a postmodern vein, see history as no more than a form of literature, with historical events acquiring meaning from their place in a discourse. The philosophers who promote these theories of historical explanation would say they are describing historical practice, but in fact they are much less interested in analyzing historical practice than in promoting a form of explanation that they think is very important in understanding history. For that reason these will be called 'prescriptive theories of historical explanation.'

The third kind of theory of historical explanation is a theory that claims to be descriptive and analytic, focusing on historical practice to discover the variety of historical explanations historians actually produce and their criteria of acceptability. The task of this theory is to provide clear analysis of typical historical explanations, pointing out the logical standards that it seems they aim to satisfy. The two most common kinds of explanation produced by historians are explanations of the origins of physical artifacts, such as documents, paintings, coins, and buildings, to discover what happened in the past, and explanations of past actions and events to discover why they occurred. To discover what happened in the past, historians often employ a form of argument known as an argument to the best explanation. On the other hand, explanations of why people acted as they did, and why major events occurred, frequently identify reasons and other causes of actions and events that made their occurrence probable, or more probable than an envisaged alternative.

The article will briefly describe each of these theories of historical explanation, and make one or two comments upon them. It will conclude by drawing attention to the skepticism of some recent philosophers of history about the truth of historical descriptions and the correctness of historical explanations.

General Interpretations of Historical Change

In the culture of Western Europe, there have been several grand theories of historical change. Christianity, more particularly the Bible, brought with it a theory of progress in history, of God establishing his kingdom on earth, first through his prophets, then through the Israelites, through Jesus, and finally through the Church, until Christ returns in triumph. St. Augustine presented an immensely influential version of this story in *The City of God*. With the progress in science achieved by the application of reason in the seventeenth and eighteenth centuries, a secular theory of historical progress was created by Kant, Condorcet, and others, who saw reason and the methods of science driving human progress toward ever-increasing, this-worldly happiness. Hegel and Marx described the process of human progress as dialectical, contradictions being overcome by new stages of development, either in the advancement of reason, freedom, and self-consciousness in the case of Hegel or in autonomy and prosperity, in the case of Marx. The optimism implicit in all these theories of progress was largely shattered by

 http://dx.doi.org/10.1016/B978-0-08-097086-8.63087-8

the experiences of the twentieth century, of hideous world wars, of vast economic depression, of rampant infectious diseases, and of tyranny, greed, and madness defeating enlightenment in so many countries. As Lyotard puts it, Auschwitz invalidates the Hegelian assumption that the real is rational; Budapest 1956 invalidates the Marxist claim that what is communist is proletarian (Lyotard, 1987, p. 162).

A few writers have argued that progress has indeed continued throughout the twentieth century. With the defeat of fascism and the disintegration of Soviet communism, F. Fukuyama sees the emergence of liberal democratic capitalism as the final stage of historical development, *The End of History*. He says that it best satisfies the two driving forces in history, the desire for material prosperity and the desire for personal recognition. Tyrannies had to go, as tyrants showed no respect for the common people. In democracies everyone has a say, or at least a vote. It seems obvious, however, that if the vote is not enough to ensure the recognition and respect people desire, then history has not ended after all.

Lyotard has three main objections to the grand theories of historical progress mentioned above. The first has already been stated: all are contradicted by the horrors of the twentieth century. Second, Lyotard objects that these theories have constrained historical writing in an unacceptable way. Under the influence of such theories, historians have written particular histories as instances of the theory of progress they most favored. For example, they depicted political revolutions as steps toward political freedom, and scientific revolutions as evidence of the growth of reason. In this way, Lyotard finds metanarratives oppressive, and prefers that people should write their narrative stories as they like (Lyotard, 1984).

Finally, Lyotard says that "all great historical upheavals" such as the French Revolution "are formless and figureless in historical human nature" (Lyotard, 1987, p. 174). The enthusiasm such an upheaval generates is sublime, he says, and incapable of true representation, although we like to suppose that all who participated were motivated by a desire for greater freedom. All that historians can truly describe, according to Lyotard, are individual human actions and responses, 'little narratives' of particular events.

A few comments on Lyotard's ideas seem called for. First, he is right to deny inevitable progress toward a more rational, free, self-conscious, prosperous, and autonomous society. Theories of progress all underestimate the desire and ability of powerful people to exploit others for their own gain. More realistic, it seems, are some cyclical theories of historical change. Aristotle and Polybius produced such theories, which were revived during the Renaissance in the writing of Louis Le Roy and Jean Bodin in France, and of Machiavelli and later Vico in Italy. In Aristotle, they found a doctrine of the natural succession of political structures from monarchy to aristocracy to democracy and back to monarchy again, each stage established to resolve injustices that had arisen in the previous one. From Polybius they came to see cycles in the growth, flourishing, and decay of states, some attributing decay to states overextending themselves, others seeing it as a result of moral failure among its leaders. However, as Bodin said, the causes of a state's collapse can be varied, including military conquest by its enemies (1965, p. 59). There is no general theory of historical change that is true without exception. Cyclical theories were popularized in the twentieth century by Manuel Spengler's (1926–1928) *The Decline of the West* and Toynbee's (1951–1961) *A Study of History*.

Second, while metahistories may have been used to legitimate certain accounts of particular historical events, to the exclusion of others, some generalizations about the motivation for political revolutions and other events seem in order. The leaders of the French Revolution and the pamphlet writers who supported them did legitimate their attack on the monarchy by an appeal to reason, liberty, and human rights. Of course there were other, more self-interested motives at work as well, but that is not to deny the legitimation given to the revolutionary movement by these ideas. Rather than dismiss generalizations about the motives for revolutions and other large-scale events as all mistaken, historians should take care to qualify them so that they are fairly accurate. Generalizations are useful ways of summing up individual stories and describing social movements.

Finally, one of the chief objections to metahistorical explanations of historical change is something that Lyotard does not mention. They frequently assume that a whole series of events were all justified by the same ideals, when in fact this is false. For example, many political events and revolutions have been justified in the name of liberty and human rights, but the ideas of liberty and human rights were not always the same in every case. The rights and liberties sought in the English Revolution, the French Revolution, and the Russian Revolution, for example, differed significantly. Therefore, it is misleading to suggest that they were all legitimated by the same ideals.

This typically historicist objection to metahistory is important, but not entirely decisive. While different particular rights and liberties were sought at different times and places, all can still be called rights and liberties. Indeed, all drew upon traditions of thought about human reason and dignity found in classical and biblical writing, which were applied to the particular situations. It is wrong to suggest that these events all had precisely the same legitimation, but it is also wrong to deny that the values they appealed to were quite unrelated.

Prescriptive Theories of Historical Explanation

In the last section, we considered some philosophical responses to theories of historical change, which is to theories that identified certain more or less constant sources of historical developments. These theories provided substantive explanations of history. We now turn to theories of historical explanation of quite a different kind. These are theories about the logical structure of explanations of historical events. They are not theories about what produces historical change but theories about how historians should explain what has happened in the past. These theories are prescriptive, describing how their authors think historical events should be explained. There are in fact many forms of explanation commonly used by historians, but these theories focus upon just those that their authors judge, for different reasons, to be the most important.

Theories of Scientific Explanation

In the nineteenth century, both John Stuart Mill and the historian Henry Thomas Buckle argued that historians should try to explain historical events as scientists do, by discovering

the laws of society that governed their occurrence. With these laws, the occurrence of historical events could be deduced, given certain antecedent conditions, just as the occurrence of natural events can be deduced from the laws of nature.

When K.R. Popper came to propose a theory of historical explanation, he quoted Mill's theory with approval, but thought it could be made more precise. "I suggest," he wrote, "that to give a causal explanation of a certain *specific event* means deducing a statement describing this event from two kinds of premises: from some *universal laws*, and from some singular or specific statements which we may call the *specific initial conditions*" (Popper, 1961, p. 122). Popper went on to point out that the laws used by historians are familiar, everyday ones of no particular interest. He opposed those historicists who believe there are general laws of historical development, and he opposed those who claim that historical events are unique, and so have nothing general about them whatever. Those who present general laws of history, such as the Marxist theory that all history is of class struggle, are really offering interpretations, Popper said, describing those changes in history that interest them.

The philosopher who most clearly and forcefully presented a deductive model of historical explanation was C.G. Hempel, in his article 'The Function of General Laws in History.' Drawing upon the tradition of Mill, Popper, and others, he produced the following analysis: The explanation of an event of some specific kind *E*

consists of

1. *a set of statements asserting the occurrence of certain events* $C_1 \ldots C_n$ *at certain times and places,*
2. *a set of universal hypotheses, such that*
   a. *the statements of both groups are reasonably well confirmed by empirical evidence,*
   b. *from the two groups of statements the sentence asserting the occurrence of event E can be logically deduced.*
   (Hempel, 1965, p. 232)

The letters *C* and *E* are intended to suggest cause and effect. The aim of historical explanations, he wrote, is that of "showing that the event in question was not 'a matter of chance,' but was to be expected in view of certain antecedent or simultaneous conditions" (Hempel, 1965, p. 235). He admitted that the relevant laws are often difficult to formulate precisely, and that often the consequence of the initial conditions occurs only with a degree of probability (Hempel, 1965, p. 237). Consequently, he called the explanations offered in history incomplete 'explanation sketches' (Hempel, 1965, p. 238).

Hempel's formulation of the deductive theory of explanation was subject to much discussion and criticism. The main objections were as follows:

1. The model does not state conditions sufficient to produce a good explanation,
   a. because sometimes events that enable one to predict an outcome are not the events that caused it. For instance, from a sudden fall in a barometer one can predict a storm, but that event does not explain the occurrence of the storm, because the fall in the barometer was not necessary for the storm's occurrence.
   b. Furthermore, for an explanation to be satisfactory, it must describe the kinds of causes that are of interest to the reader. If a man with a gastric ulcer is suffering from stomach pain after eating parsnips, a doctor would attribute the pain to his gastric ulcer, whereas his wife would attribute it to his eating parsnips. For the doctor, eating parsnips is normal, but having an ulcer is not, whereas the wife is familiar with the man's ulcer and picks out his eating parsnips as the event that made the difference. This objection assumes that the function of causal explanations is to explain a contrast between a given event and another expected, normal event, rather than to show why an event was predictable.
2. The model does not state conditions necessary for a good explanation,
   a. because often all that is required to explain an event is to show that the event was more probable than a contrasting state, which might not be very probable at all. Consider the question 'Why was the monarchy replaced by a republic in France in 1792?' This question could be asking, why was there a change in constitution and not just a change of government, why was the republic set up in 1792 and not earlier, and why was the establishment of a republic in France more likely than any other kind of constitution, such as a limited monarchy of the sort that resulted from the English Revolution?
   b. Furthermore, many explanations in history are not intended to show that an event was very probable, or that it was more probable than a contrasting state. For instance, historians often want to know the reasons why people behaved as they did, reasons that may or may not have made their actions very probable.

There is some merit in Hempel's theory that historical explanations are meant to show events to have been very probable. Admittedly, some explanations have different aims. Certainly, causal explanations must refer to events that were necessary for the occurrence of the event being explained. Nevertheless, some causal explanations are not contrastive but are meant to explain what brought about a certain event by pointing out events and circumstances that made its occurrence very probable. However, this can very seldom be done by citing a single law relating cause and effect. Normally, historical events are the product of several tendencies at work in a situation and are explained as an outcome of those. Historians try to make the outcome appear as highly probable as possible, but often that is not very probable, just more probable than anything else in the circumstances.

Theories of Hermeneutic Explanation: Explaining the Meaning of Actions

While G. Vico and J.G. von Herder had written of the importance of understanding human cultures as complex, almost organic units, the theory of hermeneutic understanding, in opposition to scientific understanding, was first fully applied to history by W. Dilthey. The theory had its origin in the lectures on hermeneutics by F. Schleiermacher, whose biography Dilthey published early in his career (in 1871). Following Schleiermacher, Dilthey said that the way to understand human actions is by using empathy to imagine the experiences and thoughts that moved people to act as they did. We interpret

what people do and say, he said, by drawing upon our own experiences of life to imagine what was going on in their minds to make them produce the expression that is being interpreted. After he had developed this psychological theory of understanding, Dilthey became interested in the meaning human actions have in furthering the aims of the social or cultural structures to which they contribute. He wrote:

> *To start with, the parts of a life have a meaning according to their relation to that life, its values and purposes, and according to the place they occupy in it. Furthermore, historical events become significant through being links in a system of interactions in which they co-operate with other parts to bring about values and purposes in the whole.* (Dilthey, 1961, p. 148)

The structures he mentions as being "the simplest and most homogeneous" are "education, economic life, law, politics, religions, social life, art, philosophy, science" (Dilthey, 1961, p. 146). These different structures often express similar values and beliefs and so are interconnected. These common ideas can create a common tendency in a particular culture for an age. People are constantly improving the structure and effectiveness of these organizations, and their actions can be interpreted as having such historical significance.

The main objection to Dilthey's theory of historical understanding was clearly stated, and addressed, by Gadamer in *Truth and Method* (1986). Dilthey had said that we understand other people's actions on the basis of our general knowledge of life in the world. Gadamer pointed out that often the historian's world is remote from the world of the people being studied. Dilthey, he said, "took no account whatsoever of the historical nature of experience" (Gadamer, 1986, p. 212). Heidegger explained that understanding things is not something we do after we have apprehended them, but rather it is what we do in apprehending them, in reading a text, or in recognizing a machine. Our interpretation of things is a function of our own historical nature (Gadamer, 1986, pp. 230–2): "that we study history only insofar as we are ourselves 'historical' means that the historicalness of human There-being [*Dasein*] in its expectancy and its forgetting is the condition of our being able to represent the past" (Gadamer, 1986, p. 232). Our understanding of what things mean is first of all provided by the traditions in which we have been raised (Gadamer, 1986, p. 250).

Once the historicity of historical understanding is fully understood, the question of the objectivity of history becomes quite urgent. Is there any sense in which one's understanding of the past could be called 'objective'? Gadamer has a couple of things to say about this. First, he insists upon coherence as a condition of correct understanding: "The movement of understanding is constantly from the whole to the part and back to the whole. Our task is to extend in concentric circles the unity of the understood meaning. The harmony of all the details with the whole is the criterion of correct understanding" (Gadamer, 1986, p. 259). He remarks that when it is difficult to find a coherent interpretation, we suspect that we are dealing with a world whose patterns of meaning we do not really understand. This leads to his second important point. Gadamer employs the concept of a 'horizon,' which he describes as "the range of vision that includes everything that can be seen from a particular vantage point" (Gadamer, 1986, p. 269). Historians occupy a particular vantage point in the history of the tradition that formed them. To understand a past event, they must do so from the point of view of those involved. They can find that historical horizon because they have learned of it from within their own tradition. Then when historians come to report their understanding of the past, they do so in terms of their present worldview. Gadamer explains, "In the process of understanding there takes place a real fusing of horizons, which means that as the historical horizon is projected, it is simultaneously removed" (Gadamer, 1986, p. 273). It is but a short step from Gadamer's account of historical understanding to postmodern theories, which describe history as a cultural construct, usually in narrative form, having no particular relation to the real events of the past whatever.

At the same time as German philosophers were reacting to attempts to make historical explanations scientific by developing theories of meaning, British philosophers were pointing out that historical explanations are typically accounts of the reasons for which people acted as they did. R.G. Collingwood wrote as follows:

> *For science, the event is discovered by perceiving it, and the further search for its cause is conducted by assigning it to its class and determining the relation between that class and others. For history, the object to be discovered is not the mere event, but the thought expressed in it. To discover that thought is already to understand it. After the historian has ascertained the facts, there is no further process of inquiring into their causes. When he knows what happened, he already knows why it happened.* (Collingwood, 1961, p. 214)

Collingwood said that knowledge of past minds is arrived at by drawing inferences from observable facts, more particularly by forming and testing hypotheses about what people had in mind when acting as they did.

Collingwood's attack on scientific models of explanation and espousal of rational explanations was given fresh expression by W.H. Dray in his first book *Laws and Explanation in History* (1957). He criticized the 'covering-law models' of Popper and Hempel and developed an account of rational explanation that was less idealistic and more logical than Collingwood's. He said that in deciding reasons for actions, historians relied on general knowledge of the form "When in a situation of type $C_1 \ldots C_n$ the thing to do is x" (Dray, 1957, p. 132). Such statements, he said, were 'principles of action,' which are universally known and respected. They explain actions by showing that the action was the rational thing to have done in the circumstances.

Today, we would give more respect to Collingwood's account of explanation than to this early statement of Dray's, because people's reasons for acting are not always universally appropriate. Indeed, even from the agent's point of view, they are sometimes not very rational at all. All that matters when explaining the reasons for an action is that they were the reasons for which the agent acted.

Hempel responded to Dray by arguing that reasons only explain actions if we know that people holding such reasons were likely to act on them (Hempel, 1963). According to Dray, historical explanations should show that actions were reasonable responses to a situation. Hempel said they must

always show that the action was to be expected in the circumstances. I think reasons can cause actions by inclining people to perform them, but they do not always make the actions appear either very rational or predictable.

Theories of Structural Explanation in History

There are two distinct kinds of structural explanations in history, both closely associated with the work of the French Annales School in the twentieth century.

Braudel's Structural Theory

The first kind of structural explanation is most famously exemplified by F. Braudel's large history, *The Mediterranean and the Mediterranean World in the Age of Philip II* (1972b). In it, Braudel explains the geographic and social structures in which observable actions occurred, and how those structures limited or promoted certain possibilities. He wrote:

> *when I think of the individual, I am always inclined to see him imprisoned within a destiny in which he himself has little hand, fixed in a landscape in which the infinite perspectives of the long term stretch into the distance both behind him and before. In historical analysis as I see it, rightly or wrongly, the long run always wins in the end … it indubitably limits both the freedom of the individual and even the role of chance.* (Braudel, 1972b, p. 1244)

The constraints that Braudel had in mind were largely geographical and technological, but he included frameworks of belief as well (see Braudel, 1972a, p. 18).

Braudel showed how geography and technology limited agricultural production and trade, and so the growth of wealth in the sixteenth century. The size of populations, and their vulnerability to famine and disease, also played a part. In addition to these slowly changing structures of geography and technology, Braudel also described cycles of economic and social change that occurred more frequently. These constituted processes of change within economic, social, and institutional structures that historians could model and describe in a theoretical way. He provided a careful analysis of the cycles of mercantile capitalism between the fourteenth and eighteenth centuries, which formed the background for the history of Philip II in the sixteenth century. As Braudel showed, these structures limited the possibilities of human action, as well as making the effects of certain events very probable. However, Braudel gave no systematic account of the relation between these two kinds of structures and the actions of individuals, which constituted the third level of historical description he identified.

Structures of Meaning

The second kind of structural explanation favored by historians of the Annales School, such as Lucien Febvre, Marc Bloch, and more recently by Emmanuel Le Roy Ladurie and many others, is one that explains the meaning of an utterance, a gesture, or a symbol by referring to a structure of meanings, a language, of which it is a part. Dilthey had anticipated this theory of meaning in some of his later writings, although he is best known for relating meaning to intention. This French structuralist theory of explanation emerged from work by Saussure in linguistics and Lévi-Strauss in anthropology, which explained the meaning of one part of a language by referring to other parts to which it was systematically related. Historians found such patterns of meaning in social events. As Jonathan Culler has put it

> *The cultural meaning of any particular act or object is determined by a whole system of constitutive rules [such as rules of a marriage ceremony or of football]—rules which do not so much regulate behaviour as create the possibility of particular forms of behaviour make it possible to marry, to score a goal, to write a poem, to be impolite. It is in this sense that a culture is composed of a set of symbolic systems.* (Culler, 1973, p. 22)

People are seldom aware of the rules governing the symbols they use, any more than they are aware of the rules of language, but the rules can be discovered by historians and anthropologists studying their behavior. The rules can be implicit or explicit. Historians prefer to study the explicit rules governing behavior, usually found in the discourse by which it is described, because then the meaning given to the behavior is truly historical, and not something merely inferred by the historians.

Theories of Narrative Explanation

Once historical explanations were thought to display the meaning of historical events, rather than just describe their causes, the way was open to view historical narratives as forms of explanation. This is precisely what Hayden White did in his seminal book *Metahistory* (1973). In the theoretical introduction to that book, White describes 'explanation by emplotment,' 'explanation by formal argument,' and 'explanation by ideological implication.' An historical event that is merely listed in a chronicle, he said, has no particular meaning or significance. However, once it is located in a story, it is given both meaning and significance, by being related to what preceded and followed it. Following Northrop Frye, White identified four forms of emplotment: romance, tragedy, comedy, and satire, each with its characteristic structure. Thus, for example, "Romance is fundamentally a drama of self-identification symbolised by the hero's transcendence of the world of experience, his victory over it, and his final liberation from it" (White, 1973, p. 8). As well as telling stories of different kinds, he said, historians also describe the relations between events in the past in several different ways. Following Stephen C. Pepper, he identified four kinds of 'argument' about the nature of historical events. The formist depicts them as unique, the organicist sees particular events as parts of a whole, the mechanist presents events as instances of general laws at work in history, and the contextualist describes events as products of tendencies at work in their environment. Finally, narratives can represent certain ideological views of historical change and give events meaning by locating them within one of those. Following Karl Mannheim, White picks out four such ideologies: that of the conservatives, who see history as the evolution of existing structures; the liberals, who think that reason and goodwill will eventually see that certain ideals are attained; the radicals, who think utopian conditions should be achieved by revolutionary means; and

finally the Anarchists, who believe that an ideal state will be achieved by destroying existing structures and leaving people free to act on their own humanity. White found 'affinities' between these three groups of four. For example, he said romantic plots often employed a formist presentation of events, and embodied an anarchist ideology.

White correctly points out that explanations of these kinds can be viewed as interpretations. Interpretations are one of several more or less equally well-justified accounts of a subject, which give meaning and significance to its parts. White did not consider whether one interpretation could be better than another, but F.R. Ankersmit did in his book *Narrative Logic* (1983, Chap. 8), in which he declared that narrative interpretations should aim for maximum scope, not only in the number of events they describe but also in the number they illuminate. This seems to be on the right track.

Descriptive Theories of Historical Explanation

Hayden White denied that his analysis of historical explanation was exhaustive, but it was far less prescriptive than previous theories, indicating a large range of ways in which historians could account for events in the past. An avowedly descriptive, analytic approach to historical explanations is that provided by McCullagh in *The Truth of History* (1998) and *The Logic of History* (2004). McCullagh analyzes forms of explanation common in historical writing to discover both their structure and their conditions of acceptability.

Historical inquiry usually begins with the collection of documents considered relevant to a topic of interest about people's behavior in the past. One way of drawing inferences about the past from present evidence is by judging the best explanation of that evidence. To choose between the possible explanations, scholars refer to the several criteria for judging the best explanation (see McCullagh, 1984, Ch. 2). For example, the four gospels in the New Testament of the Bible describe appearances of Jesus to his disciples as one who was alive, even though he had died. That is a topic of interest to Christians, and some have studied the significance of the gospels' accounts of the resurrection appearances very carefully (e.g., Craig (2008), Ch. 8 and Licona (2010)). Historians consider several different explanations of the gospels' reports of Jesus' appearances to his disciples after his crucifixion, trying to decide what really happened. One possible explanation is that Jesus' body was stolen from the tomb and the disciples experienced hallucinations of his risen body; another is that the reports are really myths designed to support the faith of the disciples and others in Jesus' divinity; and the third is that God raised Jesus from the dead and he appeared to the disciples, which is what Christians believe. The Christian hypothesis neatly explains the experiences of the disciples reported in the gospels, and their subsequent confident declarations that Jesus had risen from the dead in the book of Acts, so it has impressive explanatory scope and power. However, it is implausible, because it is a law of nature that after two days dead bodies do not live again, and the Christian hypothesis is ad hoc, because without any supporting evidence it declares that God raised Jesus, to avoid the problem of its natural implausibility. Having said that, however, the alternative explanations of reports of Jesus' appearances are not very convincing either: mass hallucinations are very improbable, and if the resurrection reports were a myth, it is unlikely that the disciples would have proclaimed them so vigorously, at some cost to themselves (for instance, Stephen was killed for saying that Jesus lived, and was the promised Messiah). (For a more detailed consideration of the arguments, see McCullagh (2012)).

Arguments to the best explanation are designed to consider the credibility of hypotheses about unknown causes of present data. Once historians have amassed information about a topic in history, they go on to offer explanations of events they judge to have been significant. This requires them to identify circumstances and events that were contingently necessary and jointly sufficient to have made the occurrence of their chosen events probable. They might want to know all the important causes of the events, or just the more important, or the conditions that made the events that occurred more probable than others that might have been expected in the circumstances. The events they explain are often actions. To explain these, historians often refer to the beliefs, values, and intentions of the agents; their interests, instincts, and concerns; and the rules of their culture and the expectations of their society. (See McCullagh, 2004, Ch. 4.) Sometimes, historians explain events that are described, not as actions, but as changes in a social structure: for instance, the defeat of an army, the collapse of a bank, and an increase in tribal hostility. Historians employ generalizations about common causes of such events to identify the particular causes at work in particular cases. Often these generalizations refer to tendencies or dispositions for such events to occur when triggered by events of a certain kind. For instance, tribal conflict within a state is likely to increase after the removal of a central government that previously suppressed it. Sometimes an event is caused, not by another event so much as by prevailing conditions. For instance, if one army is much weaker than another, then in a conflict between them, the first army is likely to be defeated. All these generalizations have been learned from historical experience.

When philosophers of history write about explanations, they usually have causal explanations or narrative explanations in mind. Historians can provide other kinds of explanation as well. They can explain what happened in the course of a certain event, how a certain change from one state to another occurred, what the structure of a certain institution or society was, as well as why an event occurred. The adequacy of such explanations is judged by deciding how adequately they answer the questions they are addressing. The questions provide both the logical and conceptual parameters of the required explanation.

The Challenge of Postmodern Theory

Historians have traditionally assumed that the conclusions they draw about the past from present evidence are very often true, even though it is logically possible for the conclusions of the inductive arguments they use to be false. They have also assumed that their causal explanations of past events are generally correct.

Over the last few decades, however, these assumptions about the truth of historical descriptions and the correctness of causal explanations have been challenged. This skepticism can be attributed to three streams of philosophical discussion. The first, attributed in the first place to F. de Saussure's analysis of language, is often called 'the linguistic turn' or 'the semiotic turn' (Spiegel, 2005, Introduction). Saussure said that the meaning of words is explained, not by their relation to things in the world but by their relation to one another. Some concluded that the world we believe in is really nothing but a linguistic construction, a product of our particular language, having no particular relationship to the world at all. The second source of postmodern skepticism is from the work of anthropologists like C. Geertz, who noted how the world seems different to people of different cultures and concluded that the world we believe in is simply a construction of our particular culture. In fact our understanding of the causes of events is not always the same as that of people in other cultures. Even within our own culture, our understanding of the causes of natural and social events changes from time to time with changes in scientific and social theories. The third discussion to promote skepticism about the truth of history has been among philosophers of history themselves, starting with H. White's *Metahistory*, which drew attention to the way historical narratives are structured (see Section Theories of Narrative Explanation above), and implied that their structure is determined, not by past events, but by the historians' preferences. The most strenuous argument for skepticism about the truth of history, drawing upon these and other sources, is A. Munslow's *The Future of History*. He is convinced that we cannot prove history true, and says that we should judge histories by their emotional, moral, or aesthetic value.

A thorough reply to the skeptics would take us too far afield. Suffice it to say that our descriptions of the world have truth conditions, and we are justified in believing them to be true when we know the kinds of experiences we would expect to have if they were true. We may believe that descriptions of the world are true if the kind of experiences they imply have indeed been experienced. Languages and cultures differ, but sentences describing the world in each language and culture have truth conditions, and can be judged true or false depending upon whether the experiences they imply have been experienced. To overcome skepticism about our knowledge of the world and of the past, we must investigate the relations between language and experience more fully than the skeptics I have mentioned. In addition, with particular regard to history, we must study the arguments by which historians defend their descriptions and explanations, to see whether they warrant belief in their conclusions. (See McCullagh, 1984, 1998, and 2004, which attempt to do just that.)

Abstract

Historical geography stems from efforts to incorporate historical research at the regional scale on landscape change and past geographies into geography. The scope of this early work is outlined, but while such matters continue to be important in historical geography research, the field of study now embraces many other research foci. Studies of capitalism and its transformative effects; research on environmental change and human–environment relations; and work interpreting the meanings of historical landscapes and landscape change are three other main constitutive areas of study. However, the field is rapidly expanding around new themes, such as postcolonial reinterpretations of the history of empires, historical geographies of the colonized world, the connections between identity formation and the spaces and places of nationalism, ethnicity, and gender. These and other new themes are outlined, and the point is made that historical geography is now a broad interdisciplinary field of inquiry and not a narrowly defined subdiscipline of geography. This is a cause of some adjustment within geography, and the concerns of historical geographers for their endeavor are discussed.

Historical geographers aim to incorporate historical research into geography by examining past geographies, landscape change and the meanings of landscapes, capitalism and its transformative effects on economies and societies, urbanization and demographic change, as well as environmental change and human–environment relations. Consequently the field of historical geography is dynamic with many new themes, such as the history of mobility, travel writing, postcolonial reinterpretations of the history of empires, historical geographies of the colonized world, the connections between identity formation and the spaces and places of nationalism, ethnicity, and gender, emerging in recent years. These and other new themes are outlined below. Historical geography is now a broad interdisciplinary field of inquiry and not a narrowly defined subdiscipline of geography. This is a cause of some adjustment within geography.

Setting a Place for History within Geography

Despite earlier antecedents, modern historical geography really stems from the late nineteenth century, and particularly the work of French geographers, notably Paul Vidal de la Blache, on regional landscape formation, and of the German school of *Anthropogeographie*. Offshoots from these beginnings were established in Britain and the USA, and by the 1920s historical geography seemed poised to play the same preeminent role in human geography as geomorphology had in physical geography. During the mid-twentieth century, however, geography tended to emphasize spatial relationships within a regional geography approach and, in this context, historical geographers struggled to assert historical methodologies and research questions within the discipline. Historical geographers like Derwent Whittlesey in the USA and H.C. Darby in the UK focused on landscape change and process, and each cultivated the core practice of researching past geographies using forms of cross-sectional analysis. In parallel with the pattern of explanation in geomorphology current before 1950, Derwent Whittlesey organized his research around a series of reconstructions of past geographies. Detailed reconstructions of past geographies became associated with the work of many historical geographers, including H.C. Such analysis paralleled patterns of explanation in geomorphology at the time, but focused on cultural landscapes rather than physical ones. Their reconstructions of past geographies highlighted change over time but the explanatory power of this 'sequent occupance' or reconstruction approach remained at best weak. Nevertheless, detailed reconstructions of past geographies remain an important tool in historical geography, as is illustrated in many historical atlases published toward the end of the twentieth century. In Los Angeles, Carl Sauer researched the diffusion of cultural objects and practices, and the study of cultural landscapes. Borrowing from German geography as well as biology and anthropology, he supervised many PhD students and, although a pioneer of cultural geography, did much to pave the way for historical explanation in geography.

The generation of historical geographers emerging after World War II confronted new challenges. As the quantitative revolution swept through geography, they wrestled with whether history was needed in geography if geography is spatial science? As the Cold War shaped universities and societies, they were confronted with political issues: can historical explanation be informed by Marxism? Some new centers of historical geography research emerged, and notably at the University of Wisconsin, Madison, where the Canadian Andrew Hill Clark fostered research on regions, economies, and cities within North America. In the UK, Alan Baker at Cambridge University and Robin Butlin at Leeds were leading figures in a growing subdiscipline. Some of the postwar generation of historical geographers harnessed diffusion theory for research into disease and epidemiology. In Britain, E.A. Wrigley pioneered demographic history. Others drew their explanatory models from settlement, agriculture, economic, and urbanization studies, but generally they advanced explanation through careful reconstructions using archival data. Growing numbers of historical geographers met in both regional and national

associations and in an internationalizing but loosely organized conference, now known as the International Conference of Historical Geographers (ICHG). The establishment of the *Journal of Historical Geography* in 1975 signaled the consolidation of the subdiscipline.

Human geography in general began to embrace and discuss historical explanation in new ways in the 1980s and 1990s. Spurred on by debates in the social sciences and history over historical materialism and structuralism, and by feminist theory and phenomenology, many human geographers looked for alternatives to positivist social science. In 1990, David Harvey confidently argued that analysis of the production of space, the geographical imagination, and the historical geography of concepts of space and time were central to any critical enquiry into the contemporary world. He pushed for both a critical historical geography of capitalist transformations of the world and a critical inquiry into the ways in which geographers framed time, change, and development. Simultaneously, Brian Harley had challenged conventional histories of cartography, and mapping practices within historical geography, by drawing out the ways in which cartography had been structured to serve various state purposes. Cultural geographer Dennis Cosgrove interrogated the concept of landscape in its historical European uses and found similar issues with geographers' studies of landscape change. In this context, the Canadian historical geographer Cole Harris argued for geography as a project of regional-historical synthesis, and against the growth of spatial science at the expense of humanistic geographies. As these and other geographers called for critical inquiry into the subjectivities of geography and their histories, it seemed that historical geography would be central to a human geography that was moving beyond positivist framings of knowledge.

Historical geographers drew inspiration from a wide range of social theory, and humanistic and feminist approaches. They researched diverse archival sources and wrestled with how these could be interpreted and what it meant to work in the archives. They brought new concepts, frames of reference, subjectivities, questions and topics as well as new quantitative methods, cartographic technologies, and forms of textual and visual analysis to their desks, as they pursued alternative forms of historical explanation. However, the distinctive approaches that emerged cut across earlier framings of historical geography as a subdiscipline of geography organized around inquiries into regional and landscape change and the analysis of past geographies, even as such research reached a high point of sophistication. The result has been prolific growth of historical geography but around many divergent and entangled research themes.

Regional Historical Geography

Regional historical geographies remain vital within the subdiscipline. In North America, Donald Meinig and the many students of Andrew Clark were very active over several decades in research and commentary in and around this approach. Their projects emphasized the dilemmas of (re)settlement and human–environment relations, and both drew on and contributed to theory and debates in economic, agricultural, and urban history. Perhaps their efforts reached an apogee with the publication of Donald Meinig's four volume work *The Shaping of America* (1998–2004), Carville Earle's *Geographical Inquiry and American Historical Problems* (1992), Cole Harris' *The Resettlement of British Columbia* (1998), and the *Historical Atlas of Canada* (1987–93) published in three volumes. As the reference to the historical atlas of Canada should make clear, thematic mapping has an important role in this research. North American regional historical geographers have contributed two key organizing ideas: the geographical personality of particular regions, and the formation of culture areas. This regional or area studies approach was not confined to rural landscape change, but included important work on the appropriation of 'new' lands through colonialism, on urban systems, and on industry. Nor was it confined to North America or to 'national' projects: historical geographers have written on an array of regions and areas. Generally theirs are synthetic works that draw together research on diverse phenomena and at many scales. Such research is now of considerable interest to those historians who are rescaling their research either to global, world, empire, regional, or even microscales.

Capitalist Transformation

The historical geography of capitalism and its transformative effects through history are a second main area of research, one which now constitutes a more substantial body of work than the regional studies stream but intersects with it. How capital works and acts to construct and destroy specific landscapes, work rules, economies, and social identities is a central area of inquiry. But capital is not conceived as the only actor, and attention is directed to the everyday life worlds, responses, resistances, and life chances of those living in a transforming, modernizing world. As a result, historical geographers working in this stream research diverse topics. In the UK, Derek Gregory and John Langton published monographs on regional transformations during the English industrial revolution, while M. Overton remapped the agrarian transformation in England. In Montreal, Sheri Olson and Pat Thorndon led research into a wide range of urban experiences of the industrial city, and identified the adaptive strategies and experiences of individuals in demographic and household economy terms and by class, ethnicity, gender, age, and family status. Alan Pred contributed complex situated montages of the spaces and experiences of world's fairs and dock work. Robert Lewis analyses the remaking of North America's metropolitan industrial spaces while I have applied network theory from economic geography to reinterpret the geographies of agricultural machinery production. Richard Harris unmasked North American suburban development processes and experiences, in the process challenging the Chicago School models on factual grounds. Richard Dennis surveyed English industrial cities, and researches the new urbanism emerging in the nineteenth century as a result of new apartment buildings and new forms of mobility. The construction of new spaces of consumption and segregated ethnic residential neighborhoods, and the contestation of public space have been other important areas for historical geographic research, but there is a fantastic array of related studies. For example, Mona

Domosh has interrogated understandings of New York's department stores by considering them in the contexts of the emergence of consumption districts and from the perspective of a gendered streetscape. In *The Ride to Modernity* (2001), economic geographer Glen Norcliffe explored Canadians' peculiar encounter with the bicycle and its spatial ramifications and social meanings as one of the first mass-produced consumer luxuries. At Berkeley, Richard Walker has scrutinized capitalist framings and constructions of nature. Historical geographers working in this broad research area have developed synergies and alliances with economic geographers, social and urban historians, demographers, labor, economic and business historians, and cultural geographers. Their research has not only broken with long-held historical narratives summarizing spatial processes under industrial capitalism, but has also challenged representations of the significance of present-day reconfigurations of urban and economic space.

Environmental Transformations

Environmental transformations and human–environment relations comprise a third area of research within historical geography. There are ancient scholarly works on these subjects and modern scholars included Alexander von Humboldt, George Perkins Marsh, Vidal de la Blache, and Élisée Reclus, so this is a research area with an illustrious pedigree in geography. In addition, as Alan Baker declared, these roots of a historical geography of human–environment relations are entangled with those of historical ecology as practiced in anthropology and biogeography. So Pierre Gourou's ground-breaking research into laterization in tropical environments is also part of this legacy. Midway through the twentieth century, *Man's Role in Changing the Face of the Earth* (1956), an encyclopedic survey on the subject edited by William Thomas, drew together an interdisciplinary who is who of the field. This feat was echoed in 1990 with another edited volume *The Earth as Transformed by Human Action*. These themes remain important foci for research within historical geography which continues to feature work reconstructing past natural environments and researching human impact on natural environments. Here historical geographers like Donald Meinig, who worked out the historical environmental limits of the American Great Plains and the South Australian wheat belt, J.M. Powell, who evaluated water management in Victoria, Australia, Eric Pawson, writing on New Zealand's environmental history, Craig Colten, whose *An Unnatural Metropolis* (2005), studied hazard and vulnerability in New Orleans, and Michael Williams, Graeme Wynn, and Michael Roche, who each wrote on forest (mis) management, have made substantive contributions. While some physical geographers, like Stanley Trimble and Andrew Goudie, who penned an introduction to the subject that has served the purpose for a long time now, have contributed to the research area, and one of the most read special issues of *The Journal of Historical Geography* focused on the history of climate change discourse, there is considerable scope for further involvement.

These efforts of historical geographers are now entangled with those of environmental historians such as Donald Worster, Richard White, Alfred Crosby, William Cronon, Caroline Merchant, Richard Grove, Christian Pfister, Christof Mauch, Frank Uekotter, John McNeil, David Nye, and Theodore Steinberg. Environmental history sprouted in the USA but has now been set to work in many lands. Its practitioners have tended to embrace environmentalist values and to write critically of past human interactions with environments. Their research projects are pitched at diverse scales from global patterns of species diffusion to local studies of dams and wetlands. They write histories of global, urban and marine environments, animals, green politics and environmental movements, perceptions of the environment, and science networks related to environmental knowledge. There is considerable traffic in the ideas and practices between them and the historical geographers researching environmental transformations and human–environment relations, and there are multiple entangled strands of research in this thriving field of interdisciplinary research.

Landscape Change

Landscape interpretation and change is a further key theme for historical geographers, but the foundational work in this theme came from cultural and, to a more limited extent, physical geographers rather than historical geographers. The physical geographer W.G. Hoskins (who published *The Making of the English Landscape* in 1955), and the cultural geographers J.B. Jackson (founding editor of the American journal *Landscape*) and Carl Sauer, were major mid-twentieth century figures writing to understand the making of national and regional landscapes. Their interests have been taken up inside cultural geography in the subsequent works of Wilbur Zelinsky, Pierce Lewis, Fred Kniffen, Yi-Fu Tuan, and by historical geographers Michael Conzen, Derek Holdsworth, and many others in North America, and of Della Hooke, Hugh Prince, and others in the UK. This tradition emphasizes landscape design, environmental awareness, and their manifestation in, especially, vernacular landscapes. The subject matter ranges from urban and suburban streetscapes, through public and religious buildings and monuments, factories, office towers and banks, to backyards, public gardens, cemeteries, and national parks. Particular attention has been paid to non-Western landscape design as, for example, in Hong-key Yoon's publications on geomancy. Historical geographers share their interests in these topics with professionals in cultural geography, anthropology, archeology, architectural history, folk studies, and museum studies.

Cultural–Historical Geography

The emergence in the 1980s of a new cultural geography transformed writing in historical geography on the meanings of landscape. By asserting that landscapes are material objects that manifest many discourses the new cultural geography fostered a burgeoning, critical literature on the meanings of landscape. This literature, heralded by Denis Cosgrove and Stephen Daniels' edited collection *The Iconography of Landscape* (1988), emphasizes symbolic landscape representation in the past, the

power relations manifest in such representations, and their work in forming identity, memory, and heritage. Attention has turned to many forms of landscape representation that were not the main foci for earlier research including landscape painting, travel writing, literature, money, and exhibitions. Cultural geographers like Denis Cosgrove, Stephen Daniels, Brian Osborne, James Duncan, Jeanne Kay Guelke, Pyrs Gruffudd, Emily Gilbert, Mona Domosh, Veronica della Dora, and Suzanne Seymour have studied past representational systems. There are new historical geographies of the present which analyze the use of aids to memory and nostalgia as active forces in today's landscapes. Among others, Nuala Johnson and Brian Graham have paid particular attention to landscapes of memory and heritage landscapes. As is increasingly the case, there are connections between scholars working on this theme and those working on other themes: here Don Mitchell's *The Lie of the Land: Migrant Workers and the California Landscape* (1996) can serve as an illustrative example.

Indeed, there is now common usage of the term 'cultural-historical geography' to capture a style of critical geographical research that uses historical studies and cultural theory to research not only landscape but also imperialism, colonialism, the environmental consequences of colonialism, and the history of geographical and environmental thought. Whether this term can capture the thrust of the emerging research enterprise is less certain. The roles of geographers in past imperialism, cartography, land survey, and orientalism are properly the subjects of critical enquiry. Historical geographers are interrogating imperialism as part of postcolonial reinterpretations and critiques of the history of empires and are writing historical geographies of the colonized world. Thus, the spaces, networks, exhibitions, maps, and landscapes of European empires and their settler colonists are being researched, for example, in the works of Felix Driver, David Gilbert, Stephen Legg, Alan Lester, Cole Harris, Brenda Yeoh, Mike Heffernan, and Kay Anderson. Tracing their entry point to Edward Said's *Orientalism* and the works of Michel Foucault, critical geographers like Derek Gregory and Joanne Sharp are investigating the representational systems and framings of geopolitical discourses, including the impacts of the Cold War on North American social science, which Matthew Farish explored in *The Contours of America's Cold War* (2010), and the geographies of the War on Terror, which Derek Gregory maps in *The Colonial Present* (2004). In their work, American imperialism is in focus.

National Styles

Different contexts have inflected specific 'national' foci for historical geography research, and this means that it is problematic to read off the content of historical geography from trends in the UK and USA alone. In New Zealand and Australia, historical geography has long been identified with research into environmental management, land use change, colonial land alienation and resettlement, and now with interpretation of colonial cultural landscapes. By contrast, in Canada, urban, industrial, and cultural landscape foci are each equally as important as environmental history or colonialism. In Japan, pre-nineteenth century geographies have been a main focus of interest but there is new research emerging on more recent periods, especially Japan's engagement with modernity and imperialism. In both Singapore and Israel, historical geographers have been directly confronting the colonial and post-colonial policies that have shaped their countries. There is a long-established and growing community of historical geographers in China. In Germany and Eastern Europe, environmental and land use change has emerged as the mainspring of historical geography, but in each case, it is problematic to make more than these cursory comments, since the field is in flux and 'national' styles of historical geography are inherently problematic. There is considerable networking across national borders as witnessed, among other things, by the history of the ICHG. The ICHG began life in 1975 with a meeting of British and Canadian historical geographers in Kingston, Canada, expanded to become an Australian, British, Canadian, New Zealand, and US conference, and, in 1986, at the Baton Rouge meeting, changed its name to the ICHG to reflect its international character. The most recent meetings were held in Kyoto in 2009 and Prague in 2012, and the next conference is scheduled for London in 2015.

Fluid Historical Geographies

There are many other themes that could be profitably included in this review but a full account of historical geography's tangled web is really beyond the scope of this paper. Historical geographies of identity probe the connections between nationalism, trans-nationalism, ethnicity, identity, globalization, and place. Geography, as a scientific and educational practice, has a historiography that is being critically reviewed. There are collaborative projects in GIS and remote sensing to recreate and reinterpret past geographies. Capturing historical cadastral, topographical, and other map and aerial photo data in a GIS has enormous potential to enhance analysis of landscape and environmental change. While Japanese historical geographers use cadastral maps of ancient Japan to assess recent earthquake damage, Anne Knowles has been remapping aspects of the holocaust, and British collaborations locate William Wordsworth as he penned his poems in the Lake District. Brian Graham and Catherine Nash identified interest in the study of modernity, but even the title of their reader, *Modern Historical Geographies* (2000), asserts an array of approaches, concepts, and perspectives. Attention continues to be directed to many different eras. Historical geographers write from many perspectives, pursue an array of approaches, and connect with different themes during their individual careers.

Fluidity is also true of the institutional frameworks for historical geography. As governments transform their research funding opportunities, geographical research is increasingly organized in research groups and teams, and the institutional contexts for historical geography morph. As individual geography departments refocus their programs, there is often no room for a dedicated 'historical geographer' and few such positions are advertised but it is also expected that geographers of all kinds will be historically informed and inquiring. This means that many departments are homes to excellent historical geographic research but that this is seldom organized under the framework of a department of geography with a chair in

the historical geography of a particular region. Colleagues appointed in GIS, physical, cultural, economic, social, or urban geography turn their attentions to historical problems and research. Some historians are housed in geography departments and there is also movement the other way. In these changed circumstances, knowledge of regional geographies and histories, the historical geography of capitalism, environmental transformations, human–environment relations, past landscapes, archival resources, and historical research methods remain crucial to much research.

Historical Geography in Review

The ways in which historical geographers conceive of their field of study have changed considerably over the last 50 years. Contrasting three reviews of historical geography illustrates the point. In his 1962 classification, H.C. Darby framed historical geography as a subdiscipline of geography which comprised research into geographies of the past, changing landscapes, the role of the past in the present, and the role of geographical factors and explanations in historical research, or geographical history. This latter term has been used in different ways within debates over the scope and content of historical geography. It was used either as a synonym for historical geography or as a descriptor of the special case of the use of geographic factors to explain historical phenomenon. US historical geographer Carville Earle argued for a revised historical geography, one that focused on geographical explanation of historical problems. Darby's seemingly programmatic statement reflected the struggles within mid-twentieth century geography and has been criticized from many quarters in subsequent years. Nevertheless, his review was meant to open a general field of inquiry rather than to constrain research.

When defining historical geography for *The Dictionary of Human Geography* (2000), Daniel Clayton declared that "geographical work on the past has become eclectic and no new orthodoxy for historical geography is likely to emerge." Such work was self-consciously interdisciplinary or without disciplinary label. Clayton left the impression that 'historical geography' was a label attached to a modernist project of academic disciplines and one with diminishing purchase as critiques of the foundational narratives of modernity intensified. For Clayton, the enduring legacy of the subdiscipline was its flagship *Journal of Historical Geography*, which he saw as a valuable arena for research and debate.

By contrast, in his *Geography and History* (2003), Alan Baker acknowledged no *old* orthodoxy for historical geography and instead identified three general approaches within a broad interdisciplinary field of historical geography – locational geographies and histories, environmental histories and geographies, landscape studies – and a fourth, integrative approach that emphasized region and area. He argued that regional geographies and histories have a claim to be at the center of historical geographic research because they are integrative in an explicitly geographic way, and might draw from any of the other three approaches. Baker was at pains to highlight "the diversity, the coherence and the relevance of historical geography" and "to reconcile some of the oppositions perceived within it and also between historical geography and history." While he unabashedly sought to discern order in the development of historical geography, he welcomed experiment, dialog, and encounter and denied that there ever was a narrowly defined historical geography concerned only with the reconstruction of past geographies and their changes over time.

Historical geography is, as ever, fluid. There are discernible trajectories but just how these are evaluated depends a great deal upon your point of view. Many historical geographers express concern over the prospects for their subdiscipline and discipline, but their concern seldom arises from any sense of seeing their subject area 'invaded' by other interest groups. Instead, they often express the belief that critical geographers represent historical geography as stuck in positivist, cross-sectional, and regional practices while ignoring most of the substantive research in the field, and contend that, because other interesting and productive foci have emerged and present challenging and inspirational findings, there is now too little attention to region, urban system, ecosystem, or water shed in (historical) geographic research. They perceive a danger that the sweep of regional and systems change will be missed and historical explanation eschewed.

At the same time many historical geographers interpret the same developments by celebrating the continued growth and expansion of a dynamic field of interdisciplinary research with many new and interesting concepts, theories, and frameworks for research. Historical geographers are in dialog with historians of all kinds, economic, social, and cultural geographers, geographical information scientists, even physical geographers. Theorizing space, place, landscape, maps, populations, cities, and environment is increasingly important in history. This is seen in the many collaborative projects and teams of researchers that have emerged in environmental history, urban history, social science history, history of cartography, landscape and cultural studies, and historical demography. For example, some recent works in New Zealand history, such as Eric Pawson and Tom Brooking's *Environmental Histories of New Zealand* (2002) and *Seeds of Empire* (2011), or Barbara Brookes, Anne Cooper, and Robin Law's *Sites of Gender* (2003), feature teams of geographers, historians, and social scientists. Indeed, the authors publishing in the pages of *The Journal of Historical Geography* have increasingly diverse backgrounds. Within geography time, memory, and the past have proved to be of continuing interest as geographers seek to research uneven development in space just as the world seems more intimately wired and networked than ever before. In each and every thematic subdiscipline, geographers need to develop relevant historical geographies.

Historical geography is currently expanding as critical geographical work on the past proliferates. The subdiscipline's borders are open and bridges across the 'divide' with history are multiplying. Historical geography, more eclectic and more experimental than ever before, is increasingly a site for interdisciplinary research as social scientists and historians try to establish which aspects of the twenty-first century world are new and how they are significant. Simultaneously, institutional support for the subdiscipline has narrowed as geography departments favor thematic specializations, albeit with historical research interests. This situation could be read as a sign of the long-term success of

historical geography: it has helped to establish a permanent place for history within geography.

Historical Linguistics: Numerical Methods

Sheila M Embleton, York University, Toronto, ON, Canada

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Numerical methods in historical linguistics strive to determine how closely two languages are related. Pairwise, this can be used to reconstruct a tree for a language family (lexicostatistics). More ambitious methods assign dates to splits within trees (glottochronology). The methods have been extended to distant relationships, often to try to answer whether the languages involved are related at all. All methods, no matter how sophisticated, rest on the simplest observation: since languages change over time, originally related languages gradually become less similar. This enables inferences about diachrony from synchronic information only, attractive when little is known about history. Methodological difficulties come in quantifying rates of change, measuring difference, and accounting for factors interfering with normal change processes (e.g., mutual influence between languages). The attractions of numerical methods are the same as in any humanities discipline: speed, objectivity, replicability, and ability to handle large volumes of data efficiently.

Introduction

The main goal of numerical methods in historical linguistics has always been to answer the question of how closely two languages are related. Applied pairwise to languages, this can be used to reconstruct a tree for a whole language family (lexicostatistics). More ambitious methods have additionally assigned dates to the splits within those trees (glottochronology). The questions and methods have been extended to involve distant (hence controversial) relationships between languages, so the basic question becomes not just how closely two languages are related, but whether they are related at all. All methods in this area, no matter how sophisticated, rest on the simplest of observations: since languages change over time, two originally related languages gradually become less similar over time. This enables the linguist to infer something about diachrony from synchronic information only, particularly attractive in situations where little is known about the history. The methodological difficulties come in quantifying rates of change, measuring difference, and accounting for the myriad of factors that can interfere with the so-called normal change processes (e.g., mutual influence between languages). The attractions of numerical methods in historical linguistics are the same as those attributed to quantitative methods in almost any discipline in the humanities or social sciences: speed, objectivity, replicability, and ability to handle large volumes of data efficiently.

Early Methods

The earliest precursor to a numerical method in historical linguistics is a statement made by Robert Gordon Latham (1850: p. 565, see also Hewes in Hymes, 1960: p. 338): "the average rate at which languages change is capable of being approximated" and "the maximum difference, at a given period, between two or more languages is also capable of being approximated". He never pursued this, and the next milestone in the development of numerical methods in historical linguistics was a statement by Sapir (1916: p. 76): "The greater the degree of linguistic differentiation within a stock the greater is the period of time that must be assumed for the development of such differentiation". Sapir's influence on later linguists was great, so even though he himself never followed this statement up by taking the basic steps of quantifying linguistic differentiation or rate of change, this can be seen as the genesis of the most widely known numerical method in historical linguistics, that of Swadesh (1950, and see below).

The first explicit numerical treatment of genetic proximity of languages was that of Kroeber and Chrétien (1937), following a method created by two anthropologists, Jan Czekanowski (1928) and Stanislaw Klimek (1935), for use in physical anthropology and ethnography. For each pair of languages, on a list of N features, calculate a (number of features shared by both languages), b (number of features in the first language but not in the second), c (number of features in the second language but not in the first), and d (number of features in neither language). This produces a 2×2 contingency table, a well-studied mathematical entity enabling various forms of analysis. In particular, the quantity Nr^2, where $r = (ad - bc)/\sqrt{(a+b)(c+d)(a+c)(b+d)}$, is χ^2 (one degree of freedom), enabling one to test the statistical significance of the relationship between the two languages. The values of r for all pairs of languages under consideration can become the input to various methods (e.g., hierarchical cluster analysis) for family tree reconstruction. The method is simple but not unproblematic (e.g., construction of the feature list, difficulties with nonindependence of features, interpretation of correlations especially if negative) (for complete treatment and commentary, see Embleton, 1986).

The second numerical method in historical linguistics is Ross's root-retention model (1950). For N features and m languages, construct an $N \times m$ table in which a cell has a cross if that language exhibits that feature. The question of relationship of languages can then be recast as whether or not the crosses are distributed randomly in the table. For each pair of languages, calculate n_1 (number of features found in the first language, the number of crosses in the first column), n_2 (number of features found in the second language, the number of crosses in the second column), and r (number of features shared by both

languages, the number of rows with a cross in both columns). Then the probability for that pair of languages of obtaining the shared number of crosses or more is

$$\sum_{R=r}^{N} = n_1 \frac{\left\{ {n_1 \atop R} \right\} \left\{ {N-n_1 \atop n_2 - R} \right\}}{\left\{ {N \atop n_2} \right\}}$$

for which a normal approximation exists. These probabilities can be tested for significance, and could become the input for various family tree reconstruction methods. Interestingly, Ross's method can be shown to be mathematically equivalent under certain conditions to that of Kroeber and Chrétien, and thus subject to the same problems (for complete treatment and commentary on this and the method in general, see Embleton, 1986). Although certain elements of these models recur today, both have largely been abandoned, although the problems encountered and lessons learned remain relevant.

Historically, the next method to evolve was Swadesh's, but given its centrality to the field and ongoing relevance, the author deals with that in a separate section. A final numerical method to consider is that of counterindications originated by Gleason (1959), later rediscovered by others. All topologically possible family trees for the languages in question are constructed, each is evaluated for how well it fits against a fixed list of features (every time the tree does not fit the distribution of that feature, a counterindication is recorded), and the tree with the best score (even if not perfect) is chosen. This method is difficult to implement for two reasons. Even with modern high-speed computing and sophisticated algorithms, the number of topologically possible trees for even a moderately sized language family quickly becomes unworkably large. The method is also highly vulnerable to the effect of borrowing across languages. A variant of Gleason's method, relying on hierarchical clustering and attempting to estimate branch lengths (i.e., used glottochronologically), is shown in Embleton (1986), along with a complete discussion of the method itself. Taylor et al. (2000), using recent advances and sophisticated techniques from computer science and biological cladistics, are developing a character-based (rather than distance-based) method for family tree reconstruction with some similarities to Gleason's method. Despite difficulties with dealing with borrowing in realistic amounts, such methods are promising partly because they closely parallel the cognitive processes of skilled practitioners of traditional comparative historical reconstruction techniques, while being more objective and simultaneously handling vast amounts of data.

Swadesh

By far the best known numerical method in historical linguistics is that introduced by Swadesh (e.g., 1950), actualizing Sapir's statement by regarding lexical replacement as analogous to radioactive decay. As with carbon-14 dating, dates could then be provided for branching points in the tree (glottochronology). Take a list of N meanings of supposed basic core vocabulary, found universally in all cultures, expressing basic noncultural concepts, expected to be more resistant to change and borrowing than other vocabulary items. Such a list, now known as a Swadesh list, contains such items as lower numerals, simple kinship terms, body parts, topographical terms, widespread flora and fauna, pronouns (personal, demonstrative, and interrogative), verbs denoting basic actions, and naturally occurring noncultural phenomena. Assuming a constant rate of replacement, R, for words representing meanings on this list, one can calculate the time elapsed (time depth) since any pair of languages split using the formula

$$\frac{-1}{2R} = In\left\{\frac{c}{N}\right\}$$

where c is the number of cognates on the Swadesh list between the two languages compared. By calculating time depths for all pairs of languages under consideration, we can construct a family tree with dates.

Swadesh's method was greeted with widespread enthusiasm and widely applied in the late 1950s, the 1960s, and the early 1970s, almost with a sense of euphoria about finally having an exact tool for obtaining insights into hitherto unknowable linguistic prehistory. The debate over Swadesh's method quickly became emotional, but regardless of the researcher's subjectivity, a common core of problems can be identified, sometimes with potential solutions.

Difficulties with particular meanings on the Swadesh list include the following:

1. Some meanings cannot be translated into the target language. This is fairly rare, and best treated as missing data, reducing N accordingly.
2. Sometimes there are multiple possible translations in the target language for a meaning on the list. Different researchers might make different but equally valid choices from the range of possibilities ('multiple synonymy'). Solutions include always counting only the most frequent possible translation, choosing at random, always choosing to maximize the cognate count, always choosing to minimize the cognate count, or various fractional scoring systems.

Difficulties with cognacy judgments (remember that one is not necessarily dealing with languages where the history and hence cognacy are well known) are as follows:

1. Due to accumulated sound change, cognates may not be recognizable, causing us to overestimate time depth.
2. Chance similarities may be wrongly interpreted as cognates, causing us to underestimate time depth. In practice, one might hope that this and the preceding cancel out.
3. Sometimes only one part of a word is cognate to a word in another language ('partial cognation'); how should one score this? Solutions include always counting this as positive, always counting this as negative, or various fractional scoring systems.

Problems with the universality of R, which was shown to vary over time, between languages, and according to meaning. R had been estimated from languages with written historical records as about 14% per millennium for the standard 100-word Swadesh list and about 19% per millennium for the

standard 200-word Swadesh list. Not only might the very fact that these languages are written bias the rate (one might expect less replacement in a language with a lengthy written history), but 11 of the 13 pairs used to establish the rate were Indo-European (representing only three of its branches).

Problems with the family tree (Stammbaum) model, generally centered on the splits not being clean (thus giving any precise date is artificial and meaningless). Languages are often in close physical proximity even after they split, mutually influencing one another; tendencies in the two languages predating the split may come to fruition only afterward. Both these interfere with the model, but are more properly problems with the family tree model, and Swadesh's adoption of it, rather than problems with Swadesh's method itself.

Borrowings between languages (related or unrelated) can alter replacement rates quite substantially. For some languages, even the Swadesh list contains a high amount of borrowed vocabulary.

For various reasons (see Embleton, 1986, and elsewhere), the use of Swadesh-style lexicostatistics and glottochronology waned by the mid-1970s, although applications lingered on in several language areas, and the methods continued to be refined by applied mathematicians.

Sankoff

Most refinements introduced by applied mathematicians involved adding further parameters to the basic Swadesh model. For example, parameters were added to account for drift and for 'chance recurrent cognation' (i.e., when a word was replaced twice, such that the original word was restored), replacement rates were allowed to vary from meaning to meaning, a very crude allowance was made for borrowing, and there was talk of allowing the rates to vary from language to language and from time to time (further details, along with some models, can be found in Embleton, 1986). Some of these are useful refinements (e.g., allowing replacement and borrowing rates to vary over time, between languages, and between meanings), but these are very much a mathematician's way of solving the problem, producing quite elegant solutions. But in the real world in which the linguist works, all those parameters have to be estimated – and this is surprisingly difficult even for well-studied languages for which we actually have both long and extensive written records. It is also the case that an extraordinary amount of data is required to estimate so many parameters, and this is most often simply impossible. So these elegant theoretical solutions have very little practical import.

However, the single most important development was the incorporation of a geographical dimension into the family tree, thus allowing for borrowing to be largely dealt with. The basic insight here is due to Sankoff (1972), with correction and further refinement by Embleton (see 1986 for the most comprehensive treatment). The resulting set of differential equations required to reconstruct the tree and estimate the branch lengths is complicated, reflecting the increased power of the method (equations are given in Embleton, 1986, and elsewhere). The parameters required all have some reasonable chance of being estimated, even for lesser studied families; these are a similarity measure for each language pair, replacement rates for each language, borrowing rates between each language pair (not necessarily symmetric), and knowledge of which languages are in contact with one another.

Starostin

Largely independently of the work described above, research on numerical methods in historical linguistics was proceeding in the Soviet Union (later Russia or 'in diaspora'). Unlike the impetus for Swadesh's work, which was largely to aid in providing histories and trees for relatively little studied language families (e.g., Amerindian), much of this work gained its impetus from questions of more distant linguistic relationship. This had its effect on the development of the methods, because it was crucial that the methods be able to produce useful results even at much greater time depths, where Swadesh's method typically has difficulty distinguishing the signal (cognacy, true genetic relationship) from the noise (chance resemblance, contact relationship).

Historically, the first advance here was due to Dolgopolsky (1986), who capitalized on the fact that different meanings change at different rates. He compiled a list of the 15 most stable meanings, based on examination of 140 languages. One can then calculate the probability of fortuitous coincidence of the words representing those 15 most stable meanings for any language pair; if the probability is significantly less than that expected by mere chance, this can be taken as evidence of relationship. This method is most striking in its extreme simplicity, but can also be related to some more complex and ongoing work, largely carried out in Eastern Europe, founded on the observation that several characteristics of a word (e.g., length, number of meanings, age) are intercorrelated with its frequency. Words of more recent origin tend to be less frequent, longer, and have fewer meanings, whereas older words tend to be more frequent, shorter, and have more meanings. The age–frequency relationship in particular is being extensively researched, seeking a small hard core of ancient short vocabulary that may reveal distant relationships, and may even be able to be harnessed into a lexicostatistical or even glottochronological method.

Another advance has been made by Sergei Starostin, with work first published in the 1980s and continuing until his death in 2005, known as root glottochronology or etymostatistics (see Starostin, 1999). Compared to standard Swadesh-style glottochronology, the main innovation is the observation that while glottochronology regards any change (however small) in a word's meaning as a loss of that word from that meaning, root glottochronology does not. Thus, while standard glottochronology sees English *dog* and German *Hund* in the meaning 'dog' as noncognate, root glottochronology notices the existence of the English word *hound*; this more conservative approach to the maintenance of a language's root stock enables one to work better at greater time depths. Starostin's method also gives more accurate results for known cases where the time depths are more shallow (standard glottochronology tends to give dates that are too recent). Root glottochronology takes a text, containing a given set of words in the parent language, and then measures the number of these words still extant (in any derivative, with any semantic shift) in the daughter language. It proceeds only with detailed comparative historical and etymological analysis

(eliminating look-alikes and loans), and can also be repeated for more than one text (hence a different set of words), giving greater precision and potentially some estimate of error (see Starostin, 1999, for formulas and more detailed explanation).

Ringe

Various linguists have used probabilistic methods to assess similarity between vocabularies of two different languages, usually focusing on phonological similarities (an early example is Ross, 1950). The basic question is whether the observed degree of similarity between the two vocabularies is greater than what could be expected based on chance. Although the problem is conceptually simple, it quickly becomes mathematically intractable even between just two languages, as one has to wrestle with different phoneme distributions, different phoneme frequencies, how to measure phonetic distance between different phone(me)s, different phonotactic structures, and lengths of roots, quite apart from the questions (familiar from glottochronology) of how much semantic latitude to allow between the words compared. The most recent and sophisticated treatment of this problem is by Ringe (e.g., 1998 and references therein; McMahon and McMahon, 2005: pp. 50–68), who attempts to account for many of the above issues, albeit with simplifying assumptions. This research remains active, yet without consensus as to its utility, partly because of the degree of the simplifying assumptions, and also partly because it has mostly been applied in the realm of long-distance relationships, where the emotions over the results can sometimes cloud the objectivity with which the method is viewed.

Current Work and Future Directions

Research in numerical methods in historical linguistics has reentered the mainstream after several decades on the sidelines. Several recent collections, published in mainstream venues, demonstrate the diversity and debates within the field; see in particular two special issues of journals (McMahon, 2005; Wichmann and Grant, 2010), as well as Holman et al. (2011), Eska and Ringe (2004), and Levinson and Gray (2012). The most active areas of current research are improvements to the basic Swadesh model; exploration of the age–frequency relationship; root glottochronology; computer-implemented tree reconstruction using methods borrowed from biological cladistics, due to the conceptual parallels between language change and biological evolution (computational cladistics, computational phylogenetics); and Ringe's probabilistic methods. The degree of mathematical, statistical, and computational expertise required is extremely high, which prevents the majority of historical linguists from ever mastering the methods, and consequently renders them unable to do more than use results produced by others or participate in research teams where others control the methods. There is a growing realization, however, that numerical methods while not providing any magic solutions to any long-standing problems, make a useful contribution as one of the tools that we use to explore our linguistic history and prehistory.

Abstract

'Historical sociology' is the systematic examination of the past to inform and reconstruct empirical findings and theories about the world. Its roots lie with sociology's classical founders, but it experienced vibrant growth and reconstruction after World War II. Today it is characterized by methodological pluralism, as well as a wide engagement with social-scientific questions of large-scale social change, the emergence and institutionalization of modern societies, and the epistemological foundations of social science history.

Historical sociology is the systematic examination of the past to inform and reconstruct empirical findings and theories about the world, and it is as old as sociology itself. Virtually all of the classical founders of the discipline – including Auguste Comte, Harriet Martineau, Karl Marx, Max Weber, Emile Durkheim, Georg Simmel, and W.E.B. Du Bois – invoked and analyzed history in their arguments about the nature and fate of modern social relations. Today, this engagement with history remains the vibrant core of historical sociology, even as it is complemented by more formal and abstract methodological reflections on the roles of time and sequence in processes of social change.

To emphasize the continuity of historical sociology between the age of the classics and now, however, is not to deny the dynamism of the field. Indeed, in one sense historical sociology has only recently returned to its roots. The field's classical representatives were keen to understand the genesis and vicissitudes of modernity in all aspects, and they situated their investigations in the broadest global and indeed imperial context (Steinmetz, 2013; but cf Magubane, 2004; Connell, 1997). Yet, as sociology as a whole – and historical sociology along with it – entered a new phase after World War II, many earlier and even contemporaneous insights were cast aside. This shift had many causes, but it was partly due to the analytical pull of Marxian analysis and responses to it, which narrowed privileged substantive objects of inquiry to structural political economy and the rise and dynamics of the modern nation-state.

Narrowing historical sociology to these overarching concerns and questions provided some real intellectual benefits. For example, research in historical sociology galvanized around a focused research program, which led to a series of paradigmatic works and generated insights into long-standing questions of social change. Barrington Moore, Jr's examination of the *Social Origins of Dictatorship and Democracy* (1966), a key early work in this vein, examined the interaction of class and commercializing agriculture in the shape modernizing European regimes took; Theda Skocpol's *States and Social Revolutions* (1979), another canonical text, compared several modern-world revolutions in the hopes of uncovering their common causes; Michael Mann's *Sources of Social Power* (1986) expanded a multicausal view of social change throughout human history; and the influential volumes edited by Charles Tilly (1975) and Evans et al. (1985) revolutionized the study of state formation and the administrative dynamics of governance. Immanuel Wallerstein's *The Modern World System 1* (2011[1974]), the most global of the major second-wave works, also insisted on the politico-economic foundation of social change and the post-1500 supersession of empires by states.

While each of these works in historical sociology's 'second wave' emphasized different aspects of social change, taken together they explored how modernizing states were 'potentially autonomous' from the societies they governed, and indeed how interstate competition and states' efforts to extract resources from their populations explained the forms regimes throughout the world took. Moreover, they also emphasized the other face of this process – how increasingly sophisticated political and state development intertwined with social and protest movements among the populations governed by emerging states, and how these populations sought to be recognized and to transform social relations through collective social action and protest.

The remarkable insights of the second wave of historical sociology were purchased at some cost. To facilitate comparison, and to more easily generalize their findings beyond the historical contexts they examined, second-wave authors privileged seemingly objective factors like political economy, international relations, and interest-based action. This shift away from contextual understanding of historical actors' outlooks and motives for their actions and toward structural constraints had substantive and methodological consequences. Substantively, it meant that the self-understanding of historical actors, as well as the categories usually applied to those understandings in sociology – including forms of identity – received relatively short shrift. For example, second-wave analyses of violence tended to concentrate on the size and organization of armies, the frequency and structure of urban disturbance, and the ways states financed military ventures. Meanwhile, however, key questions of how explicit violence and more subtle forms of coercion signaled the rise of modern self-understandings and forms of discipline were left aside, and it has only been recently that such foundational work on the subject as Norbert Elias' multivolume *The Civilizing Process* (2000) and Michel Foucault's *Discipline and Punish* (1977) have been reincorporated into the field of historical sociology.

Methodologically, moreover, authors in the second wave usually stressed the independence of their historical cases, in order to more clearly analyze the causes of the phenomenon at hand. Yet many world-historical events and processes are *not* independent of one another, and indeed, a crucial aspect of historical change lies in their interrelationship. Consider Theda Skocpol's groundbreaking study of great revolutions (1979). In order to explain the causes of social revolutions *in general*, Skocpol treated the Russian, French, and Chinese revolutions as independent cases and compared their causes with one another using John Stuart Mill's famous method of causal inference. Jack Goldstone's (1986) innovative work on demography and the institutional basis of revolutions extended the comparative ambit even more broadly throughout the early modern world. However, as William Sewell, Jr (1996) and Michael Burawoy (1989) argued, revolutionaries understood themselves to be mimicking their predecessors (or at least trying to avoid the mistakes of earlier revolutions), so that later revolutions descended from earlier ones rather than simply appearing alongside them in the historical record. As do historians, historical sociologists continue to grapple with the importance of sequence and causality in history (see, e.g., Abbott, 1995; Haydu, 1998).

Partly to address these kinds of substantive and methodological gaps in the second wave, historical sociologists in a nascent 'third wave' have looked to 'repressed' aspects of the second wave while pushing historical sociology in fresh directions (Adams et al., 2005). This ongoing movement has yet to coalesce around central findings in the same way as the second wave ultimately did, but so far it has begun a fruitful dialogue between the second wave's emphasis on state–society relations and larger questions of culture, religion, race and ethnicity, gender and sexuality, agency, and the generative properties of social interaction. Moreover, this dialogue has already yielded some provocative new directions of study. For example, Jack Goldstone recently suggested (2001), in contrast to his earlier (1986) work on demography and the causal basis of early modern revolutions, that revolutions be treated as emergent phenomena. Rogers Brubaker (1992), Margaret Somers (2008), and Ron Aminzade (2013), in quite different ways, have brought culture to the forefront in analyzing the development of varied patterns of national citizenship. Eiko Ikegami (1995) and Philip Gorski (2003) both demonstrated how culturally rooted modes of social discipline transformed over time in relationship to the foundation of modern states. Adams (2005), Charrad (2001), and Clemens (1997: esp. Ch. 6) have addressed how gender (historically specific forms of masculinities and femininities) intertwined with political and social regimes in the early modern and modern eras in ways intrinsic to institutional outcomes like state formation and political upheaval. And George Steinmetz (2007) and Julian Go (2011) revitalized interest in the sociological studies of empire, while Miguel Centeno (1997), James Mahoney (2010), Yang Su (2011), Xiaohong Xu (2013), and others have pushed the analysis of regime transformation, development, and social violence well beyond Europe's boundaries.

This third-wave dialogue with earlier findings in historical sociology was accompanied by revitalized interest in the field among a broad class of neoinstitutional and economic social scientists. Led by Viviana Zelizer (1985), Frank Dobbin (1997), Neil Fligstein (1993), Monica Prasad (2006), Bruce Carruthers (1999), Marion Fourcade (2009), and Lyn Spillman (2012), these works used historical evidence and analysis of change over time to trace the divergent institutional structures that shaped contemporary political economy. These range from nationally rooted conceptualizations of appropriate market boundaries (in the case of Dobbin) to how the economic evaluation of children shows the changing configurations of market, state, and family (in Zelizer's case) to how economic crises filter through firms' 'conceptions of control' (Fligstein) to how interactions of the political style of organized labor and state regulation produce alternative 'politics of free markets' in advanced economies (Prasad). Today, because of the ongoing globalization of these institutions as well as the underlying documentary sources, a clear new frontier of economic sociology will be systematically evaluating developments in emerging economies in the same light.

Beyond its new substantive directions for research, the third wave is also awash in exciting methodological discussion and experimentation. Some have borrowed modes of analysis and methods from other parts of the social sciences to make innovative historical arguments. For example, Edgar Kiser (e.g., Kiser and Linton, 2002) and Ivan Ermakoff (2008) used game-theoretic models of social interaction to explain macrolevel outcomes in regime behavior, and Andreas Wimmer and Yuval Feinstein (2010) employed statistical modeling of territorial change among systems of political regimes to rigorously test second-wave theories. In terms of broader discussion, the map of explicit methodological formulations in historical sociology today has at least three noteworthy locations. Some (e.g., Ragin, 1989; Mahoney and Rueschemeyer, 2003) have sought to buttress and update Skocpol's invocation of Mill's comparative method to accommodate large-N studies and the complex realities of less-bounded entities and muddy social causation. Others have taken a very different tack, emphasizing the deep interpretative grounding of historical events in the meanings and worldviews of the participants (Bonnell and Hunt, 1999; Reed, 2011). Still others have sought to steer a course between these alternatives, emphasizing the possibility of 'eventful' social change based on the emergence, invocation, and transformation of local social meanings (Clemens, 2007; Padgett and Powell, 2012; Sewell, 2005). Together, these approaches have addressed (and questioned) how to sustain persuasive social-scientific arguments engaging historical events when the independence of the events being analyzed cannot be taken for granted and how people's shared capacities and collective imaginations develop and come to obtain explanatory force.

Since these deeper methodological debates swirl around specificity versus generalizability and the roles of context and culture in the explanation of social change – areas of discussion that are quite familiar to academic historians – the relationship between historical sociology and history itself is changing as well. In an earlier edition of this very encyclopedia article, for example, Charles Tilly described the difference between the practices of history and historical sociology in these terms: "Professional historians…specialize in particular times and places, for example, modern Latin America of ancient China…meanwhile, sociologists divided up their own specialties mostly by structures and processes – families, religions, industrialization, crime, and so on – and drew their evidence chiefly

from observation of the countries they currently lived in" (2001, p. 6753). This line is significantly more blurred today. In part, this is because connections among the disciplines have strengthened as universities reconfigured following the global financial crisis of 2008. Thus, while some continue to insist on a sharp distinction between the practices of both disciplines, many other historical sociologists have begun employing archival materials, and historians have increasingly explicitly evaluated social-scientific theories (Mayrl and Wilson, n.d.).

More broadly, however, the blurring and productive tension among history, historical sociology, and other social sciences reflects what Abbott has called the "Chaos of Disciplines" (2001: esp. Ch. 4) – that is, the complicated struggle to construct a productive dialogue between history and social science while also maintaining a legitimate position as a scientific enterprise (for recent surveys of this terrain, see Lachmann (2013) and Lang (2012)). This tense process is characterized by the emergence of 'historical' branches of inquiry in social science disciplines adjacent to sociology. For example, scholars housed in political science or in crossover spaces produce work largely indistinguishable from third-wave historical sociology: for instance, *The Search for American Political Development* (Orren and Skowronek, 2004) and the body of excellent historically informed investigations of welfare policy processes (compare, for example, Weir (1992) and Kahl (2005) with Fox (2012)) as well as work by historical sociologists of interest in comparative politics and the study of American political processes (e.g., DeLeon et al., 2009; Riley, 2005; Slez and Martin, 2007). Likewise, neoinstitutional economics has long emphasized the dependence of economic development on preceding historical events, in both historical-descriptive (North and Weingast, 1989) and more formalized modes (Greif, 2006). Yet, as each of these subdisciplines turns to history, its practitioners also continually are made to justify themselves as producing something 'more than history,' and are frequently asked to defend the validity, methodology, and generalizability of their findings to their own disciplinary mainstreams.

Beyond these constraints of mainstream justification, this give-and-take of disciplinary cross-fertilization and justification produces enormous opportunity for the future of historical sociology. The improved dialogue among historically oriented sociologists, historians, political scientists, and economists has created a novel and important opportunity: to use the deep emphasis of history on the embeddedness of action within the tectonics of social structures to unwind the decades-long 'Parsonian Bargain' that has cordoned off the challenges of social science history from the discipline of economics in particular. Call it, if you like, another aspect of the 'Piketty moment' (Piketty, 2014). In addition, the range of claims made about the scope conditions of social-scientific theories across historically oriented inquiries presents a chance for a thoroughgoing reconstruction of the sociology of knowledge (e.g., Camic et al., 2011; Kennedy, 2014; Reed, 2011), probing the making of seemingly objective knowledge from socially embedded positions by both historical actors and social scientists and historians today. Finally, the dramatic resurgence of proto-, semi-, and nonstate forms of governance across the world – comprising part of contemporary globalization – impels analysis by sociologists, and social science historians more generally. If comparative historical sociology did not exist, one would certainly have to invent it.

Historical Thought and Historiography: Christian Tradition

Christoph Markschies, Theologische Fakultät der Humboldt-Universität zu Berlin, Berlin, Germany

Abstract

Ever since the beginnings of orderly reflections on the topic of history in Christianity and the first literary attempts to write history, four basic problems have been characteristic of all such attempts. All Christian historical thought and also all Christian historiography can be characterized by basic decisions concerning the following four problem areas: (1) the classification as a specific inside or outside perspective on Christianity; (2) the respective understanding of the position of one's interpretation on a range between historical and theological standards; (3) specific mechanisms of selection; and (4) a small number of models by the help of which the past is reconstructed. These four basic problems of Christian interpretations of history cannot be solved by means of an isolated special theological hermeneutics. They call for an original contribution to the general discussion of history and of the interpretation of history.

Ever since the beginnings of orderly reflections on the topic of history in Christianity and the first literary attempts to write history (by the author of *The Gospel According to St. Luke*, AD *c*.81–96, cf Luke 1, 1–4 and Eusebius of Caesarea, AD *c*.264–340, *Ecclesiastical History*), four basic problems have been characteristic of all such attempts. Their uninterrupted significance from the ancient world up to the present allows development of a history of problem areas of Christian historical thought. All Christian historical thought and also all Christian historiography can be characterized by basic decisions concerning the following four problem areas: (1) the classification as a specific inside or outside perspective on Christianity (Section The Problem of Inside Perspective and Outside Perspective); (2) the respective understanding of the position of one's interpretation on a range between historical and theological standards (Section Christian Interpretation of History – Historical and Theological Standards); (3) specific mechanisms of selection (Section The Mechanisms of Selection of Christian Interpretation of History); and (4) a small number of models by which the past is reconstructed (Section The Basic Models of a Christian Interpretation of History).

The Problem of Inside Perspective and Outside Perspective

A Christian understanding of history describes Christianity from an inside perspective; but in many cases such descriptions can, to some extent be regarded as outside perspectives. This is because, together with an outside perspective on Christianity, for example, by non-Christians, there are also outside perspectives of Christian minorities on Christian majorities, and vice versa. Such perspectives have a special forming influence on the understanding of history: The *Ecclesiastical History* by Theodoret of Kyrrhos (AD *c*.393–466), one of the most definitive works of Christian historians of the second generation after Eusebius, regards historical developments as formed by the debates between orthodox church ('orthodoxy') and apostate heresy. The *Ecclesiastical History* by his contemporary Philostorgius (AD *c*.368–425) has the same perspective, however, with the opposite judgment: the theological tradition of the Alexandrine presbyter Arius (AD *c*.260–336), which has influenced theological thought mainly in Great Britain up to the present, is regarded as true orthodoxy by Philostorgius but as apostate heresy by Theodoret. Besides these, there have always existed more or less critical descriptions from an outside perspective by non-Christians (e.g., by the Roman historian Ammianus Marcellinus, AD *c*.330–395, in the heyday of Christian historiography in late antiquity) in which Christian historians were tackled implicitly or explicitly.

It was only in modern Europe that Christian historians have made determined attempts toward a reduction of inside-perspective elements in Christian historiography. This is, of course, mainly with respect to the narrow horizon of thought formed according to the self-awareness of the three Christian denominations that arose in Central Europe after the religious wars of the sixteenth and seventeenth centuries (the Religious Peace of Augsburg 1555 and the Peace of Westphalia 1648). At the beginning of the modern era, reflecting denominational antagonism, the Lutheran, Reformed, and Roman Catholic interpretations of history entered into competition. The protagonist of the overcoming of this denominational approach to the history of Christianity was Gottfried Arnold (1666–1707; Professor of History in Giessen 1697–98). He tried to write an '*unpartheiische*', which is a nondenominational church history. In the twentieth century, following the institutionalization of the ecumenical movement, which has tried to overcome the denominational splittings of the sixteenth century, the call for a general 'ecumenical church history' (Ernst Benz) arose. In a widespread late twentieth-century attempt to conceptualize the alternatives, 'church history' as opposed to 'history of Christianity' has been used. 'Church history' describes a perspective orientated toward the Christian denominations, and 'history of Christianity' describes a trans-denominational perspective.

Christian Interpretation of History – Historical and Theological Standards

A Christian interpretation of history experiences a tension between historiography (or history) on the one hand and

Christian theology on the other. This tension has existed from the very beginning insofar as theology (which in this context means the theory of the Christian faith) naturally favors certain theoretical options when reconstructing a history, for example, its assumption of a god acting in history, which other interpretations of history may hold but are by no means bound to hold. Such specific theoretical options always have methodical consequences; this is what the religious philosopher Ernst Troeltsch (1865–1923) showed in his clear analysis and what has been called 'historical or dogmatic method' (Troeltsch, 1922: pp. 729–753). But one must not overestimate the 'theological' elements of Christian interpretations of history before the modern era: from the fourth century they had as a matter of course been orientated toward the literal and methodical standards of the interpretation of history of their respective times. This theoretical background was broken only very partially by specific religious or theological concepts. The first author of an ecclesiastical history, Eusebius of Caesarea, already followed the forms and standards of the historiography of his time in his historical writing, as can be seen in the prologue (Eusebius, historia ecclesiastica 1, 1, 3f). Consequently, his account leaves out central questions of a theological interpretation of history. Because pagan ancient historiography very rarely explicitly treated the difficult relation between divine acting in history through fate (τυχη/*tyche* or *fatum*) and human freedom, Eusebius, too, never picked out the exact relation between man's freedom and God's acting in history as a central theme.

The fundamental problem of the relation between an interpretation of history according to modern standards on the one hand and specific theological premises on the other hand intensified in modern Europe. In the course of the modern secularization of historical thought, under the premise of *etsi Deus non daretur* (God is not necessary), new determinants of history (such as fate, chance, reasons of state, and ethics) were established in place of the Christian approach to a history regarded as being under the law of God. In consequence, the problem of how – under these conditions – a theological view of history was possible increased. Most Christian interpretations of history after the Enlightenment have, however, tried to take up the problem, often through a religious or theological interpretation of the philosophical framework of the historiographic theory. The Berlin theologian Friedrich Schleiermacher (1768–1834), for example, made the following point in his notes of the years 1796–99: "*Die Historie ist immer religiös und die Religion muß ihrer Natur nach historisch sein*" ("history is always religious and religion must be historical by nature", Schleiermacher, 1984: p. 25). At the same time the possibility of a Christian interpretation of the world, which was lost during the period of Enlightenment, was meant to be restored by means of such a religious charging up of history.

The Mechanisms of Selection of Christian Interpretation of History

All interpretation of history and, furthermore, all historical writing, is characterized by acts of selection from a huge amount of material. Within the framework of a Christian interpretation of history, first the basic choice of subject must be made: to date, it has been heavily disputed whether a Christian interpretation of history merely ought to deal with certain fields of general history such as Christianity, the history of certain denominations or ecclesiastical groups, or a particular history formed in a particular way by a transcendental power ('*Heilsgeschichte*', 'salvation history'), or whether a Christian interpretation of history ought rather to come up with a distinctive Christian perspective on history as a whole called 'world history' since the end of the eighteenth century. The controversies over whether the chosen ideological perspective necessarily leads to a concentration on an ecclesiastical history, or on a history of Christianity, or alternatively on the wider framework of a universal history, has always been an issue in Christian historical writing.

The first Christian author of a historical monograph, Eusebius, chose to concentrate on an ecclesiastical history without any detailed consideration of the political history of his time. A universal history, now lost, was presented by the Greek presbyter Philippus of Side less than 100 years later, before AD 439. The Christian interpretation of history that has had the strongest influence up to the modern era, and which was fundamental in the Middle Ages, was written by the North-African theologian Augustine (AD 354–430). It takes the perspective of a universal history: after the city of Rome had been captured by the Goths in AD 410, both pagan and Christian interpretations of history, which until then had their focus in the Empire, broke down because of the obvious collapse of the Roman Empire. As a consequence, the bishop was bound to develop his own distinctive concept of a universal history which would be able to convey a new sense of history. Augustine presented it with his work *De Civitate Dei*, '*The City of God*' (AD 413–426; for details see Section The Basic Models of a Christian Interpretation of History).

While the Middle Ages mainly expressed concepts of universal history based on Augustine's, for example, by Otto of Freising (*c*.1112–58), the traditional Christian universal–historical interpretation broke down during the Enlightenment. Theological categories, such as 'God's revelation' or 'God's acting', which had been systematic premises of the Christian interpretation of a universal history, and had consequently formed a unity of transcendental and earthly reality, became problematic. After the attempts of the nineteenth century to recreate such a concept of unity on a new basis, and thus to once more present a Christian interpretation of a universal history (in very different ways by Schleiermacher, Hegel, and Ranke), the twentieth century progressively withdrew from such theological interpretations of history. Christian interpretation and presentation of history in the twentieth century were more or less confined to the specific context of Christianity and church, even if the theoretical basis was sometimes broader. That was the systematic reason for the modern criticism of concepts which attempted to create a close correlation between the history of human development and God's acts of salvation, by way of 'salvation history', the theological interpretation of certain incidents.

Along with the fundamental question of whether a Christian interpretation of history must be understood universally, or be restricted to a history of Christian institutions, there are other mechanisms of selection taken from general historiography which are of importance to a Christian interpretation of

history. Historians of the ancient world and the Middle Ages used, as important mechanisms of selection, the questions of the meaning of an incident, of its benefit for future generations, or of its documentation in the respective privileged sources, and so forth. The bias thus created is obvious. However, in general, the critical sense with which historians before the modern era treated their own modes of selection is underestimated. Such reflections were usually made in the prologue of historiographical works.

The vehement calling into question of traditional mechanisms of selection in the general history of the twentieth century (see, e.g., the criticism of any historical interest with a biased concept of histories of ideas or politics, the criticism of the concentration on Europe, and of the neglect of feminist research) reached the historiography of Christian denominations with a certain delay; its consequences on a general Christian historical awareness only gradually become apparent.

The Basic Models of a Christian Interpretation of History

Christian conceptions of history up to the modern era usually have reconstructed it on the basis of a small number of comparatively simple models. Eusebius describes the history of the church according to a model of a process of constant 'advances', something which is in strict contrast to the historiography of his times with its stress on cyclic processes and the decadence of traditional Roman values. The history of his own religion teleologically leads to the Christian empire of Constantine. Augustine breaks with Eusebius' model of a progress with his concept of two cities (*civitates*) wandering through the ages. He differentiates between the *civitas Dei*, the 'citizenry of God' as an earthly community of the heavenly citizens, and the *civitas diaboli*, 'the citizenry of the devil'. Of course, the Roman state and the community of those who do not live under God and toward him are not identical in the sense of the state as such being the *civitas diaboli*. But Augustine takes up the traditions of radical Christian criticism of the state, and with his anthropologically based historiographic model gives a clear analysis of the social deficiencies of his time. The European Reformation breaks with this conception. It mainly follows the models of decadence developed by the medieval church reformers, which can also be found with humanistic authors: the promising beginnings of the first Christians had decayed in a middle period which is only now brought to light again. This conception was monumental, and had a strong anti-Catholic impetus in the so-called Magdeburger Zenturien – a team effort by protestant theologians (Basel 1559–74) led by the strict Lutheran Matthias Flacius Illyricus (1520–75), which has been known under that name since the eighteenth century, and which has remained a fragment. Along with a comparatively simple modeling, the work is characterized by the use of an enormous number of sources. Cardinal Caesar Baronius (1538–1607) reacted to this challenge with his *Annales Ecclesiastici*. But this catholic reply, in terms of method only, mirrored the protestant work, and it tried to answer the reproach of having broken with the truth with a proof of uninterrupted continuity from the age of the early Christian church.

The model of decadence gained special influence (e.g., in Goethe's work); Arnold applied as a basis – despite his programmatic orientation toward an impartial standpoint. Arnold explained the history of Christianity according to a model of progressive decadence, beginning after the pure earliest church. Despite his persistent interest in counterevidence to official protestant ecclesiastical historiography, he held to his conception of decadence, and to a structural principle of the denominational history of Christianity. Such simple basic models for the reconstruction of the history of Christianity were by no means, or first, only questioned by the European Enlightenment. Augustine's criticism of Eusebius' conception of progress in *De Civitate Dei* is an example, because it was motivated by an empirical diagnosis of society and by critical work on biblical texts. Humanist historians of the Reformation must also be mentioned, particularly Philipp Melanchthon (1497–1560) and Johannes Sleidanus (1505–56). In his short world history and in a work on contemporary history entitled *Denkwürdigkeiten, betreffend Staat und Religion unter Kaiser Karl V*, strict models of decadence are missing. Sleidanus always endeavored to describe religious changes with regard to imperial power and state power; he can be regarded as one of the progenitors of a strong orientation toward political history.

Along with the orientation toward simple conceptions of progress or decadence, the history of Christian historiography, and the Christian awareness of history, has called into question oversimplified models up to the present. In Ranke's formula, for example, each epoch is immediate to God; divisions into periods are good indicators for the respective underlying models. In this respect, denominational Christian interpretation of history tends to differ from the standards of general history; protestant conceptions, for example, speak of a 'period of Reformation' as a threshold between the Middle Ages and the modern era.

The four basic problems outlined above have characterized Christian concepts of history from its beginnings, and they show that the crucial changes in Christian interpretation of history caused by the increasing influence of the methodical standards of modern historiography and finally by the victory of historicism, must not be overlooked in theology, either. The victory of historicism has had a significant consequence on academic theology as a whole, because the historization of all theological disciplines was demanded (among others by Troeltsch), and was partially carried out. It is equally clear and almost undisputed that the general 'crisis of historicism' also had an impact on theological form of Christian interpretation of history, something which had already been diagnosed by contemporary church historians like Karl Heussi (1877–1961). Mainly in continental Protestant theology, this general crisis was accompanied by a theological criticism of general historicism. This development is now called an 'antihistorical revolution' (Graf, 1988: pp. 377–405), a term which points to its consequences: the removal of church history as a leading subject of academic theology.

In the twentieth century, there was an interesting revitalization of apocalyptic thought on a large scale, the relation of which to the 'crisis of historicism' is not immediately clear. This form of Christian theology, which goes back to a movement in Hellenistic Judaism, and which had already left deep marks on

certain biblical texts, is characterized by a distinctive awareness of history. The present time is interpreted as the 'last age', and forms part of a certain fixed scheme of the course of history, while there is no historical interest in the identification of certain 'signs of the times'. In the ancient world, the formation of a Christian awareness of history was accompanied by a drastic loss of meaning of apocalyptic elements for Christianity. The eruptive revival of apocalyptic trends in the Middle Ages, the early modern era, and the present has in most cases been accompanied by a protest against Christian interpretations of history orientated toward the standards of the respective times.

Current Problems and Questions of Christian Interpretation of History

The systematization of current schools of Christian interpretation of history meets with the difficulty of the actual presence of pluralism (Nowak, 1997: pp. 3–12), perceived a 'new confusion'. Such concepts are present in the institutional fields of denominational church history as well as independent of these. The Christian inside perspective, considered to embody prejudice in some accounts, presents a challenge to other approaches to the problems of Christian historicism; they have not, however, discarded it. This shows the limited significance of the presently popular alternatives of a 'church history' and a 'history of Christianity'. In both cases, attempts to take an outside perspective are, more or less admittedly, wrapped in an inside perspective.

Within the horizon of the standards of history at the beginning of the third millennium on the one hand, and of Christian theology on the other, almost all schools have tried to achieve careful detheologization. This, however, is rarely picked out as a central theme. It is only very occasionally that a decidedly theological contribution to the general discussion on history is demanded (Herms, 1997: pp. 305–330); a 'resort to pragmatism' can be noted (Nowak, 1997: p. 12). Even if some historians still demand a concept of universal history in Christian terms as regards the selection of subject matter, most publications actually present contributions to a discipline of general history. That such presentations are in most cases characterized by the leading assumptions of universal history (and theology) is obvious to any sensitive examination; but it is only rarely admitted or made explicit. The presently vigorous call for an approach to church history, or history of Christianity, as historical–cultural studies also implies certain universal–historical structures in the shape of an '*histoire totale*'.

The critical calling into question of historiographical mechanisms of selection and of modeling, which mainly arose in the twentieth century, has increasingly been accepted by the institutionalized Christian interpretation of history. But it is very rare that it is understood as one of the consequences of fundamental decisions made in the course of the European Reformation movement which have created a high level of ideology-critical potential.

These four basic problems of Christian interpretations of history cannot be solved by means of isolated special theological hermeneutics. They call for an original contribution to the general discussion of history and of the interpretation of history. This is especially true in view of the latest developments in 'writing history in the postmodern era': can the concept of a literal sense as the regulatory concept of the process of interpretation really be given up in the course of the deconstruction of its own narrative? Does not a Christian interpretation of history which does away with the 'grand narratives', and the 'master processes' dissolve itself? Is the notion of 'God's acting' dispensable in a Christian interpretation of history? Here, a new and interesting challenge is put to the long-neglected field of a theory of Christian interpretation of history. It is possible that a theoretically renewed, clear-cut, Christian interpretation of history helps to preserve in a positive sense two functions of the Christian interpretation of history under the conditions of the postmodern era: the function of forming society, and the function of critically analyzing society. But with all this, the traditional objections to a simplistically designed history of salvation remain important.

Abstract

Since the subsequent fifth century BC, Greek historians developed a critical attitude to the past, invented methods that made it possible to discern between facts and fiction. The adoption of historiography by the Romans provided the model for constructing the past in the shape of national history. The Christian writers invented ecclesiastical historiography as a subject of its own and a model for universal chronicles and histories starting from the creation.

Historiography, the rational reconstruction of the past in the medium of a prose that claims to literary quality was developed in Greece during the fifth century BC. Its emergence reflects the peculiar intellectual and political developments of this age. The high cultures of Egypt and Mesopotamia had known lists of rulers, their foundations, festivals, and wars that represented the official version according to which the monarch inevitably would crush enemies. There was no need and no chance to develop a conception of the past in which the course of events would be ascribed to the contending efforts of multiple actors, the result of which was unpredictable and thus needed to be reconstructed and narrated in each case. The historical books of the Old Testament, in a certain sense, took account of the contingency of human affairs but at the same time attributed the outcome of events to God's intervention.

The Origins of Greek Historiography

After the development of literacy during the eighth century BC, Greek commemoration of a distant past had materialized in the epic tradition (Homer, Hesiod). Its combination of 'historical' and 'mythical' elements became subject to criticism in an age when sixth century-Ionian philosophy (as represented by the Milesians Thales, and Anaximander) had attempted at a 'scientific' explanation of the physical world and of human society. About 500 BC, Hecataeus of Miletus tried to reconstruct the genealogical facts out of the mythological traditions. He wrote a pioneering work of geography that reflected the expansion of the geographical and historical horizon of the Greeks as a result of their colonization (since *c.*750 BC). This included their expansion on the shores of the Mediterranean and Black Seas, their voyages of discoveries, and the information that the Eastern Greeks (as subjects of the vast Persian Empire) had acquired about parts of Asia. Historiography, in a narrower sense, developed out of the experience of the Persian Wars. However, the realization that the great victories of the Greeks in 490 and 480–479 BC had been achieved, so to speak, against all probability apparently developed only with a certain distance to the events themselves.

Herodotus (*c.*485–after 425 BC; a widely traveled native of Halicarnassus in Asia Minor) opened his account of the Persian Wars with the statement that he wanted to present the results of his research (*historie*) in order to commemorate the deeds of both Greeks and Barbarians and to establish the cause of their conflict. *Historie* is a general term for a rational inquiry. It was only subsequently (especially with Aristotle's *Poetics*) that it became the label for the literary genre that Herodotus had created. Herodotus pointed out that his study was the work of an individual and that he felt obliged to an impartial approach. Greek historiography was developed by free intellectuals and did not start as officially committed accounts. Apparently, especially exiled individuals like Herodotus – and subsequently inter alia Thucydides, Xenophon, and Polybius – were able to take on the position of an (at least, subjective) neutral observer. Herodotus did not only provide the first work of an *histoire événementielle* based on stories that might have been generated two generations before his own time but also continued the tradition of geographical and ethnographical accounts by incorporating digressions on the various peoples (from the Egyptians to the Scythians) under Persian control. Here he relied on local traditions and autopsy and sometimes on reported stories, the authenticity of which he himself doubted.

Herodotus' younger contemporary Thucydides of Athens (*c.*460–400 BC) created a quite different model of historiography. He deliberately distanced himself from Herodotus (though without naming him) as he thought Herodotus to have shown too much confidence in his sources. Thucydides' statements on his methodological principles are (with the notable exception of Polybius) almost without parallel in ancient historiography. He chose as his subject the Peloponnesian War between Athens and Sparta and their respective allies (431–404 BC; Thucydides' account, however, is incomplete and breaks off at 411 BC). According to his own words he had started to take notes at the outbreak of the war as he had anticipated the unprecedented dimensions of this war which affected the whole Greek world. Later, he used his time in exile (the consequence of his defeat as an Athenian general in 424) to collect all available facts by interrogating protagonists and eyewitnesses of both sides. Being confident that he was able to reconstruct the objective course of events he did not name his sources or quote varying, or even conflicting, versions by different witnesses but digested all information into an authoritative account of 'how it had really happened' (an aside of his which was subsequently to be taken up by Ranke). He wanted to differentiate the long-term causes, which led to a climate of mutual distrust between the two powers, from the immediate occasions, which made them take military action. War and civil war were seen by Thucydides as revealing the condition humaine, love of power, ambition, greed, and fear as constituents of people's invariable nature; thus the thoroughgoing analysis of human action should provide insights of everlasting value.

Already Herodotus had incorporated some speeches into his narrative in order to explain the motives behind the decisions of protagonists but Thucydides went much further by systematically using this stylistic device based on the techniques of rhetoric that were taught by contemporary Sophists. As Thucydides explained, his methodological principle was 'to make the speakers say, what, in my opinion, was called for by each situation while keeping as closely as possible to the general sense of the words that were actually used.' Those speeches served to present opposing arguments (in pairs of speeches ascribed to antagonists) and to discuss the political, moral, and juridical implications of certain decisions or to express the self-image of a society (especially in the 'Funeral Speech' attributed to Pericles). The unity of style, the high level of abstraction, the implicit cross-references, and the shortness of the speeches point out that they were primarily a medium to carry the historian's interpretation. Since Thucydides, the inclusion of more or less fictitious speeches was a standard feature of ancient historiography. Thucydides made two exceptions to his principle of writing a strictly contemporary history. He gave an account of the development of early Greek history in order to prove that due to the level of its material culture, a war of such dimensions like the Peloponnesian War would have been impossible. That was a sort of conjectural history based on theories of societal development and on the interpretation of cultural survivals. He also gave a selective description of the 50-year period between the end of the Persian Wars and the outbreak of the Peloponnesian War in which he stressed the rise of Athenian power and the distrust it fostered with the Spartans. This account also served to bridge the gap between Herodotus' narrative and his own.

Thucydides' model of historiography differed from the Herodotean by eliminating the features of cultural history and ethnographical discourse. But both corresponded with respect to concentrating on large-scale wars, which involved great parts of the Greek world, and with regard to treating matters of constitutional history and internal politics of the states concerned only insofar as they were relevant for the course of events. Their different attitudes to the period of time that could be reconstructed by drawing on oral traditions notwithstanding, they both primarily relied on oral sources. As a rule, down to the Christian historians of Late Antiquity ancient historiographers did not consult documentary evidence systematically like inscriptions or state papers in archives and did not engage seriously in 'antiquarian' research on constitutional, legal, and religious institutions. That is why they could not think of replacing the narratives of former historians by a new account based on other better sources. Thus Thucydides was a continuator of Herodotus, Xenophon, and other fourth century historians who started their Greek histories at the point where Thucydides' narrative had broken off. Historians who wanted to treat former times again, cannibalized (often in combination with harsh criticism) the accounts of their predecessors.

The Variety of Greek Historiographical Production

Thucydides had shaped the trend-setting model of military and political history that was followed by a great number of Greek writers including the historians of Sicily. However, his successors embellished the rhetorical elements or amplified scenes with emotive appeals to readers. Throughout antiquity, Herodotus enjoyed a dubious reputation as being not only the father of history but also, at the same time, a narrator of fabulous stories (in Cicero's famous phrase). The broader Herodotean approach, however, was not totally outdone; it was taken up again by the historians of Alexander the Great and survived in subsequent works with strong geographical and ethnographical interests like that of Posidonius (*c.*135–50 BC) and in the specialized geographical works from Eratosthenes (third century BC) to Strabo (Augustan age).

Besides the mainstream of military and political history, a number of specialized historical genres developed since the late fifth and during the fourth centuries. These included: universal history (Ephoros of Cyme, fourth century BC, whose – later lost – work was used by Diodorus Siculus, first century BC); foundation histories, local chronicles, and constitutional histories (e.g., on Athens); cultural histories (Dicaearchus, pupil of Aristotle, late fourth century BC); biographies (late fifth century BC sketches subsequently to be used by Plutarch, AD *c.*45–120; and Xenophon's life of the Spartan king Agesilaus II, fourth century BC).

During the Hellenistic Age, an enormous number of historical works of various kinds were produced by nearly a 1000 historians known to us by name. This tremendous increase of historical production reflected the political reorganization of the Mediterranean world by the establishment of the vast Hellenistic empires (and subsequently the rise of Rome to a world power). It was fostered by the patronage of Hellenistic monarchs and the establishment of libraries and scholarly institutions, especially in Alexandria and Pergamum. Almost all of this extremely rich production has, however, got lost and is only known from quotations and references in subsequent works. For example, the various reports on Alexander's campaigns by court historiographers, officials, and generals only emerge with the compilation of Diodorus; comprehensive accounts of Alexander's history based on the works of his companions dating (?) from the second and third centuries AD (Arrian and Curtius Rufus).

Polybius (*c.*200–120 BC) is the only Hellenistic historian of whose historical work a substantial amount has survived. Polybius, a military fighter of the Achaean Confederacy (on the Peloponnese) was one of 1000 leading Achaeans who were deported to Italy after 167 BC. He came into close contact with prominent figures of the Roman nobility, especially Scipio Aemilianus (the destroyer of Carthage). The subject of his historical work was Rome's rise to world dominion in the time from the Punic Wars to the destruction of the Macedonian state (167 BC). Polybius calls it a 'pragmatic history'; it focuses on political and military actions and is especially based on eyewitness reports and first-hand knowledge of the theaters of war. His intentions and explicit methodological reflections (combined with polemic against several former historians) imply a conscious return to the Thucydidean model of historiography. But Polybius understood Rome's military success as having depended on its uniquely stable, and at the same time flexible, political system. In order to explain this point to his Greek readers, he incorporated a description of the Roman constitution and military system and thus gave a systematical

treatment of institutions otherwise not to be found in ancient historiography. (His analysis of Rome's 'mixed constitution' would become one of the most important subjects in the reception of ancient political theory since the Renaissance.)

Roman Republican Historiography

Roman history was first made the subject of historiographical works by Greek authors like the Sicilian Timaeus of Tauromenium (*c.*350–260 BC) and other Greek writers who were especially interested in the stories about the foundation of Rome. Latin literature only developed from the middle of third century BC as a product of the reception of Greek culture. Certain records of the past, however, had been preserved since early times: public documents like laws, decrees of the senate and international treatises, and family records of the aristocracy. And there were the *annales* kept by the pontiffs in which the names of consuls (the eponymous magistrates) were listed, triumphs and religious prodigies were noted, and some miscellaneous information was collected. About 200 BC, the senator Fabius Pictor provided the first history of Rome written by a Roman, yet in Greek. Drawing on the models of Hellenistic historiography Fabius Pictor covered the time from the founding of the city until 200 BC. He probably gave elaborate accounts of the early, and of the contemporary periods and only a sketchy one of the time in between, a proportion that would become typical of many subsequent writers. He was followed by other historiographers writing in Greek until the middle of second century. The older Cato (234–149 BC) was presumably the first to write a historical work in Latin. His *Origines* applied the interest in foundation history not only to the earliest history of Rome but also to the emergence of the cities in Italy and paid particular attention to the unification of Italy. His treatment of political history focused on the justification of his own policy and thus provided the model for the *ex parte* tendency of Roman contemporary historiography. Roman historiography was ethnocentric and it was the product of the leisure-time activity of senators. Their intentions were to demonstrate Rome's cultural equality with the Greeks, to justify her domination over the Mediterranean world, to praise the wisdom and success of the ruling aristocracy, and to take sides with respect to contemporary conflicts. From the late second century onward, a number of Latin historiographical works were composed which followed in their structure the pontifical *annales* (which were published in a full version in 120 BC) and gave a year-by-year account from the origins of the city. They apparently embellished their descriptions of the early republic and especially the 'Struggle of the Orders' between patricians and plebeians by projecting back features of the internal conflicts that had become almost endemic since the tribunate of Tiberius Gracchus (133 BC). Some historians seem to have taken into account certain results of serious antiquarian research, others had no scruples and they invented 'documents.' (It was the Greek author Dionysius of Halicarnussus who, living in Augustan Rome, showed the greatest interest in evidence of an antiquarian nature.) All these Latin 'annalistic' works (as well as the earlier historiographical attempts previously mentioned) are only indirectly known. They were used by Livy (*c.*59 BC–AD 17) who was the first Roman historian without a record of political and military experience of his own. His history covered the time from the foundation of the city to 9 BC. Out of his 142 books, only 35, which reach down to 167 BC (with *lacunae*) have survived. Livy often struggled with the contradictory accounts of his predecessors and the quality of his own descriptions obviously depended on the quality of the sources that was available to him. He did not invent his own versions of the course of events but his work shows the problematic nature of a history totally made on the basis of other, often overtly partisan, historical works that were mostly accepted at face value.

The Thucydidean model of contemporary history was imitated by Sallust (86–35 BC) who after the failure of his political career wrote monographs on the conspiracy of Catiline (63 BC) and on the Roman Wars against the Numidian king Jugurtha (111–106 BC). He interpreted the political crisis of the Late Republic as the consequence of a moral decline following from the abandonment of traditional values. (No other contemporary work on the Late Republic has survived; a comprehensive account of this period is only available in works by subsequent authors such as Appian, second century, and Cassius Dio, third century, who both wrote in Greek.)

Roman Imperial Historiography

Writing contemporary history could become a dangerous job under the Emperors as the fate of the historian Cremutius Cordus demonstrates. Under the reign of Tiberius (in AD 25) he was indicted for *lese majesty* because of the republican sympathies he had shown in his work on the Civil War period (he committed suicide; his work was burnt). The short sketch by his contemporary Velleius Paterculus, a former soldier, covered Roman history from the very beginnings to his own days in only two books and culminated in the panegyric eulogy of the emperor Tiberius.

The historiography of Tacitus (AD *c.*55–120) reflects a new climate of intellectual freedom during the reigns of Nerva and Trajan in comparison to the experience with the tyrannical régime of Domitian (under whom Tacitus had started his public career). His (only partly preserved) works, the *Histories* and the *Annals*, cover the time AD 69–96 and AD 14–68, respectively. Tacitus kept the annalistic form and he paid special attention to the proceedings of the senate. But the form was often at odds with the contents of the works, as the policies of the rulers could not easily be fitted to a chronological scheme that had been adequate for a senatorial régime with yearly changing consuls at the head. Tacitus showed certain nostalgia for the republican liberty without indulging into illusions about returning to a republican constitution. Though claiming to write *sine ira et studio* his personal judgments on rulers (especially the gloomy picture of Tiberius) would serve to uphold the mirror of an honest ruler and his comments on senatorial proceedings reflected his standards for dignified behavior under a monarchy. Tacitus' work with its stress on the psychology of emperors and senators marks the final point of Latin senatorial historiography. (However, subsequently, there was an annalistic history of Rome from the beginnings to AD 229 written in Greek by the senator Cassius Dio.)

Apart from short summaries of Roman history, during the second century serious historiography gave way to imperial biographies. Suetonius (AD *c.*70–140, secretary for the library and subsequently for the imperial correspondence under

Hadrian) gave the history of lives and times of 12 rulers from Caesar to Domitian. They were arranged in a more topical than strictly chronological manner and drew on archival materials as well as traditions stemming from court gossip. Modeled on Suetonius but of a highly fictitious character (with numerous references to imaginary sources) was the *Historia Augusta*, a series of biographies of emperors for the time from Hadrian (AD 117–138) to the accession of Diocletian (AD 285) which was probably produced in the late fourth century by one or more anonymous writers who took on the names of bogus authors.

The Impact of Christianity

The religious tensions of Late Antiquity due to the rise of Christianity only had a limited impact on pagan historiography, which continued to concentrate on short summaries of Roman history. The general restraint from religious polemic also holds true for the work of Ammianus Marcellinus (*c.*330–395), a Greek from Syrian Antioch and former soldier. His history, written in Latin, is otherwise a great exception as he embarked on a continuation of Tacitus that treated the time from Nerva's accession to the throne (96) to the emperor Valens' disastrous battle of Adrianople against the Goths in 378 (only the exhaustive parts on the years from 353 onward have survived).

Christian authors did not enter into a competition with pagan ones on the traditional fields of political and military historiography but they developed models of historical writing that would become the most important innovations until Renaissance times. From the third century they compiled chronicles of universal history, which harmonized the data of biblical, Greek, and Roman history. The chronicle – in Greek – by Eusebius (*c.*260–339, bishop of Caesarea, adviser, and later biographer of Constantine the Great), its Latin translation and continuation (until 378) by Hieronymus and several successor works provided the model for a view of world history from the times of creation. Eusebius, again, created with his *Church History* a new historiographical genre not only with concern to the subject, the history of the Christian 'nation,' but also in his approach: dispensing with speeches, giving bibliographical surveys, and quoting verbatim from letters, official documents, and other sources. The awareness that their theological approach might make their accounts challengeable led Eusebius and subsequently inter alia Socrates and Sozomenus (both early fifth century) to prove thus the accuracy of their factual reports.

Concluding Remarks

Given the complexity and variety of ancient historiography it is almost impossible to summarize its impact on the subsequent Western tradition, especially since the Renaissance, in a few sentences. The most important legacy of Greek historians was the development of a critical attitude to the past, the invention of methods that made it possible to discern between facts and fiction. The shortcomings of their attempts in view of modern eyes should not obscure this unique contribution to the development of the Western mind. The adoption of historiography by the Romans provided the model for constructing the past in the shape of national history. The Christian writers invented ecclesiastical historiography as a subject of its own and a model for universal chronicles and histories starting from the creation. From the Renaissance, Thucydides and Tacitus were taken as the masters of political history, Polybius as the model military historian. With the growing interest in Oriental cultures Herodotus gained a new reputation as a cultural historian. Ancient historiography, which had covered republican city-states as well as world monarchies, was as a whole considered as teaching political and moral lessons of everlasting value (and thus was also of great importance for political theory). The tradition that historiography and antiquarian studies were two quite different subjects survived until the late eighteenth century. There were a vast number of commentaries on ancient texts, collections of inscriptions and coins, learned dissertations on the constitutional, legal, military, and religious institutions of the ancient world but nobody thought of replacing the ancient historiographical works by writing anew narrative histories of antiquity. Gibbon was one of the first to do this and to integrate the results of antiquarian research but he still avoided the period covered comprehensively by ancient historiography and thus started his own narrative only with the second century AD. Doubts about the reliability of ancient historiography, especially of the Roman annalistic tradition, developed in learned dissertations from the seventeenth century. However, it was only in the early nineteenth century, starting with Niebuhr, that a modern historiography of antiquity based on source criticism and systematic researches on the monumental remains of the ancient world began to be composed.

Abstract

This article is a survey of major trends of historical thought and writing since 1970 from a global perspective. The 1970s marked a turning away from analytical social science–oriented historical studies to interpretative cultural approaches. They also saw the inclusion of women, ethnic minorities, and formerly colonial peoples into historical accounts. The end of the Cold War marked a further reorientation in the 1990s and since. For the most part, the focus on culture and on previously neglected segments of the population continued but there was an increased turn away from Eurocentrism to global perspectives in historical writing.

Introduction: Dominance of Social Science Models of History around 1970

The years since 1970 and particularly since 1990 have seen important reorientations in historical thought and historical writing in the West and elsewhere. These changes are closely related to fundamental transformations in the conditions of modern life.

Briefly comparing the intellectual and historiographical situation in the year 1970 with that in 2013, one can distinguish certain dominant trends then and now. In neither case, however, is it possible to reduce historical thought to simple common denominators. Nevertheless in 1970, many historians, at least in the West and increasingly in non-Western countries, were convinced that history was a science, albeit a social science, engaged in recreating a real past as it had actually occurred. Since then, this confidence in the objectivity of science, including historical inquiry, has come under severe attack, as have the notions still dominant in the early 1970s of a coherent process of history. This view of history as a social science replaced an earlier orientation, sometimes labeled 'historism' or the Rankean paradigm, which had been dominant in much of the nineteenth century and well into the twentieth century, which saw history as one of the humanities, a *Geistes-* or *Kulturwissenschaft*, which required a logic of inquiry different from that of the hard sciences, namely, one that takes into account the elements of meaning and intention in human life that cannot be reduced to abstract generalizations. This conception went back to the German historian Leopold von Ranke (1795–1886), who laid the basis for history as a professional academic discipline that viewed history as a special sort of science in the sense that it founded the historical narrative on the critical examination of primary sources. Until that point, historiography in the West from the Ancient Greeks to the Enlightenment, while committed to the truth, basically took the form of rhetorical presentation. Now a sharp distinction was made between the scholarly work of professional historians, committed to the strict examination of primary sources, and 'amateur' historians who were not trained in these rigorous methods.

The new social science orientations went in several different directions. However, they shared certain assumptions. They criticized the older historiography for narrating a history of events, primarily political, focusing on leading personalities in positions of power, and called for a history that proceeded analytically, seeking to examine the social context in which events occurred. While the older historiography relied heavily on philology as a tool for the examination and understanding of texts to fathom human intentions, many professional historians now turned to the neighboring social sciences, sociology, economics, and psychology, and in France also to geography, which analyzed social structures and processes and stressed the interdisciplinary nature of historical studies. It strove for a history that was more comprehensive than that of the conventional narrative political historiography, now including broader segments of the population.

At this point in the mid-twentieth century, there existed a marked difference between the ways historical studies were conducted generally in the West and in Japan, to a lesser extent also in India and China, on the one hand, and in much of Latin America, the Moslem world, and Sub-Saharan Africa on the other. In the former, historical studies had been professionalized since the late nineteenth century and were largely concentrated in academic institutions, universities, and research centers; in the latter, they were generally, particularly in Latin America, the work of gentlemen scholars interested in local or regional history, or of political activists struggling against colonialism in India and Sub-Saharan Africa. In the period between 1945 and 1970, professionalization had set in the latter countries as well. In the Arab world and in Spanish America, universities had a long tradition, but it was only in the mid-twentieth century that research universities in the modern sense were established. In Brazil, the first modern style university was founded in São Paolo in the 1930s. In 1948, the establishment by the University of London of the School of Oriental and African Studies was followed beginning in the 1950s with the founding of research-oriented universities in Sub-Saharan Africa, most notably the University of Ibadan in Nigeria. Although historical studies in the developing countries generally followed an agenda focused on the search for

national identity from a postcolonial perspective, it increasingly took over from the West not only critical research methods but also shared in the general transformation of historical thought in the West.

Social science–oriented history in the period after 1945 ranged from the studies of the material and biological bases of historical life of the French *Annales* in the 1960s to the new historical demography in France and Great Britain, to quantitative urban history and electoral behavior in the United States, to the formulation of quantifiable models of economic cycles in the United States, Great Britain, and France, to a 'historical social science' in West Germany strongly influenced by Max Weber. Nevertheless, despite their differences, they all agreed that history had more kinship with the social sciences than with the humanities. This assumed, as the older historiography had also done, that there was a real historical past that constituted the object of historical studies. It sought to make historical method conform to the methodologies of other social sciences. Hence, it generally preferred different kinds of sources than did the older historiography, for example, hard economic and demographic data. This led Geoffrey Barraclough to comment in a survey written in the 1970s for United Nations Educational, Scientific and Cultural Organization on trends in recent historical studies that

> the search for quantity is beyond all doubt the most powerful of the new trends in history, the factor above all others which distinguishes historical attitudes in the 1970s from historical attitudes in the 1930s. (p. 39)

As we shall see, Barraclough's assertion about the centrality of empirical, quantitative history was, in many ways, already outdated when he made the observation in 1979, and it was not fully correct even then. Quantitative methods were not as dominant as he suggested. They played an important role in the United States and to an extent in France, but very little of one in Germany or yet in India or Latin America.

The Impact of the Annales and Marxism on the Writing of History

Two historiographical orientations that did not fit Barraclough's paradigm of social science history but that had a great influence internationally, including outside the West, should be mentioned here. Possibly no journal had as important an impact in France and internationally in the second half of the twentieth century as the *Annales*, although in French it later contained English abstracts to reach an international public. Peter Burke spoke of a 'French Historical Revolution' initiated by the Annales School. The revolutionary aspect consisted in the school's radical rejection of the manner in which historiography had been traditionally practiced at the Sorbonne with the focus on the narrative of primarily political events. Instead, the Annales sought to abolish the boundaries between the traditional disciplines in order to integrate them into the 'sciences of man' (*sciences de l'homme)* in which historians would work closely not only with sociologists and economists but also with 'scientists' in the fields of linguistics, semiotics, psychoanalysis, literature, and the arts. But it is not correct to speak of an 'Annales Paradigm' as Troian Stoianovich does in his book. The strength of the Annales lay in its openness, its commitment to exploring a large number of methodological approaches. The journal was founded in 1929 by Lucien Febvre and Marc Bloch as *Annales d'histoire économique et sociale*. It built on the ideas embodied in Henri Berr's *Revue de synthèse historique* (1900) which, as the title suggested, advocated a broad historical synthesis of the humanities and the social sciences. This was also the aim of Febvre and Bloch, but they went in very different directions. Bloch's work in *Feudal Society* and in his book on the character of French rural history sought impersonal structures, histories essentially without people, while Febvre in his book on Luther's and Rabelais' religious views focused on individuals. But in both cases, such as in Bloch's *Royal Touch* about the belief in medieval England and France that the king with his touch could heal scrofula, they were concerned less with ideas than with collective mentalities. Thus, Febvre in *The Problem of Unbelief in the Sixteenth Century: The Religion of Rabelais* concluded that Rabelais could not have been an atheist because the structure of the language that set the context for the collective mentalities of his age constrained him to be a believer. The journal, which had been suspended during the war, was reborn in 1946, this time with the subtitle *Economies, Sociétés, Civilisations* to emphasize its interdisciplinary character more strongly. The group now acquired a firm institutional basis with the creation of the *Maison des Sciences de l'Homme* in 1968 in which the key social science and humanistic disciplines were housed under one roof, and soon afterward the *Ecole des Hautes Etudes en Sciences Sociales*, which replaced the Sorbonne as the most important center of historical studies. Fernand Braudel in his book on the Mediterranean (1949, 1966) indicated the direction in which much Annales historiography went. In the place of one historical time, he saw a plurality of times, in this book the stationary time of the Mediterranean as a geographic space (*longue durée)*, the slow changes in social and economic structures (*conjonctures*), and finally the fast time of political events (*événements*), which interested him the least.

The significance of a nondogmatic Marxism on historical thought in Japan, India, Sub-Saharan Africa, and Latin America, and to a lesser extent in Western Europe, should not be underestimated. Marxism–Leninism represented a dogmatic form of Marxist orthodoxy, which dominated in the Soviet Union and in the countries dominated by it and in a somewhat different form in Maoist China, in both cases imposed by authoritarian regimes. By the time the Soviet Union collapsed, Marxism–Leninism had lost much of its credibility. Even in the Soviet Union, a historian such as Aaron Gurevich in *Categories of Medieval Culture* (1971) moved away from historical materialism to a cultural approach reminiscent of that of the Annales. The Polish historian Witold Kula in *Measures and Men* (1970) explored the symbolic meaning of weights throughout Western history. He and other Polish historians contributed regularly to the Annales.

In Western Europe, a thorough revision of classical Marxist theory had already taken place with the Hungarian Georg Lukács' *History and Class Consciousness* (1923), which was withdrawn from publication under pressure from the

Communist International but which continued to circulate in unauthorized editions. Lukács strove to free Marx's theory from economic determinism and stressed the cultural side of Marx's work. Basic ideas of Lukács' critique were taken up by Max Horkheimer, the founder of the Frankfurt School of Critical Theory, indebted to Marx, but freed of the speculative and authoritarian aspects of orthodox Marxist doctrine and extending the critique of capitalism to the realm of culture. Thus, the foundations were laid for what came to be known as Western Marxism. The immediate effect of Western Marxist ideas on historical writing in the West was limited. Marxism increasingly became an academic pursuit located in universities devoid of the firm support it had earlier in the industrial working class movement.

Marxism occupied a much more significant role in the economically less developed areas of the world, India, Latin America, Sub-Saharan Africa, and at the time China, in forms that were inspired by Western ideas but took on different forms that reflected local conditions. Here too, Marxist theorists were mostly located in academic institutions, but there was still a revolutionary tradition that built on Marxist ideas and for some had inspiration in the one successful revolution in Latin America, namely, in Cuba. Important ideas for revolutionary movements in these countries came from the revision of orthodox Marxism by the Italian communist Antonio Gramsci, whose writings in Mussolini's prisons in the 1920s and 1930s only became known in the 1960s. In them he explained the defeat of the communist workers movement in Italy in terms that involved factors insufficiently developed in traditional Marxist social theory. A critic of the orthodox Marxist reliance on an economic analysis of society, he maintained that the strength of capitalism rested ultimately on its cultural 'hegemony' by which control was maintained not solely by political and economic coercion over the working population but through a culture in which the values of the dominant classes were imposed and accepted by the masses of the population. According to him, revolutionary action required a counterculture challenging the dominant values of the capitalist classes. But Gramsci also criticized the orthodox Marxist focus on an industrial proletariat and expanded the idea of the working classes to include broad segments of the working population and the poor, to which he referred as the 'subaltern' classes, in an unevenly economically developed society as the Italy of his time. His analysis fitted much more closely the condition of unevenly developed countries, especially Latin America, than did orthodox Marxist doctrines.

Challenges to Social Science Approaches to History: Postmodernism

The widely held confidence in social science and modernization was radically challenged in the 1970s and 1980s, most vocally by postmodernist philosophers and literary critics, but more quietly also by historians, particularly cultural historians. While it is difficult to reduce these critics to a common denominator, they agreed in repudiating one assumption that they considered to be central to the modern historical outlook, namely, the belief in the coherence and continuity of world history, the invention of a 'master,' or 'metanarrative' (Lyotard) that sees history as an onward development to the modern Western world with its promise of enlightenment, emancipation, and well-being for the world as a whole. Practitioners of the established historiography, critics charged, had overlooked the close relationship between Western progress and imperialism abroad and the consolidation of power relations based on race, gender, and class at home, taken for granted in their view of history. But history, they argued, had no coherence, thus eliminating the possibility of a grand narrative and opening the way to innumerable separate histories.

Closely related to this critical view was the rejection of the possibility of objective historical inquiry into the past. According to Peter Novick, the idea and ideal of objectivity that lay at the very center of the profession ensured "the separation of history from fiction" (pp. 3–4). For Hayden White, however, history was just another 'linguistic mode' based on the aesthetic and moral preferences of the historian, and no more objective than fiction. Postmodernist philosophers further noted that the assumption that behind appearances lies a solid, foundational real world is erroneous. Thus, historical consciousness, according to Keith Jenkins, is "just one more foundationless, positioned expression in a world of foundationless, positioned expressions" (p. 6).

The Turn to Cultural History and the Return to Narrative

Such extreme epistemological relativism was largely restricted to literary theorists such as Hayden White, Roland Barthes, and Jacques Derrida. Few practicing historians, however, would agree that there are no criteria of objectivity. Historians continue to hold that historical works, in contrast to historical novels, must proceed from research that requires standards of objectivity shared by the scholarly community. Postmodernism had reflected a general mood that was shared by many historians. Part of this mood was a general skepticism regarding the nature and quality of modern civilization and its science, the recognition that the historical science of the West, whether in its historicist or its social science form, had legitimized relationships of power in which a middle and upper class elite had been privileged at the expense of the broad masses of the population, including women and the non-Western world. Thus, by the 1970s, the old scientific ethos of the social science historians was shaken. In l979, in a now famous article, Lawrence Stone noted that in the 1970s a change had occurred in the way history was viewed and written. The belief, central to social science history, that "a coherent scientific explanation of change in the past" (p. l9) was possible, was widely rejected. In its place there emerged an interest in the most varied aspects of human existence, accompanied by the conviction that "the culture of the group, and even the will of the individual, are at least as important causal agents of change as the impersonal forces of material output and demographic growth" (p. 9). Yet, although Stone emphatically rejected the illusion of 'coherent scientific explanation,' he nowhere suggested that historical narrative should surrender its claim to rational inquiry and realistic reconstruction.

The Impact of the Linguistic and the Cultural Turn on the Writing of History

The new directions that historical studies took must be understood within the context of the political climate of the 1960s, which saw the emergence of a women's movement, the rise of ethnic consciousness, the struggle for racial equality, anticolonialism, and environmentalism, which all pointed at the inadequacies of the social and economic order of an industrialized, modernizing Western world and the social science that served it. This marked a significant reorientation in historical writing, a new focus on the experiences of women and of marginal parts of the population, homosexuals, ethnic minorities, and colonial people, as well as of other nonconformist groups. This reorientation has to be understood within the context of the institutional changes in higher education, the rapid expansion of the universities, the changes in the student body with the entrance of segments of the population that had been underrepresented before, and the increasing presence of women in the profession. These changes were most pronounced in the United States but also occurred elsewhere. This deeply affected historical thought and writing. It also included a widespread critique of the established forms of social history, and incidentally also of traditional Marxism, which were criticized for concentrating on anonymous social processes, and producing a history without people. They sought a turn away from what they termed macrohistory to microhistories, which dealt with the life experiences of common human beings.

While few social historians could be identified as postmodernists or Marxists, certain central ideas of postmodernism and of cultural Marxism impacted a great deal of writing in social history, which increasingly moved in the direction of cultural history. The idea of the unity or direction of history gave way to the concentration on small units on the local level. The subjects of the new culturally oriented social history were most often "the lives and feelings and behavior of the poor and obscure rather than the great and powerful" (Stone, 1979: p. 19). Anthropology and semiotics replaced sociology and economics as the key auxiliary sciences of social history. But anthropology underwent a sea of change. While classical anthropology, e.g., that of Bronislaw Malinowski in the l920s and 1930s, had tended to a static analysis of 'primitive' and 'timeless' societies, anthropologists had now become increasingly historical in outlook, recognizing like Pierre Bourdieu that all, even the most 'primitive' cultures, evolve and that modern societies also are proper subjects of anthropological study. In Germany, this anthropological turn in the l980s took the form of *Alltagsgeschichte* (history of everyday life) (Hans Medick, Alf Lüdtke, and Lutz Niethammer), in Italy of the microstoria movement (Carlo Ginzburg and Giovanni Levi) around the journal *Quaderni Storici*.

With the turn to cultural history and cultural anthropology, the scope of history was substantially broadened. The turn to microstoria also carried with it a new emphasis on the history of emotions. The Annales had from the beginning of the school explored what they considered to be collective mentalities. They now examined changing attitudes on death, childhood, and sexuality, first with a quantitative collective approach, then with a focus on individual emotions and attitudes, as in Emmanuel Le Roy Ladurie's story of the heretic village Montaillou. The Annales launched a major study of book production and reading habits; microhistorians like Carlo Ginzburg and Hans Medick did this on an individual and local level.

The gap created between social and cultural histories began to close markedly in the 1980s and 1990s. In the 1980s, feminist historians, dissatisfied by the secondary status of women's history ('herstory') in a profession dominated by seemingly masculinist prescriptions of historical practice, turned to gender as a "useful category of historical analysis" (Scott). By emphasizing the culturally and socially 'constructed' nature of sexual identity, gender, a term borrowed from linguistics and literary criticism, revealed hierarchies and relations of power in societies mediated through language and discourse. Thus, postmodernist textual analyses of gendered meanings were used to challenge not only established conventions of sex, bringing to light their contingent nature, but also social institutions and even scholarly conventions of historical practice, which revealed a masculine bias. Natalie Davis is a prime example of this merger of social, cultural, and gender histories. Beginning with a focus on the experience of women in an early modern French social and cultural context, she expanded her scope to include the interplay of culture and religion between the European and the North African shores of the Mediterranean through the lens of a sixteenth-century Moslem. More recently, she turned to slave cultures with roots in Africa in eighteenth-century colonial Suriname.

The Impact of the Cultural Turn on Marxist Historiography

Gramsci's writings deeply influenced the Subaltern Studies group in India formed in the 1980s. Like Gramsci, whose term subaltern they had taken over, they called for a history from below which they saw the subaltern classes as potentially active revolutionary forces as in *The Elementary Aspects of Peasant Insurgency*, the classical monograph by Ranajit Guha, the founder of the group. The Studies laid foundations for a postcolonial historiography, which, however, distanced itself from the political leaders of the independence movement in India who came from a ruling elite, which in their opinion merely replaced the former British ruling elite. They called for a historiography in which categories of class, ethnicity, and gender would be integrated, but held that a Marxist conception of class conflict misses the analysis of power to which Foucault had pointed as an infinitely complex network of micropowers that permeate every aspect of social life and culture. At this point, they went further than E.P. Thompson, to whom they also felt indebted, in the direction of culturalism; the concept of subaltern replaced that of class, while subaltern agency replaced class consciousness, and because they were sympathetic to the postmodern critiques of power, subalternity became a condition embedded in and resulting from discourse.

Perhaps no book had as great an impact on the reorientation of Marxist social history, not only in the English-speaking world but also beyond, as E.P. Thompson's *The Making of the English Working Class* (1963). Thompson maintained the concept of class and the notion that "the class experience is largely determined by the productive relations

into which men are born – or enter involuntarily" (p. 9). But he stressed that class must be seen not as a 'structure,' or even a 'category' but as something that in fact happens in human relationships (p. 9). The English working class was thus not primarily the product of economic forces as it had been in the 'Communist Manifesto' or in structuralist, functionalist sociology, but an active agent, coming from a specific cultural tradition, which made itself as much as it was made. Hence his reliance on qualitative elements that made up a culture such as literature, art, folklore, religion, and symbolism. Moreover, he emphatically rejected the orthodox Marxist notion that sees the past as a step to the future.

Yet Thompson's historiographical approach soon came under attack from cultural Marxists who argued that he had not broken sufficiently with classical Marxist notions of class. Even if he saw class in terms of culture, they charged that his approach to culture still focused on an industrial working class in which those not directly linked to the industrial work process, including women, played little of a role. They began to ask "why did he (Marx) give so little attention to the experience of women and colonial peoples in favor of the experience of the European, white, male, working class?" (Wickham, 2007: p. 3), which became the concern of much of social history.

Reorientation after 1990: Toward a Global Academic Community

The main currents that have been discussed with the turn to culture and the opening of history to women and portions of the population that had been previously neglected continued to shape historical writing after 1990. Nevertheless, just as the political currents of the 1960s deeply influenced historical thought and writing worldwide, so the changed political constellation of the 1990s after the dissolution of the Soviet empire between 1989 and 1991 and the end of the Cold War presented historians with new challenges. The universal peace that the American political scientist Francis Fukuyama predicted in his essay, 'The End of History?,' in 1989, in which he foretold a worldwide, even if gradual, acceptance of American style free enterprise and democratic institutions after the collapse of Soviet communism, did not materialize in the way he had foreseen. Samuel Huntington who in *The Clash of Civilizations* had written of an irreconcilable conflict between Islamic and Western – and incidentally also Chinese culture – operated with very simplistic notions of a timeless Islam as a unified culture, overlooking the divisions in the Islamic world, its history, the effects of modernization, the role of economic factors, and finally the interrelation between Islamic societies and the modern West. Huntington's analysis would leave little space for the Arab Spring of 2011.

On one level, Fukuyama's prediction proved to be at least partly true, namely, as to the extension of Western style capitalism to large areas of the world as part of a process of globalization. This period was marked by what appeared to be the inevitable victory of corporate capitalism, not only in the West where it had begun well before 1989, but also in countries like China and somewhat later in Vietnam, which proclaimed themselves to be Communist. If the first decades after 1945 had been marked by a general prosperity in the West and in Japan accompanied by a higher living standard for the bulk of the working population, since the 1970s much of this was reversed with the stagnation of wages and dismantlement of basic parts of the social network, without any effective challenge from the general population. Marxism as an economic or political challenge was effectively dead, at least in the West. The financial crisis of 2008 pointed at the dysfunctions of capitalism without resulting in any substantial reforms; the Occupy Wall Street movement of 2011 contributed to an awareness of the growing social injustices created by corporate capitalism, but was supported by an ineffective small minority. Nor, as Fukuyama had wrongly foreseen, did the emergence of capitalist economies usher in a process of democratization. In China, for example, and also elsewhere, the introduction of capitalism was accompanied by a stringent dictatorship, and by a semi-dictatorship in Russia.

What did take place was a process of globalization that not only involved the worldwide transformation of the economy, intensified by the new information technology, but also was accompanied by the increasing homogenization in everyday life, in consumer behavior, patterns of urbanization, metropolitan architecture, popular culture in film and music, and the relations of the sexes and of the generations. Nevertheless, globalization took on heterogeneous forms on the social and cultural level, reflecting local circumstances and heritages. And these generated resistance against the effects of globalization on traditional ways of life, which, not seldom, involved violence.

More than in the period before 1990, but beginning already then, an international scholarly community came into existence, as non-Western scholars, foremost Indian, Middle Eastern, Latin American, and increasingly historians from Sub-Saharan Africa, occupied important academic positions at American, British, and Australian universities and to some extent at the *Ecole des Hautes Etudes en Sciences Sociales* in Paris. It is an important fact that the language of international communication was increasingly English. Scholars in the non-Western world had now increased input into these discussions, including those inspired by the Indian Subaltern Studies. In return, Western, particularly North American and British scholars cooperated closely, as to an extent they already had before 1990, with scholars in Latin America, Africa, India, and East Asia, so that studies in many fields have been increasingly internationalized. But there are still very definite limits to international exchanges. English language literature is widely read in the original or in translation. Many of the important works in history or related social science and humanistic disciplines are translated from English into non-Western languages, as are important French and German books and articles. But very few Chinese, Japanese, Korean, Farsi, Turkish, or Arabic writings have been translated into English. Thus, for example, in recent years 13 times more books were translated from English into Chinese than vice versa (Sachsenmaier, 2011: p. 42). The result is that international communication is still dominated by Anglo-America, with little awareness of the theoretical discussions outside the West, with the exception of Anglophone scholarship in India. And much history continues to be written in national languages for national audiences. To be sure, in recent years the international communication

among historians across the world has been facilitated considerably by the advance of computer technology and the wide use of the Internet.

Major Historiographical Trends after 1990

We can generally identify several major trends in historical writings across the world after 1990, which tend often to be interrelated: (1) the move away from a focus on national history to comparative transnational and also global approaches, (2) a shift away from a Eurocentric perspective on history to one that recognizes the significance of non-Western cultures and the interaction between the West and these cultures, (3) greater interdisciplinarity as part of comparative studies, and (4) an expansion of the scope of history to include women and sections of the population who previously had been marginalized. Beyond this, women and ethnic minorities increasingly entered the profession, particularly but not only in the United States, giving impetus to women's, gender, and ethnic studies. At the same time, the extreme cognitive relativism identified with the postmodern linguistic and cultural turns lost in significance (Spiegel) as its insufficiency in understanding the complexities of the modern, global world became clear. As seen, the forms of relativism that reduced history to a form of literary fiction had only a limited effect on how history was actually written and its advocates were found largely among academic literary scholars, not among historians.

However, while these are important trends in the ways history is written today, there is no new paradigm that defines historical studies. In fact, there is not only considerable diversity but there are also continuities with traditional ways of writing history. Although much history turned away from the concentration on the nation state, the nation state survives in historical writing, even if the definition of what constitutes a nation underwent changes. The turn toward transnational and global approaches was perhaps most developed in two countries with very different historiographical traditions, China and the United States. American historians had for a long time been interested in the world outside of America, but for a long time from a Western orientation – this meant Europe, particularly Western and Central Europe – now they increasingly dealt with the rest of the world, including former colonized areas such as Latin America. This involved a move away from the older conceptions of the cultural and even racial superiority of the West. Chinese historiography in the modern period had never been unaware of the histories of the Western world, as had been widely but incorrectly presupposed. In fact, world history had centered on the West, although now it also paid greater attention to the so-called developing countries (Sachsenmaier, 2011: pp. 171–231). It is striking that this tendency accompanied the economic modernization of China. Not withstanding the Marxist ideology professed by the state, much of historical writing in China since the 1990s was far removed from Marxist assumptions. At a time when conceptions of modernization came increasingly under scrutiny in the West, and both Western scholars like Shmuel Eisenstadt and Indian historians such as Dipesh Chakrabarty argued that there were multiple modernities, differing in the non-Western world from the European model, Chinese historians often tended to identify modernity with its Western form.

The Transformation of the Concept of the Nation

Notwithstanding the continuing concentration on the nation in much historiography throughout the world, the concept of the nation underwent changes. Reflecting the increasing number of ethnic minorities in post-1990 Western and Central Europe and in Anglo-America, as well as Australia and New Zealand, many historians no longer viewed nations as homogeneous, but as heterogeneous, multicultural societies. Similarly, it was now argued that the widely held view of Europe's coherence overlooked the various social and cultural strains transcending the borders that compose it. The same, of course, also applies to Latin America, Africa, and major Asian regions. Latin American historians became increasingly aware of the diversity between and within its regions and sought to reconstruct what they called the "peculiarities of Latin America," adapting a formulation from E.P. Thompson. There was an increasing tendency not only to write but also to teach national history from a multicultural perspective. In the United States, the *National Standards for United States History* and the *National Standards for World History* stressed the pluralism of the ethnic cultures that make up the United States and the role of minorities and women in history, an approach that permitted global intercultural comparisons. In India, the legacy of the Subaltern Studies meant the recognition of the need to go beyond unitary interpretative frameworks, such as that of the nation state. It was acknowledged that nationalist histories had evolved as anticolonial histories, yet from the perspective of the Subaltern Studies group much of this anticolonial historiography had merely replaced British elites with Indian elites ignoring the large subaltern sections of the population as active agents in the anticolonial struggle. This did not mean a decline in nation-oriented histories. Historians in non-Western regions have continued to delve into the distinct cultural traditions of a region's past in order to deepen their understanding of the interplay between tradition and modernity and past and present. Yet more recently, historians have sought to avoid dealing with national units altogether, to insist on relationships, transfers, and interactions independent of national lines in what French historians have recently called *histoire croisée* or 'entangled histories' (Werner, Zimmermann). Here, one may also mention Gerhard Haupt's and Jürgen Kocka's recent reader on comparative transnational approaches.

The Reorientation of Historical Writing and the Turn from National to Global History

It was in 1990 that as a consequence of the process of globalization the term 'global history' first became widely used. To begin with, it was interchangeable with a much older term, 'world history.' Attempts to write world history had a long tradition in Chinese, Islamic, and Western historiography. Ranke still undertook to write a world history that concentrated exclusively on the Western world, as did other nineteenth- and twentieth-century historians who dealt with the non-European

world in an age of imperialism and colonialism mainly in its relation to the West. The last major 'universal history' that sought to encompass the whole world was the English *Universal History* launched in 1736, thereafter largely replaced by Eurocentric or nation-oriented histories. This changed markedly after 1990 when the study of world or global history first received a firm professional basis with the foundation of the World History Association and the launching of its *Journal of World History* in 1990. In 1991, the bilingual English and German *Comparativ: Zeitschrift für Globalgeschichte* followed and in 2006, the *Journal of Global History*. Again, the United States and China, and to an extent Japan, became the key centers for the pursuit of world or global history, directed not only to research but also to instruction. In the United States, undergraduate courses in Western Civilization, which had been widely introduced shortly after World War I, now gave way to courses in world history. In China, institutes of world history were established. For the first time after 2006, a number of histories of historiography appeared, which encompass historical writing throughout the globe from its beginnings. Going beyond this, a small circle of American historians pursued what they called Big History (Christian, Spiers). While historians traditionally had considered the past prior to writing as prehistorical, they now wanted to go back to the very beginnings of the universe, the Big Bang, and trace it through the creation of the Solar System, the first appearance of human life and its evolution to the modern period. Such an approach had to break with the established methods of historical inquiry that focused on humanity. It wished to link history more closely to the natural sciences and give it a material basis, but inevitably involved large-scale speculation. A more solid attempt to link history to a natural setting was contained in William H. McNeill's early contribution in *Plagues and Peoples* (1976), which examined the impact of disease on human history in an environmental context.

In fact, since the 1970s, increasing attention has been given to environmental history reflecting the growing popular awareness of the dangers posed to the environment. First centered in the United States, environmental history was soon pursued throughout the world, particularly in India and Latin America. Scholars writing from an Indian perspective focused on the politics of environmental ideas, manifested in the colonial context allegedly as a movement to protect native wildlife over native people and in the postcolonial period a growing polarization between the environmentalism of the affluent and the environmentalism of the poor (Guha). In the United States, J. Reill in his environmental history of the world in the twentieth century stressed that traditional historiography has failed to understand the central role that the unparalleled human manipulation and neglect of the environment with its catastrophic consequences has played in the past century.

Marxist Historiography, the Annales, and the Historiography of Politics after 1990

A brief comment on the role of Marxist ideas in historical writing after 1990: The collapse of the Soviet Union and the communist regimes in its Eastern European subject states carried with it the definite demise of Marxism–Leninism as a historical doctrine. It became increasingly evident that the Marxist model of historical development had become increasingly irrelevant in the contemporary world. But, as seen above, Marxism–Leninism had long before lost its intellectual credibility and Marxist theory in Western Europe had moved away from Marxist orthodoxy to stressing the role of culture and recognizing that the development of a postindustrial capitalism had created social realities that no longer corresponded to Marx's conception of industrial economies with its clearly delineated bourgeois and proletarian classes. Marxism, moreover, had lost its foundation in a revolutionary proletariat, which no longer existed in the form Marx had conceived it. In the economically less evenly developed societies with large preindustrial agrarian populations, the classical Marxist analysis of classes fitted even less. After 1990, Marxism as a revolutionary movement was restricted to unevenly developed areas of Latin America and India. Elsewhere, but also in Latin America and India, the advocates of Marxist social theories were largely intellectuals generally found at the universities; Marxism became one philosophical orientation among others. But while Marxist ideas continued to occupy a role in the historiography of non-Western countries, it did so more in its Gramscian than in its orthodox form. In the West, historians who had long identified themselves as Marxists such as Perry Anderson, the editor of the *New Left Review*, and Eric Hobsbawm concluded that Marxism in the form in which they had once understood it was certainly dead, even if it still had an important critical function. The *History Workshop*, which in 1976 as a Marxist-inspired journal had carried the subtitle *Journal of Socialist Historians*, changed in 1982 to *Journal of Socialist and Feminist Historians*, in 1995 dropped the subtitle altogether with the explanation that "the political conditions in which we work have changed almost out of recognition … since we last amended our mast head."

This shift away from older positions occurred not only in Marxist but also in non-Marxist historiography, as in the case of the Annales School. The Annales had pioneered an openness to many areas of social existence that had long been ignored. Yet there was something provincial about a great deal of historiography carried on its name. Its turn away from political history went so far that it failed to deal with the decisive role that politics has played in its social and cultural contexts. Annales studies focused on the European, for the most part the French Middle Ages and the French Ancien Regime, largely giving little attention to political aspects. Bloch, Braudel, Pierre Chaunu, and Denys Lombard to be sure pursued a broader transnational perspective and Maurice Agulhon and Marc Ferro turned to the political world of the nineteenth and twentieth centuries, respectively. Only in the 1930s did the Annales confront problems facing the world at the time and extending to the non-Western world. In the 1990s, they recognized its limitations when they dropped the subtitle *Economies, Sociétés, Civilisations*, which they had used since immediately after World War II, which had consciously eliminated politics as a prime concern of history and downgraded the role of narratives. The journal's new subtitle *Histoire Sciences Sociales* reflected the openness to Western as well as non-Western societies and cultures that marked a great deal of contemporary historiography. Similarly, *Geschichte und Gesellschaft*, which in

the 1980s had given increased attention to cultural aspects of history, since the 1990s turned to transnational, global topics.

And the Annales gave important impulses to the role that memory occupied in the reconstruction of the historical past. Of course, memory, false or true, had always served the formation of collective identities. Already Maurice Halbwachs, a student of Emile Durkheim, had sought to establish the connection between a social group and its collective memory, which also played a significant role in the work of Lucien Febvre and Marc Bloch. But it was only since the 1980s, and particularly since the 1990s, that memory began to occupy a very central place in historical thought. A key work was the seven-volume *Lieux de Mémoire* (Sites of Memory), published between 1986 and 1993, which proceeded on the assumption that the history of the French nation could not be adequately represented by a narrative based on documentary evidence, but involved the images that the French had of their past. Thus, sacred sites, festivals, myths, songs, literature and art all played a role in fashioning national consciousness as it was remembered. But from a very different perspective, memory played a crucial role in the reconstruction of the horrors of the twentieth century, particularly the Holocaust, as they were reflected in the memories of victims. In Russia, the Memorial group sought to reconstruct what happened under Stalin on the basis of the memories of survivors.

This leads us to a consideration of the role of political history since the shift of historiography to cultural studies. Political history was by no means dead and a good deal of it continued to pursue traditional topics with traditional methods of relying on archival documents. But much historiography of politics was affected by the cultural trend. Labor, workers, slaves, natives, and women became the focus of a growing body of historical writing by academic historians. What occurred now was not the abrogation of political history but the cross-fertilization of political, social, and cultural history. Yet it is striking that the fifth volume of *The Oxford History of Historical Writing* (2011), the most comprehensive and up-to-date survey of historical writing since 1945, reflecting the disdain of many cultural historians for politics, does not include a chapter on the writing of political history and largely ignores the topic.

Conclusion

A very fundamental reorientation of historical studies accompanied by a reorientation of historical consciousness took place in the course of the 1960s, leading to an increased openness, reflecting the increasing attention paid to women and to other segments of the population that had previously been marginalized. As the central role of Europe, and more gradually also that of the United States, declined in the postcolonial age, history also assumed an increasingly global perspective. The collapse of the Soviet empire did not fundamentally change this in the period after 1990. Although these years saw the expansion of Western capitalism and a growing Western influence on social and cultural aspects, it also witnessed an increasing consciousness on the part of the non-Western world of their indigenous traditions resulting not in homogeneity on a global level but on diversity in an increasingly modernized world. This, as seen, was also reflected in approaches to history. There were two shifts in emphasis in historical writings, even if they did not constitute a fundamental reorientation. One was a growing global perspective accompanied by a decline, but not an abandonment of national history; another an awareness of the role of politics, which had been played down and too often totally ignored by historians committed to the cultural turn. Moreover, with the turn to transnational and global histories, which inevitably dealt with structures and processes, some historians tended to turn again to more analytical social science approaches that had been rejected by many cultural historians since the 1970s.

Historical Thought and Historiography: East Asia

Masayuki Sato, University of Yamanashi, Kōfu, Yamanashi, Japan

Abstract

Historiography has been one of the primary cultural undertakings in East Asia. This is in contrast to the cultures of Europe, India, and Islam, where the concentration of cultural power has not been fixed in history. The purpose of writing history in East Asia was based on the Chinese philosophical premise that historical facts constituted the only certain and immutable reality, because people could not alter that which had already happened. This idea took history to be the axis of East Asian civilization. History set itself apart from political affairs, stood above administration, and deemed itself the foundation for all human judgment.

The art of recalling the past has developed very differently in Europe and East Asia. Since the time of Herodotus and Thucydides, Western historiography has centered on histories written by individuals for individuals, whereas East Asian historiography has since ancient times pivoted on public historiography. This distinctive characteristic of East Asian historiography could be described as 'publicly sponsored history', and constitutes a tradition that continues today as the *basso continuo* of culture.

'East Asia' as a historical and cultural concept, comprises present-day China, Japan, Korea, and Vietnam. In these areas, history developed around China, which overwhelmed the peripheral countries with its physical size, and political and cultural ascendancy. This historic East Asia has been termed 'the Chinese world order' or a system of international relations with China at the center. The system reached Korea and Vietnam in the early Han period (202 BC–AD 9), and Japan in the AD first century.

This sinocentric system also formed the common cultural heritage of East Asia: the classical Chinese language and Chinese writing system, the Confucian social and familial order, Buddhism through Chinese translations, the legal and administrative systems, and the art of historiography. The peripheral states of the East Asian world might also be called sinographic cultures, in the sense that they used classical Chinese as a common language. This is, in a sense, comparable with the use of Latin in medieval and early modern Europe (Fairbank et al., 1989).

Role and Purpose of Historiography

For the most part, the task of historiographical compilation in East Asia was traditionally a state-run project. The 'official history' produced by that compilation, along with materials collected for the purpose, constituted the core of East Asian historiography. Historiography may be said to be the primary cultural undertaking in East Asia. This is in contrast to the cultures of Europe, India, and Islam, where the concentration of cultural power has not been fixed in history.

For 2000 years Chinese historiography centered on the 'official history' compiled by each successive dynasty as a state enterprise. Later generations positioned the *Shiji* (*The Records of the Grand Historian*) by Sima Qian (145–*c*.86 BC) as the first official history. Since then 24 other official histories have been compiled. A characteristic of these official histories is that they have an encyclopedic tinge; that is, the body of the work originated by Sima Qian endowed the entire culture, its politics, economics, society, culture, technology, etc., with a unified structure. History was written as a means of comprehensively describing such a world system (Watson, 1958). As such, historiography in East Asia is perhaps equivalent to 'primary cultural undertakings' such as Biblical commentary and the *Corpus Iuris Iustanianus* in the West, the *Laws of Manu* in India, and the *Koran* in the Muslim world.

The purpose of writing history in East Asia was based on the Chinese philosophical premise that historical facts were the only certain and immutable reality. Chinese metaphysics was not premised on a revealed religion based on the existence of a unique, almighty God, like Judaism, Christianity, and Islam. Rather, it took the world as an ever-changing phenomenon, as presented in the *Yijing* (*The Book of Changes*). Therefore, it sought immutable reality in history, because human beings could not alter that which had already happened. This idea took history to be the axis of East Asian civilization.

This culture of history later spread throughout East Asia in tandem with Confucianism, creating a common historical culture throughout East Asia. The proclamation of this philosophy may be found in Confucius' statement that "All the empty words I want to write down are neither so clear nor so startling as seeing their meaning in action" (*Shiji*).

The Chinese had developed their own way of constructing an immutable past. In China and Korea, it was standard practice that, once the state's historical compilation bureau had completed compiling the official history of the previous dynasty, the bureau destroyed all the sources it had collected. This was to prevent the revision or rewriting of the official history, for once it was published by the government, the history itself took on the character of a sacred text. The most certain way to endow the official history with the imprimatur of authority was to destroy the sources on which it had been based. During the Korean Chosŏn dynasty (1392–1910), for example, the source materials were burned after use. When that was done, the account embodied in the official histories became the facts of history.

 http://dx.doi.org/10.1016/B978-0-08-097086-8.62029-9

In this fashion, East Asian cultures preserved the ideal that history was the sole immutable basis for human judgment. The biographies that comprise over half the material in the official histories maintained this tradition of objective narration in their own way. In the biographies, as in other sections of the official history, the texts first set forth what they believed to be 'fact'; this was followed by additions by historians who added their own evaluation. This vast corpus of biographies forces us to consider why the historians believed biography to be a necessary part of a history. The answer is that in a culture lacking a unitary supreme being, the records of the lives of eminent individuals become the only true sacred texts (Yoshikawa, 1963).

Historical Objectivity

The East Asian tradition was maintained by seeking objectivity in historical narration in the lives of the historians who wrote it even more than the narration itself. The following text presents an instance of a fifteenth-century Korean historian as a distinguished figure.

It is recorded that in 1431, as the compilation of the *Taejong sillok* (*the Veritable Records of King Taejong*) was nearing completion, his successor King Sejong (1418–50) asked the compilers to show him their work in advance. "In the previous dynasty, every monarch personally reviewed the veritable records of his predecessor; but King Taejong did not review the Veritable Records of King Taejo." Sejong's senior ministers replied that, "If Your Majesty were to review [the work in progress], later monarchs would surely revise [the historians' work]. Then, [future] historians would suspect that the monarch might look at the draft, and they would inevitably fail to record the facts completely. Then, how would we transmit [facts] faithfully for the future?"

'History' in modern East Asia is generally parsed with the two-character compound Chinese word *lishi* (Japanese, *rekishi*; Korean, *yoksa*), but until the middle of the nineteenth century, it was expressed in the single-character term *shi* (Japanese, *shi*; Korean, *sa*). This word *shi* itself originally denoted the historian himself, and only later, by analogy, did it come to refer to the product of the historian's craft, the written work of history itself. This is particularly important when we note that in the languages of Europe, it was precisely the reverse: the word 'historian' was formed to refer to the maker of the written 'history' (Sato, 2007). It is thus not surprising that historical consciousness in East Asia tends to focus far more on the attitude of the historian than on the actual works of history themselves.

Development of East Asian Historiography

China

In China, Sima Qian substantially established the tradition of Chinese historiography by inventing his own format for compilation. He succeeded his father as the grand historian of the Han emperor, and with his access to court archives he was able to complete the *Shiji* (*The Record of the Grand Historian*) in 130 volumes. It covers a history of 3000 years from the (legendary) Huangdi dynasty to his own period, and covers China and Central and South Asia. The format consists of five sections: 'Benji', or imperial annals (12 volumes); 'Biao', a chronology of the successive dynasties (10 volumes); 'Shu', treatises on economy, technology, astronomy, etc., (8 volumes); 'Shi-jia', annals of feudal states and nobles (30 volumes); and 'Liezhuan', biographies of famous persons and foreign peoples (70 volumes). Sima's format is encyclopedic in nature, systematizing the world in a single, unified structure; his historiographical format dominated East Asian historiography until the mid-nineteenth century.

Ban Gu (32–92 BC) followed Sima Qian's work, but limited himself to the history of a single dynasty, which he completed as the *Hanshu* (*History of the [former] Han dynasty*). His practice, in which each Chinese dynasty compiled the history of its predecessor, became standard for all succeeding official histories. During the Tang dynasty (618–906) this historical culture truly flourished, as history became an independent subject in the Chinese classification of learning (McMullen, 1988). Historians were closely linked with governmental bureaucracy and their team method of compilation started in this period and continued until the twentieth century.

A new format for compiling historiography was proposed by Sima Guang (1019–86) in his 294-volume *Zizhi tongjian* (*The Comprehensive Mirror for Aid in Government*) in 1084. This was an extensive historiography that employed the method of chronological order to help readers find certain historical events through dynasties. It covers 16 dynasties, for a total of 1362 years, and includes information from dynastic histories, chronicles, biographies, novels, etc. It is necessary to refer here also to the Hanxue (the Han School), the development of which established historical study based on textual criticism of historical documents in the Qing dynasty. Qian Daxin (1728–1804) was one of the great figures among them, whose *Nianershi kaoyi* (*Verification of the text of the 22 histories*) was an examination of characters and language, dates and places, genealogies, and institutions in the text of the 22 official histories.

Japan

The idea of official history spread from China to the other East Asian countries. These nations compiled their own official histories, modeled on the Chinese format and written in classical Chinese, not in their native languages.

The first Japanese state historiography was the *Nihon shoki* (*The Chronicle of Japan*, 720) compiled by Prince Toneri, and modeled after the Chinese format. It covers the period from the Age of Gods to the end of the reign of Empress Jitô (686–697), arranged in chronological order, in annalistic form. Toneri's historians used history as a forum to establish Japanese national identity and consciousness. This is in marked contrast to the *Kojiki* (*Record of Ancient Matters*, 712) commissioned by Ôno Yasumaro, which was based on a transcription of oral tradition (Sakamoto, 1991).

This tradition continued until the late nineteenth century. The *Honchô tsugan* (*Comprehensive Mirror of Japan*, 1644–70), compiled by Hayashi Razan and his son Hayashi Gahô,

followed the tradition of official histories sponsored by the Tokugawa shogunate and the *Dai Nihonshi* (*the History of Great Japan*, 1657–1906) compiled under the support of the Mito clan.

Apart from these traditions, Japanese historiographical writings included auxiliary sciences as bibliography, classics, textual criticism, and philology, which had developed in Japan to the same levels as in the West by the nineteenth century. Such undertakings in Japan originated when variant readings or conflicting readings of the *Chronicle of Japan* (720) were handed down intact to posterity. In this important respect, China differed markedly from Japan. In China, history was transmitted as an authentic, authoritative text, which admitted no variants. This difference is richly illustrated by the work of Hanawa Hokiichi (1746–1821). His *Gunsho ruijû* (*Classified collection of Japanese classics and documents*), begun in 1779 and still in progress, first appeared in 1819, with 1270 titles in 530 volumes; another 2103 titles in 1150 volumes appeared in 1822. The objective was not to establish the authoritative text and obliterate the others, but to make available all the variant texts, which later generations might judge. This collection compares favorably with such European endeavors as the *Monumenta Germaniae Historica*, the *Rerum Italicarum Scriptores*, etc. (Maruyama, 1974).

The Meiji government, established in 1868, which was responsible for the restoration of the emperor as the supreme sovereign and which led the subsequent modernization of Japan, continued the tradition of 'official histories' when it founded the Office for the Compilation of National History (Shushikyoku). At first, the aim was to create an official history of Japan, but for various reasons, the objective was amended to that of compiling historical documents. The original idea of compiling a national history was abandoned. The work of the Office continues today in its successor, the Historiographical Institute of Tokyo University. Moreover, virtually every prefecture, district, and locality in Japan, even down to the level of individual villages, continues the tradition of official history at the local level today, compiling local historical sources and publishing local histories. Similarly, many individual government bureaus, as well as corporations, universities, and other corporate entities, regularly commission their own histories, extending the model of 'official history' to the private realm.

Korea

Around the fourth century, Korea founded its historiographical tradition, although epoch-making historiography did not appear until the twelfth century. Kim Pu-sik (1075–1151) compiled the *Samguk sagi* (*History of the Three Kingdoms*) in 1145, the oldest extant history of Korea, covering times from antiquity to the decline of unified Silla in 935. It follows the format of Sima Quan's official history, as is shown by the name *sagi* (the Korean pronunciation of *Shiji*). Kim Pu-sik intended to provide moral lessons for posterity. Iryŏn (1206–89), a high-rank Korean Buddhist monk, compiled the *Samguk yusa* (*Memorabilia of the Three Kingdoms*) in 1281, which is the only extant history of Korea before the Chosŏn dynasty (1392–1910), together with the *Samguk sagi*. This work is unique in the sense that he wrote it privately, including myths, tales, and social issues, and even refers to the sources he used.

Sŏ Kŏ-jŏng (1420–88) compiled the *Tongguk t'onggam* (*Comprehensive Mirror of Korean History*) as a Korean official history in 1485, modeled on Sima Guang's *Zizhi tongjian*. It covers the period from ancient times to the end of the Koryŏ dynasty in 1392. This work was compiled under the influence of neo-Confucianism, and reflects the moralistic purpose of praising good and condemning evil. An Chŏng-bok (1712–91) likewise published his *Tongsa kangmok* (*Annotated Account of Korean History*), 20 volumes, in 1778, a chronological treatment of Korean history from Tan'gun, the legendary founder of Korea, to the decline of Koryŏ in 1392 (Baker, 2012).

Vietnam

In Vietnam, just as in Japan and Korea, some official histories were published including *Dai Viet Su Ky Toan Thu* (*Complete Book of the Records of Vietnam*) in 1479, which is based on the style of the *Zizhi tongjian* of Sima Guang (Wade, 2012).

Historiology in East Asia

The study of historical theory in East Asia began with Liu Zhiji's *Shitong* (*Comprehensive Historiography*), written in China in the eighth century (708). It was the first thorough treatise in Chinese – or for that matter in any language – on historical criticism. It was also a history of Chinese historians and a theory of historiography, and deals with such questions as selection and criticism of historical materials, historical objectivity, judgment in history, and historical causality. The work remained a constant reference for Chinese historians until the nineteenth century, and gave rise to the metahistorical tradition in Chinese historiography.

Liu's theory of history was further developed by Zheng Qiao (1104–1162) in his *Tongzhi* (*Comprehensive Monographs*, 200 volumes). In the introduction to the *Tongzhi*, he proposed his core idea of 'synthesis' and 'interrelatedness and causality'. By use of these concepts, he argued for the importance of the continuity of historical development. The voluminous *Tongzhi* also includes '20 Summaries', noteworthy encyclopedic chapters.

Zhang Xuecheng (1738–1801) wrote his *Wenshi tongyi* (*General Survey of Literature and History*), a work on the theory and history of historiography (only published in 1920). The first chapter starts with 'The Six Classics are all history'. Here he expressed his philosophy of history: that the very idea of the 'Way' or the 'Sacred' (*tao*) can only be known through men's actions (*shi*), which are recorded in the *Six Classics* (Nivison, 1966).

In comparison to the voluminous amounts of historical works written in China, very few works of historical criticism were produced. This is quite thought provoking, for it signifies that traditional East Asian historiography was normative in nature. Little discussion regarding the nature of history was needed. Moreover, relatively few works of metaphysical interpretation of the course of history were penned, the exception being Wang Fuzhi's (1619–92) posthumously

published discussion of historical logic and historical tendencies. East Asians valued detailed precision in history, rather than the sort of philosophical interpretations developed in Europe. Some exceptions, informed by Buddhism, were found in medieval Japan. Jien (1155–1225), a prominent Japanese Buddhist cleric, wrote his self-deprecatingly titled *Gukanshô* (*Notes of the Views of a Fool*, 1220), in which he proposed his philosophy of history with the term *dôri*, an idea of historical inevitability. Through this he explained historical processes in terms of the state of development and proposed his own periodization. Similarly, a century later, Kitabatake Chikafusa proposed in his *Jinnô Shôtôki* (*Chronicle of the True Descent of the Divine Sovereigns*, 1339) that Japan is a land founded by the gods and maintained by the blessings of an unbroken lineage of divinely descended emperors (Brownlee, 1991).

The Rise of Modern Historiography in East Asia

Western concepts of 'civilization and enlightenment' were introduced systematically to East Asia beginning in the mid-nineteenth century. They had a transformative effect on notions of history and historiography as well. The movement toward 'modern' and 'scientific' history in East Asia began with a variety of intellectual experiments among Japanese scholars in the 1870s and the 1880s. As Korean and Chinese intellectuals ventured to Japan toward the end of the nineteenth century, 'modern' Western notions and methods of historical inquiry and explanation gradually filtered across the entire East Asian region.

Western historiography was introduced through translations of European and American works into Japanese. Japanese intellectuals created their own neologisms to translate Western terms by combining two or three Chinese characters. Newly invented terms written with Chinese characters were later exported to China and Korea. In consequence, East Asian scholars now share most academic terms in the liberal arts and sciences.

The fact that such translations were feasible and successfully received, demonstrates the stage that Japanese historiography had achieved. By introducing Western historiography through translation, rather than keeping it as the preserve of a few language specialists, Western history and historiography were transformed into common intellectual property for all East Asian historians. This was now made accessible to others who worked on their own national histories.

The successful importation of Western historiography relied on the strength of extant traditional Japanese forms of historiography and auxiliary sciences. Native pioneers in the introduction of Western historiography, historians like Shigeno Yasutsugu (1827–1910) and Kume Kunitake (1839–1931), were initially trained in *Kôshôgaku* tradition (Chinese, *kaozhengxue*: textual criticism originating from the so-called Han School in the Qing period). They were thus well prepared to accept the empirical methods of Leopold von Ranke (1795–1886) and were particularly receptive to his notions of a rigorously critical approach to sources and the avoidance of value judgments. Ranke's ideas had been imported to Japan, when his student Ludwig Riess (1861–1928), who was invited to Tokyo Imperial University as a professor of history in 1887.

The acquisition and acceptance of European historical theory began with translations of leading contemporary European works on historical method and theory, such as those by J.G. Droysen, E. Bernheim and C.V. Langlois, and C. Seignobos. Under the strong influence of Bernheim, Tsuboi Kumezo (1859–1936) published his *Shigaku kenkyûhô* (*Methods of Historical Research*, 1903) in Japan, and Liang Qichao (1873–1929) published the *Zhongguo lishi yanjiufa* (*Methods of Chinese Historical Research*, 1922) in China. Until then to study history in traditional East Asia had meant becoming conversant with the official Chinese histories. The introduction of Western ideas of historiography opened new horizons for students of history. Historians now began to inquire into the 'historical facts'. They went beyond the historical narrative to examine the underlying facts themselves.

A typical example of this new consciousness is found in Shigeno Yasutsugu, nicknamed 'Doctor Obliteration'. Applying the European historical method to Japanese history, he reexamined the *Taiheiki* (*Chronicle of the Great Peace*, 1370–71), and proved that the fourteenth-century military commander Kojima Takanori never existed (Sato, 2008).

A similar consciousness was found in China in the case of Gu Jiegang (1893–1980), whose *Gushibian* (*Critiques of Ancient History*, 7 volumes, 1926–41) contributed greatly to the modernization of Chinese historiography. Gu took a finely honed critical scalpel to the world of ancient Chinese legend, which had long been accepted as fact. His school was nicknamed 'ancient doubters'. His method was rooted in the Qing dynasty (1644–1911) school of ancient doubters; however, it was at the same time backed by the new European historical method (Ku, 1931).

Similarly, in Korea, Yi Pyŏng-do (1896–1989) had been trained in modern historical methods. He stressed the necessity of critical and objective methods of treating historical sources in his *Han'guksa taegwan* (*Grand Survey of Korean History*, 1963).

With the introduction of Western culture to Japan, history became reinstitutionalized, beginning with the governmental section and the newly established Imperial University. However, it should not be forgotten that the introduction of Western historiography reduced East Asian historiography from its former position as a state enterprise to the status of a single academic field. Individual historians started to have their own 'specialty' in order to survive in the new university setting. In order to distinguish themselves from eminent amateur historians, their research was published as monographs in newly established historical journals.

In the West, the 'professionalization' of historical research resulting in the establishment of history as an independent university academic field was a great achievement for a discipline that had been neglected institutionally. By contrast, in East Asia, the introduction of modern Western historical research heralded the end of the prestigious tradition of a form of historiography that had aimed at a comprehensive description of the entire world. Since then, the subsequent evolution of East Asian historiography has developed largely along the lines of 'modern' historiography that prevail in other areas of the developed world.

Development of Modern Historiography

Since modern historiography was introduced to East Asia, its development varied according to the situation in each country.

In China, newly discovered archaeological results urged a new perspective of ancient history on Chinese historians. In particular, the discovery of oracle bone inscriptions laid the foundations for the new Chinese ancient history led by such historians as Luo Zhenyu (1866–1940) and Wang Guowei (1877–1927). These new works were later synthesized with Marxist materialism by Guo Moruo (1892–1978). His *Zhongguo gudai shehui yanjiu* (*Study of Ancient Chinese Society*, 1930) is the first Marxist work on ancient Chinese society. Thereafter, especially with the establishment of the People's Republic of China in 1949, Marxism became dominant among Chinese historians. Traditional historiographical achievements were mostly replaced by reverse interpretations, a trend that was highlighted in the period of the Cultural Revolution (1966–76). After the 1990s, the worldwide information revolution and the introduction of the latest historical methods of social history began to change Chinese historiography, opening it to the rest of the world (Ng and Wang, 2005).

In Japan, soon after the introduction of modern European historiography, the emperor-centered state promulgated a new political orthodoxy, and began to restrict intellectual freedom, especially in the study of ancient Japanese history. Since the 1930s, social and economic history began to apply the Marxist framework to Japanese history, mostly to the study of Japanese capitalism. After World War II, Marxism emerged as the dominant historiographical method, and it was only in the 1970s that Japanese historians began to accept the idea of social history imported from France, Germany, and England. Since the late 1980s, many Marxist historians quietly shifted from socioeconomic history to social history.

Metamorphoses of Public History

Currently, in East Asia, the aura of official history still colors a collective historiographical consciousness. The past is still seen as the most trustworthy 'mirror on mankind'. What is sought from official historiography is not 'a' history, but 'the' history, the reliability of which, people tend to believe, is guaranteed by public editorship.

In China, 24 official dynastic histories have been published and the tradition of public history continues to the present day. The *Qingshigao* (*Draft of the History of the Qing Dynasty*) was completed in 1927, and was finally published in Beijing in 1977. This applies to local history too; the publication of prefectural histories sponsored by local governments began in the Ming dynasty (1368–1644), and continues even in contemporary China.

In Japan, this idea is seen in school history textbooks and local histories. The Japanese Ministry of Education censors all school textbooks, thereby restoring the notion of 'official history' in the realm of history textbooks. Japanese schools teach students 'what' rather than 'why' and fill students' heads with information regarding a fixed course of Japanese history or world history without suggesting that different viewpoints exists. Out of 47 Japanese prefectures 43 have compiled their own prefectural histories and some have been compiled two or three over the past 120 years. Today, one finds hardly a city, town, or village anywhere in Japan that has not done likewise. These local histories are premised on the traditional historiographical notion that there is a historical truth that is embodied in authoritative narratives.

The tradition of official history is also alive in present-day South Korea. The 25-volume *History of the Republic of Korea*, whose publication was completed in 1979 by the National History Compilation Committee (established in 1948), is a state-produced history of the homeland.

Since the late nineteenth century, the practice of history has undergone professionalization and specialization on a worldwide scale, and East Asia too has been drawn into this whirlpool. Since then the style of historiographical practice in East Asia has, in most respects, resembled that of Western countries. Historians, as individuals, are expected to author numerous research papers and books. However, many historians are also involved in publicly sponsored historiography. Countless university-based Japanese historians, for example, serve on the editorial boards of local and prefectural history projects. We can thus observe the continuing coexistence of the two differing traditions of historical study. To put it differently, East Asian historians simultaneously inhabit two worlds of historiography: one a world of Rankean (or traditional East Asian) factual objectivity and another of post-Rankean interpretations of varied and opposing voices (Sato, 2007).

Historical Thought and Historiography: Indigenous Cultures in the Americas

Berthold Riese, Sun Yatsen University, Canton, People's Republic of China

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Historiography and historical thinking among indigenous people of the Americas have been mostly expressed in objects of art (sculpture, murals, and pictorial manuscripts) and in oral traditions. A concept of unified history – beginning with the origin of the world and eras of deities, continuing without break to the creation of humans and human history, and concluding with the ethnocentric tribal history continuously updated to the present – characterizes all groups. Inherent problems of interpretation of sources are the foreign languages and distortions that indigenous traditions have suffered in colonial times under massive European influence by conquerors, missionaries, and administrators. The best coverage of indigenous history and historical thinking is available for the Aztec (Mexico), Mixtec (southwestern Mexico), Highland Maya (Mexico and Guatemala), Lowland Maya (Mexico), Chimu (north coast of Peru) and Inka (highlands of Peru), and, to a lesser degree, North American Creek (Southeastern United States) and Plains Indians (midwestern Canada and United States).

Concepts of History and Their Formation

History is here conceived as information transferred by organized human groups and handed down from generation to generation. Since information can be contained in natural objects as well as in artifacts, a basic distinction needs to be drawn between historical information gained from either of these sources. The way people develop consciousness of their history is by taking information from these sources; storing it in their memory or otherwise; conceptualizing it by means of selection, rearrangement, and interpretation (cf. Markowitsch, 2002); and agreeing collectively on its meaning and its canonical forms. Since the trajectory from information gathering to its societal formation and use is a cultural process, each society develops and cultivates particular ways to do so. All cultures, however, make use of similar media for preservation and proliferation of history, especially oral performances (stories and myths) and figural visualization (monuments and artifacts). In addition to this, more advanced civilizations often use writing as the preferred means for disseminating and handing down historical concepts to future generations.

Mesoamerica

The Mesoamerican culture area existed from *c.* 2000 BC until the Spanish conquest in 1521. It was the home of important civilizations, among whom the Olmec, Epi-Olmec, Zapotec, Mixtec, Toltec, Maya (Highland and Lowland), and Aztec are particularly noteworthy. The only people in Mesoamerica (and in all of precolonial America) to have developed a fully functioning logo-syllabic writing system were the Epi-Olmec and the Lowland Maya (*c.* AD 100–1540). Rather incomplete writing systems (partial writing) were characteristic of their northern and western neighbors – that is, the Zapotec, the Mixtec, and the Aztec. Taken together, these cultures form the core of the cultural area Mesoamerica, which is characterized by similar, and in many respects uniform, conceptions of history. For the purposes of this article, they can therefore be treated as a unit.

Components of Mesoamerican Historiography

Persons (human and imagined), places, and actions are the major elements of Indian historiography in Mesoamerica. Additionally, natural phenomena (animals, plants, geomorphology, weather and astronomical phenomena, etc.) are noted. Judgments, expression of emotions, plans concerning the future, and afterthoughts, as reflections on history, are not expressed. The Mesoamerican *Weltbild* operates with three basic components. Cycles of time express repetitions that are believed to operate in history. Connections and explanations of meaning beyond the plainly visible historical facts are achieved by way of analogy (i.e., interpreting something that is identical or similar in form to be also identical in substance or related in a causal way) and by way of the causal-principle "post hoc ergo propter hoc." Another method is the reification of originally mental constructs and their material (written) expression. This is particularly significant when information is handed down over a long time, since history is largely conceived as the history of living entities and actions.

Analogy, reification, and cyclic rearrangements are the means by which complex historical constructs are created. Theogonical myths of creation and of successive world ages are, chronologically speaking, the first topic. Deities are the protagonists of these remote ages; tribes and their leaders, places of origin, and stations of tribal migrations enter the scene only later during semihistorical and fully historical times.

Reflections on history are not expressed explicitly, but can be deduced in part from historical writing: the human fate is overwhelmingly a world of suffering and danger, predetermined by deities and only to a very small degree influenced by individual behavior. Ancient cultures are studied by their successors not only by way of oral tradition and picture writing but also through artifactual, architectural, and artistic remains. These ancient cultures are conceived as more or less mythical according to their historical remoteness, and are often glorified; for example, the Toltec are considered the inventors of crafts and arts in the eyes of the Aztec and, to a lesser degree, the late postclassic Highland Maya (Kiche and Cakchiquel),

 http://dx.doi.org/10.1016/B978-0-08-097086-8.62030-5

whereas the even remoter culture of Teotihuacan is believed to have been populated by giants and deities.

Historical Chronology

Mesoamerican cultures have developed methods of chronological dating (Riese, 1997). A cyclical and public calendar based on the solar year of 365 days provides the public year count and structures public events. In addition, a ritual 260-day almanac for private and personal soothsaying, which is likewise cyclical, is a second important chronological frame. Both combined and/or extended lead to supplementary large-scale dating devices, such as the Year Bundle (Azt. *xiuhmolpilli*) or Calendar Round and the Long Count. The basic chronological entity of all these variant calendars is the day. The Lowland Maya included in their historical writing the calculation of temporary celestial phenomena, especially lunar, Venus, and Mars cycles, and observed the seeming positions of planets in constellations of fixed stars, comparable to the Zodiac of Ancient Mediterranean and recent European cultures. These celestial phenomena are related to human affairs, and thus especially the sun and the planet Venus are considered factors in their history and forces that exert their influence in the near future (warfare).

By means of such chronological techniques, Mesoamerican people created histories of anthropomorphic and theriomorphic deities and conceived overarching world eras, manifest in the Aztec 'Legend of the Suns' (Riese, 2007) and the famous 'Calendar' or 'Sun Stone' in the Mexican National Museum. These demonstrate that they believed in the existence of five successive eras ('suns'), each with a different duration of a few hundred to several thousand years. Each era was quite distinct with regard to the creatures inhabiting it and their food, and each was finally destroyed in cataclysms by wild animals (jaguars), air (wind), fire, and water (rain). The reader may note the analogy to ancient Greek and Chinese theories of the elements. A new creation marked the beginning of each world age. Even the contemporary world age of the Aztecs around AD 1500 was considered to be of limited duration. It would be destroyed by earthquakes. Within this framework, humans appeared relatively late, at the beginning of the fifth era only. The Lowland Maya had a different and noncatastrophic notion of world eras with apparently smooth transition periods managed by councils of deities presided by God L. Occasionally, they connected themselves as human beings in a speculative way with the world of their deities anteceding the current human epoch. This holds especially true for the ruling dynasty of Palenque, which considered itself to be descended from the gods of the preceding world age. Every Mayan world age lasted exactly 1 872 000 days, which is approximately 5000 Gregorian years.

Factual Content

Origins of Humans

Mesoamerican tribes believed that most political groups of later times originated from a distinct place, which could be the tree of Apoala among the Mixtec, or the Seven Caves (Azt. *Chicomoztoc*), the island of Aztlan in the center of a lake, or a mythical city of Great Culhuacan (Azt. *Huei Culhuacan*) for the central Mexicans. These origins are often relatively recent. According to the Aztec main tradition, they emerged together with six or seven other tribes in AD 1064 from the Seven Caves. In some areas, the origin is placed in a more historical setting, such as the city of Tollan. This tradition was especially popular in Highland Guatemala among the Kiche and Cakchiquel. Tollan was the capital of the famous Toltec, who were actually a historical people admired for their skills, accomplishments, and political power and flourishing about AD 1000. Tollan is today a ruined city in the modern state of Hidalgo, Mexico. Migration myths, apart from being descriptions of historical events, which are to a certain extent factual – as far as can be concluded from language, history, and geography – seem to have functioned as a means of ex-post-facto political legitimization. A successfully migrating and thus surviving tribe legitimizes its right to rule over the traversed territories and the cities within, or at least to exert indirect political control in cases where the areas in question are too distant for factual dominance.

Polities and Tutelary Deities

The interrelation of the people with their pantheon becomes apparent in the system of tutelary deities of tribal groups and city-states: Quetzalcoatl for the Toltec (capital: Tollan) around AD 900–1100 and later also for the Chololtec (capital: Cholullan in the modern state of Puebla, Mexico) around AD 1000–1500, Tohil for the Kiche (capital: Utatlán) around AD 1000–1500, Huitzilopochtli for the Aztecs (capital: Tenochtitlan or Mexihco) around AD 1350–1500, and Camaxtli for the Tlaxcaltec (capital: Tlaxcallan in the modern state of Tlaxcala, Mexico) of the same period. In this manner, origin-related, transhistorical interrelations between humans and deities take form and are kept alive in a similar way as they are known for Old World civilizations (Sumer, Ancient Egypt, Babylon, and Jewish culture of the Old Testament) with deities intervening actively in the fate of their tribe. Tribes with their leaders, ruling dynasties arising from them during the process of becoming sedentary (Breuer, 1990), and their tutelary deities are the main actors in Mesoamerican history. Rulers are described with their most important *rites de passage* (birth, inauguration, marriage, procreation of offspring, and death), their martial triumphs, and – to a lesser extent – their civilizing deeds (introduction of cultivated plants or technical skills, monument erection, temple building, and water management), but not with any personal characteristics.

Geographical Horizon

After settling down, topics such as wars, marriage alliances, conspiracies, insidious martial acts, and self-sacrifice appear as historical episodes in tribal history, and the delimination of national territory is documented in special maps or cadastral collections. It is in these later times that major wars between Mesoamerican polities become a subject of history. In central Mexico, a confederacy of three Mexican cities – Tenochtitlan, Tlacopan, and Tetzcuhco – threw off the yoke of Tepanec rule of Azcapotzalco and gained complete independence, prestige, and property of lands (Riese, 2011). Later Aztec historians were well aware of the political and social importance of this war of liberation.

The Mayan area was never a unified political entity. It stayed separated into three regions, with little interaction and

territorially small city-states. In the southern Maya Lowlands, the city-states of Calakmul and Tikal fought a hegemonial war for the central Petén region for some 200 years (Martin and Grube, 2000) and during this time formed changing alliances with second-level cities. In northern Yucatan, repeated foreign intrusions by Mixtec and Toltec conquerors and later small-scale internal wars among a dozen petty states were decisive in the cultural memory, giving it a distinct fatalistic touch (Morley & Barrera Vásquez, 1949). The Guatemalan Highlands were the scene of frequent warfare between Mam, Kiche, and Cakchiquel (Carmack, 1973), events that are amply documented in their chronicles (Brinton, 1885; Schultze Jena, 1944; Recinos, 1957) and dramas (Rabinal, 1994).

Since the range of historical accounts rarely transgresses the polity and its immediate neighbors and never exceeds the limits of the Mesoamerican core area, 'world history' from a precolonial Indian perspective is very limited. History is primarily tribal or city-state history; regional history occasionally appears during selected short periods of single-power dominance and in a weaker form through ceremonial relations, especially the consecration of rulers in the holy city of Cholollan, and pilgrimage to important shrines (e.g., the Sacred Cenote in Chichén Itzá). History was never world history, not even pan-American history, neither in abstract thinking nor in political action. This compares, albeit on a narrower basis, with ancient and medieval concepts of the world in Middle Eastern and European cultures. No statements revealing knowledge or speculation about countries and peoples beyond this horizon can be found, even though archaeological investigations indicate external contacts in the form of trade relations with peoples far outside Mesoamerica, namely, with the North American Southwest, the Northeastern Woodlands (Mississippian cultures), Panama, and Ecuador (Riese, 2010). This seemingly odd and willful limitation of the historical horizon is characteristic of many early states and of most chiefdoms worldwide.

Social History

It is men who dominate the historical records as well as the actual political scene, and these are in general members of the nobility, since all Mesoamerican societies were ranked. The historical records, starting in about AD 300, give special emphasis to particularly successful individuals, such as the Toltec rulers Quetzalcoatl and Huemac, '8 Deer Tiger Claw' among the Mixtec, and the rulers 'Pakal' of Palenque, 'Rising Sun' of Copán, and 'Kakupakal' of Chichén Itzá among the Classic Lowland Maya. Many more are known from postclassic times, especially in central Mexico as witnessed in the Annals of Quauhtitlan (Lehmann, 1974), Highland Guatemala, and northern Yucatán.

In addition to politically active members of the ruling nobility, historical records of the Maya and the Aztec convey a few names of artists (painters, sculptors, poets, and performing artists), thus demonstrating to some extent interest in cultural and art history on a personal basis beyond the dynastic record.

Taking into account that history is predominantly the subject of males, the reader's attention must be drawn to the occasional significance of women among Mesoamerican people, especially in the Mayan city-states of Palenque and Yaxchilán around AD 600–700 and in early Aztec history beginning in 1400 with 'Ilancueitl,' mother of the first official Aztec ruler, Acamapichtli, and with several other prominent women. These women presumably never equaled men in rank, but gained prominence in their patrilineal societies as substitutes for a male heir, or as royal consorts upholding dynastic continuity. It remains unclear whether this role involved real implementation of power or whether it was confined to representational duties, although – in keeping with ethnological theory of gender studies – a rather representative and symbolic function is suggested. Women are also conceptualized as instruments of political provocation, especially when abducted as prisoners of war, raped or forced into marriage, and sometimes even put to sacrificial death. Respectful treatment of women is rarely reported, albeit in Aztec and Mixtec historiography a few cases are described.

Reflections on History

It is impossible to give a definite description of historical thinking among Mesoamerican Indians, since no explicit statements related to this can be found in the sources, and indirect allusions are vague. It is, however, manifest that humans are controlled and directed by deities to whom they are compelled to pay tribute in the form of prayers, offerings, and cult practice (there are 18 major feasts per year) in order to maintain and ensure their and the world's existence and well-being. This is most evident in the Aztec's dogmatic obligation of invigorating the sun on its daily course over the firmament with sacrificed human hearts. This compulsion to human sacrifice led to sacrificial excesses later witnessed by the Spanish conquerors. Prior to the conquest, several Indian philosophers had already criticized the practice of human sacrifice as incorrect by expressing their desire for the idealized Toltec times (around AD 1000) to return, when people sacrificed flowers and animals instead of human beings. Human sacrifice included self-sacrifice, especially drawing blood from various body parts (tongue, penis, and thigh).

The general Mesoamerican outlook on human life is pessimistic and fatalistic. This manifests itself especially in the divinatory rituals of the Maya, Zapotec, and Aztec, where indifferent or positive prophecies are outnumbered by negative ones. The collective fatalistic behavior of the colonial Yucatec Maya and – two centuries later – of the Itzá, a late enclave in colonial New Spain that succumbed only in 1697 to Spanish dominance, concerning their own political fate might be an extreme example of this attitude toward the future, gained from analysis of the past. However, it should be taken into account that the Yucatec case could well be the result of traumatic experiences during the Spanish conquest, since only colonial sources give information on this topic. Thus, it is difficult to evaluate how strong fatalism was traditionally. The same holds good for the often-cited pessimistic and seemingly inactive attitude of the Aztec ruler Moteuczuma confronting the Spanish incursion into his territory in 1519.

Human life is considered to be hard and fateful (like in old Jewish faith). Consolatory compensation is offered by the Aztec concept of the otherworld, where sweet paradise awaits those who endure dangerous labor and hardship on earth, favoring warriors dying in battle (cp. Islamic belief) and

childbearing women. Yet we lack a theologically differentiated comprehension of the Aztec idea of an afterlife, since this is not further described in the historical accounts (Eschmann, 1976). The Lowland Maya left more written and pictorial documents regarding this topic, especially in their rich funeral ceramic paintings (Riese, 2004).

Reflections on antecedent cultures and polities can rarely be found among the descriptive historical traditions of the central Mexican Aztecs, other than general admiration for cultural accomplishments of the Toltec. The major city-ruin of Teotihuacan, which had been destroyed and abandoned 700 years prior to the arrival of the Aztecs in the valley of Mexico, is taken by myth as the place of origin of the gods. Even earlier cultures are remembered indirectly by conserving their artifacts and imitating their products, as has been amply shown in the excavations of the Major Aztec Temple of Tenochtitlan (nowadays the 'Centro Histórico' of Mexico City).

Sources

Numerous monuments executed in lasting materials (stone) are an important source for the study of historical thinking of Mesoamerican people. They date back as far as 1000 BC, beginning with sculptures portraying Olmec rulers, and stone slabs illustrating Zapotec conquests (so-called *danzantes*). The first real inscriptions date from the first two centuries AD, called the Epi-Olmec period. Especially noteworthy is the stela from La Mojarra, although its long inscription presumably representing the Proto-Zoquean language of the Isthmus region has not yet been deciphered, contrary to much publicized claims. It is presumably historiographic in content and presents a royal portrait with a long dated text. Similarly, the Zapotec produced narrative sculptures, albeit with rather short accompanying texts (Marcus, 1992).

Murals from Teotihuacan (Miller, 1973) and ceramic paintings of the Classic Lowland Maya (Kerr, 1989–2000, and Internet database) with their pictorial and partially narrative depictions and hieroglyphic explanations are major sources for reconstructing the Mesoamerican Classic from AD 300–800, since several thousands of them have been secured (mostly illegally by grave robbers) and are accessible to scholarship. These paintings show scenes from royal palaces, royal visits, banquets, payment of tribute, hunting of deer and birds, ball games, market scenes, processions, and postwar ceremonies. Most illustrations on Maya vases probably allude to the otherworld. Since daily life can be assumed to have served as the calcque for the concept of this otherworld, it is possible to reverse this relation and deduce everyday life of the Maya from ceramic paintings. In many instances, concrete persons are named as protagonists of the scenes or recipients of the vessel, and sometimes the artists of the painting are also named.

Further sources of historical records are pictorial and written manuscripts with historical contents, which – due to their fragility – generally do not date back too far. Only about a dozen precolonial manuscripts exist, four from the Maya Lowlands and the rest Mixtec in origin. Perhaps another hundred copies and extracts compiled during early colonial times have also been preserved. Most of those are of central Mexican and Mixtec origin, with very few from the Tarascans and Zapotec regions. Yucatecan (Barrera Vásquez and Rendón, 1948) and Highland Maya (Schultze Jena, 1944; Recinos, 1957) sources written in Indian languages mostly lack pictorial elements.

Christian missionaries introduced writing with the Latin alphabet in early colonial times (AD 1520–1650). Written documents of this type are especially numerous in central Mexico. Basically European in form, and to some extent even in content, the object of these written sources is almost completely related to the colonial situation (lawsuits dealing with inheritances, properties, and privileges, and history of the Spanish conquest). Many colonial writings obviously connect pre-Spanish traditions of partial writing and chronology with oral traditions and form a new integrated genre. In the Guatemalan highlands ('Popol Vuh' and 'Annals of the Cakchiquels,' Brinton, 1885), as well as with the Yucatec Maya ('Books of Chilam Balam,' which means books of a prophet named 'Jaguar'). These sources not only are less numerous than those of European confection but also show less European influence in content. Topicalizing other Mesoamerican regions (Tarascans, Zapotec, and Nicarao), only a few historical documents have been preserved and/or included in Spanish historiographic treatises. They reflect study of now-lost Indian documents and interviews with knowledgeable Indian informants. Thus, Gonzalo Fernández de Oviedo y Valdés (1959) reports on the Nicarao and their tribal history. The Nicarao lived at the southern periphery of Mesoamerica and are name givers to the modern state of Nicaragua. The Franciscan missionary Juan de Torquemada (1975–1983) conveyed comparable traditions of the Pipil living in modern Guatemala and El Salvador. The accounts of the Mixtecs by Francisco de Burgoa (1674) are comprehensive but not very detailed, and the historian Francisco Antonio de Fuentes y Guzmán (1972) includes in his writings summaries of many now-lost Indian documents from Highland Guatemala. A major European element in sources, which have been written in the indigenous languages but with Latin letters, is the effort to produce some sort of synthesis, often named 'world history' and 'natural history.' This effort can be noted, for instance, in a general chronology drawn from uncoordinated lists recording royal successions of individual Indian city-states as presented by the anonymous *Annals of Quauhtitlan* (Lehmann, 1974) and in the writings of Domingo Chimalpahin (1963–1965). As suggested by its subdivision into 12 books, the topics, and the illustrations, the *Historia General* of the Franciscan friar Bernardino de Sahagún (1950–1981) obviously resembles medieval European natural history and its antique origins (Pliny the Elder), in this case containing authentic information of pre-European Aztec culture provided by his Indian informants.

Other Regions of the Americas

On their first contacts with indigenous peoples of the Americas, European conquerors came across various forms of 'picture writing' (thus the then current nonscholarly terminology) that was used to write down historical events. Besides Mesoamerica, treated in the foregoing paragraphs, this was observed in several areas of North America, predominantly in the eastern woodlands (Voegelin, 1954) and on the plains and prairies west of the Mississippi (Mooney, 2011). They were in use much

later than in Latin America, since large parts of North America were conquered and settled by Europeans only during the eighteenth and nineteenth centuries. South America was in this respect quite the reverse, even though pictorial representations in painting (Moche and Nasca), weaving (Paracas and Nasca), rock engraving (Nasca), and string notations (Quechua: *khipu*) were developed early in its cultural history and highly elaborated. No such records have been reported from the vast lowlands of South America (Venezuela, Brazil, eastern Bolivia, etc.).

North America

Conceptually and structurally similar to Mesoamerican historical tradition are the eighteenth- and nineteenth-century historical traditions of the Lenape (Algonkin language family) and of the Indians of the Great Plains in North America (Kiowa, Blackfoot, and Teton), both recorded in non-book-like fashion since books did not exist in Native North America prior to the advent of Europeans. The Lenape (formerly called Delaware) and other related groups of the East (e.g., the Creek) (Gatschet, 1884) cultivated an oral and possibly pictorially written tradition of the tribe's migrations led by certain chiefs, while the Plains Indians, being acephalic societies, depicted outstanding events from the group's daily life following the year's seasons. These are called 'Winter Counts' (Handbook, 2001) and conspicuously stress intertribal warfare, but not, however, the then already more decisive wars against Anglo-American intruders.

The South American Andes

The study of historical concepts in the Central Andes, which were lastly dominated by the Inka, is rendered more difficult due to a lack of precolonial written records. All records of Indian history from this culture area originate in early colonial times, and are based on oral traditions and the system of knotted cords (*khipu*) only. Thus, factual history for the Chimu kingdom on the north coast, and the Inka empire in the highlands around the capital city of Cuzco, does not go back beyond AD 1400, when, retrospectively, mythical legend begins.

Andean history was put into writing almost exclusively by Spaniards (de Betanzos, 1987) or mestizos (Garcilaso de la Vega, 1609) and thus makes use of categories and forms of a European conception of history. This holds true also for writings that are sometimes considered as 'ancient Indian' such as the preciously illustrated '*Nueva Corónica y Buen Gobierno*' of Guaman Poma de Ayala (1936), which is European in its format and illustrations, even though the author is Indian, writes a mixture of Spanish and Quechua, and represents an Indian perspective in his writing. The anonymous historical drama 'Ollantay' is, according to its form and subject, rather more similar to a baroque theater play from Europe than an expression for Indian thinking and acting, albeit written in a stylistically pure form of Quechua, the language of the Inka empire, which makes it appear very Indian in conjunction with its theme, a heartbreaking episode of the late Inka empire (Middendorf, 1890).

The general assertion that something like an 'Andean historical concept' existed and is reflected in the sources, expressed by prestigious scholars, is not a helpful concept, since it remains vague and originates in projections by western scholars and their historical thinking based mainly on sources written by European authors.

Recent Achievements and Problems Ahead

Brain research and historical case studies of the last decades have brought to light the extreme extent of human molding, transforming, and distorting of memorized information. This has led to the consequence of neoskepticism toward so-called historical truth and the equation of historical memories with factual events as conveyed in oral history and written records based on these (Markowitsch, 2002). These new insights should be kept in mind, and all reconstructions of history gained by using humanly produced sources are to be reevaluated.

Without explanations from the creators themselves, it also remains difficult to understand the content, intent, and symbolism of the great range of historical objects and sources, even though researchers have presented seemingly comprehensive and highly sophisticated interpretations, in particular Seler (1960–1967), Eschmann (1976), and Jansen and Pérez Jiménez (2007), to mention only the well-conceived efforts.

The deciphering of the Epi-Olmec script is a pressing research desideratum since it would give us direct access to historical writing antedating hitherto useable records by 200 years. Hieroglyphic captions of Mayan ceramic paintings are well understood but not yet fully recontextualized to their place of origin, due to the fact that most of them originate in clandestine excavations. Most other Mayan inscriptions associated with distinct persons that designate singular objects like 'earring' or '(sack full of) beans' are short; also, they neither contribute to a differentiated understanding of the depicted scene, since they only name the object, nor do they help much in a broader comprehension of local history, even when they mention the owner or receiver of said object. Analogy from early colonial or even ethnographic sources of the present to foster our understanding of ancient Mayan sources is fraught with pitfalls, but nevertheless it is advanced from time to time by scholars who seem to wish to transcend our current knowledge using dubious research methods.

Among non-Mayan and non-Aztec Indian documents, most progress has been made in understanding Mixtec pictorial historiography, thanks to the lifelong research of two scholars, the Mexican Alfonso Caso (1977–1979) and the Dutch Maarten Jansen.

For Andean history, the most valuable recent research has been the use of colonial administrative sources as well as many contributions of field archaeology using 'sophisticated analytical techniques enabling us to gain a more precise environmental and chronological framework for historical projections.

Texts from early colonial times (until about 1650) written in the indigenous languages by means of the Latin alphabet (Crónica mexicayotl, 2004) are easier to approach, although they are still not very well understood either. Most of them originated with the Aztecs, some of them with the Yucatecan and Highland Maya, while there are only very few from other cultures and regions. Whereas the more technical problems of

translation can be met by increasing language competence, the main problem of ethnohistory (the technical term for the discipline of history that analyzes sources in the writing systems and languages of the people studied, Ethnohistory, 1972–1975) is to grasp concepts, metaphors, and so on to understand the *Weltbild* of the Indians, to separate it from European projections and intrusions, and finally to evaluate their emic intent and assess their factual content.

Devoting further efforts to research of chronological problems is most likely rewarding, especially for Mesoamerica. Mayan, Aztec, and Mixtec time counts are not only of high accuracy but also omnipresent in historical records (Prem, 2008a,b), and they are partly interrelated. For the time of the Maya Classic from AD 300 to 900, there is not a single year without several exactly datable historical accounts. Central and western Mexican historiography covers a time span from approximately AD 600 until the Spanish conquest and is structured with about the same amount of dates. However, due to their calendrical system, central Mexican dates are chronologically ambiguous, since they recur every 52 years, while Mayan dates are still floating in (western) time, for lack of a concluding correlation of western (Gregorian or Julian) chronology and the Mayan Long Count. The interrelations of dates in the different historical calendar systems (of Mixtec, Aztec, and Lowland and Highland Maya), the comparison of dates with chronological reconstructions in archaeology, and absolute dating by way of historical astronomy will some future day render it possible to compile a historical chronological chart for the Mesoamerican core area covering the period from AD 100 to 1521.

For North America and the Andean Culture Area, chronology is purely archaeological, and thus less precise and not directly correlated with historical events. But advances in chemical and physical dating techniques of archaeological artifacts will help greatly under these conditions, to gain more precise insights into the chronological development of cultures.

Because of Mesoamerica's high civilizing and political complexity as well as its dynamics, the analysis of overarching political and cultural systems and their changes in time is a very important field of research. Points in time of such systems are distinct and often short periods during the formative Olmec epoch, the middle classic Teotihuacan horizon, the Toltec dominance and expansion during early postclassic times, and the Aztec empire in late postclassic times, respectively. A great amount of effort has already gone into acquiring knowledge on the postclassic times in central Mexico, Oaxaca, northern Yucatan, and the Lowland Maya Classic. Yet the abundant archaeological findings of this period, including monumental sculpture and buildings, can be considered only the backdrop for political and economic history, worldview, and symbolic language.

General anthropological theories have made use of the respective Indian cultures, mostly Aztec and Inka, since Bandelier (1880) classified the Aztecs within the scope of an evolutionary scheme developed by Lewis Henry Morgan. It was followed over 100 years later by Breuer's (1990) more sophisticated analysis and has been amplified toward cultural aspects by art historical and architectural studies (Riese, 2011). American cultures are particularly relevant for this kind of research because it is assumed that they developed independently of Old World civilizations, and thus serve as models for testing general anthropological theories.

In spite of the importance of indigenous American historical documents, artifactual and written, we should be cautious to accept newfound documents and artifacts at first glance as authentic, since forging has been a constant and prolific industry for over 150 years, and too many scholars are prone to accept such forgeries as genuine documents, since they seem to offer useful information and often fit well into the expectations of current research. The most disturbing forgeries in recent decades were a series of written 'histories' on the Yucatan Maya, probably produced in Mexico, and a vast number of 'colonial documents' purportedly containing detailed information of the late Inka culture, produced in southern Italy. A more ancient problem in this respect is, of course, the authenticity of the North American Walam Olum (Voegelin, 1954) attributed to the Lenape Indians.

Historical Thought and Historiography: Islamic Tradition

Richard S Humphreys, University of California at Santa Barbara, Santa Barbara, CA, USA

Abstract

Islamic historiographic tradition developed across Muslim societies between the early eighth century and modern times, with a distinctive body of practices and forms owing little to those used in neighboring or preceding societies. History never became a formal discipline but was composed by self-taught amateurs, chiefly bureaucrats and religious scholars. Historical writing began with the biography of Muhammad and the controversial events of Islam's first decades, but eventually grew to encompass both history since the Creation and the events and notable persons of particular regions. In the twentieth century, Muslim historians have increasingly adopted the historiographic models of post-Enlightenment Europe.

'Islamic historiography' is a useful but somewhat misleading term commonly applied to the historical writing produced in the predominantly Muslim societies of Asia and Africa between the rise of Islam (post-CE 622) and the late nineteenth century. In contrast, history written after that point may have a distinctive regional or cultural orientation, but it increasingly falls within the post–Enlightenment historiographic discourse established and dominated by Western Europe. The term is useful because it allows us to discern the degree to which the enormous historical literature produced under the aegis of Muslim-dominated societies and polities embodies an unbroken (albeit complex and constantly changing) tradition of debate over the meaning and interpretation of the past. It is misleading insofar as it beguiles us into thinking that this literature was produced entirely by Muslims, or that it is exclusively grounded in Islamic doctrine and focused on religious issues. In fact, a number of important works within the 'Islamic' historical tradition (admittedly a small proportion of the total) were produced by non-Muslims (Hoyland, 1997). More importantly, much historical writing by Muslims focuses on decidedly nonsacred topics and presents these topics in a manner that owes little to Islamic religious concepts and concerns.

History as a Form of Knowledge and a Profession

Quite apart from the ambiguity of the term, Islamic historiography represents an intriguing paradox. Historical works were produced in great profusion by all sorts of authors and compilers from at least the mid-eighth century on, and it is evident from the number and distribution of manuscripts that these works reached a wide readership. Widely recognized technical terms for historical writing emerged very early and remained in constant use thereafter: *ta'rikh* (literally, 'dating', hence 'chronicle'), *akhbar* ('recitals of events'), and, less commonly, *sira* ('manner of life', hence 'biography'). One must not think of these terms as referring to sharply defined categories. For example, *ta'rikh* (the most widely used term) applied not only to chronologically organized works but also to historical writing of every kind, including alphabetically arranged biographical dictionaries. *Sira* most often referred to biographies of the Prophet Muhammad, but was sometimes also attached to the lives of sultans and other secular figures (Rosenthal, 1968; *Encyclopaedia of Islam* sub verbo *ta'rikh*; Robinson, 2003).

Historical writing in all genres was produced in great quantities. However, although it permeated medieval Islamic culture and was universally seen as a distinct form of literary practice, it never achieved the status of a 'science' (Arabic, *ilm*) – i.e., it never became a formal subject of study and training in the scholarly curriculum. Within the normative classification of knowledge constructed by medieval Islamic culture, history remained always on the margins of scholarship and literature. For religious specialists, it was ancillary to the core disciplines of legal studies (*fiqh*), prophetic tradition (*hadith*), and Qur'anic exegesis (*tafsir*). It was useful for identifying and evaluating the scholars who had produced and maintained religious knowledge generation after generation, for throwing some light on the circumstances in which revelation had come, for demonstrating how Islam had expanded throughout the world through divine providence, and even for clarifying the origins and meaning of the sectarian conflicts that continued to afflict the community of believers. In contrast, secular historians (who began to emerge on the scene in the tenth century) tended to focus on recent and contemporary events among the political elite. These were often bureaucrats and courtiers, as one might expect. However, many were religious scholars by training and profession, albeit men with close ties (as judges or official preachers) to the regime. They might well regard history as *magister vitae*, a trove of practical wisdom, but only rarely did they see it as the foundation for a systematic investigation of politics and society (Robinson, 2003).

Even in the humble roles of handmaid and schoolmaster, however, historical writing still generated many works of great literary and methodological sophistication. The political (and occasionally social and economic) analyses of the best Muslim historians yield nothing to their counterparts in the ancient, medieval, and Renaissance West. All this suggests that history played a much more fundamental role in defining Islamic self-understanding than that culture's spokesmen were able to articulate. On the broadest level, history – even the history produced by secular writers – showed Muslims how God was working his purposes out in the deeds and sufferings of the community of believers. In particular, it

measured the fidelity (or lack thereof) of the believers to the revelation brought by Muhammad. History challenged Muslims to measure their progress on the path to salvation or perdition as the inevitable Day of Judgment approached (Khalidi, 1994).

Historians were in effect self-taught amateurs, men who made their living as bureaucrats or religious scholars and wrote history in their spare time. They learned how to do it not through formal study with established masters, but simply by studying the works of their predecessors and contemporaries and adapting the forms and approaches of these writings to their own purposes. History, in short, was a literary practice, not a discipline. Some histories were written at the behest of rulers anxious that their deeds be properly memorialized for future generations, but even these do not represent a true professionalization of history. In late medieval and early modern times, we do find quasiofficial court historiographers under the Ottomans, Safavids, and Mughals between the sixteenth and mid-nineteenth centuries, but there was no permanent office devoted to this purpose. For the most part, the job was handed over on an ad hoc basis to any member of the ruler's entourage who was thought to possess sufficient political acumen and literary skill (Quinn, 2000; Robinson, 2003).

Two outstanding scholars did attempt to make history into a generally recognized formal science, but in spite of their great prestige and influence, neither achieved his goal. The Qur'anic exegete, jurist, and historian Abu Ja'far al-Tabari (838–923) tried to demonstrate in his vast *Chronicle of Prophets and Kings* that historical reports could be sifted and presented according to the rigorous criteria applied to *hadith* (the dicta ascribed to the Prophet, which embodied his teaching and example) (*Encyclopaedia of Islam* sub verbo 'Tabari', *ta'rikh*; Robinson, 2003). However, very few followed him down that path, even though his reconstruction both of pre-Islamic history and of Islam's first two centuries provided an authoritative framework for almost all later chroniclers. His method simply was not workable for contemporary events from the ninth century on. As for early Islamic history, most of Tabari's successors were content simply to condense and paraphrase his work (however, there was a significant, and perhaps unsurprising, revival of interest in the early sources for the Arab-Muslim conquests, *c*.630–651, among both Andalusian scholars contending with the Reconquista and Syro-Egyptian historians in the era of the Crusades). Five centuries later, the North African Ibn Khaldun (1332–1406) – a gifted legal scholar and logician as well as a historian – argued in his famous *Muqaddimah* that history was the science of society, and as such ought to be treated as a branch of formal philosophy. Again, his argument did not suffice to move historiography up to that exalted status, in spite of the substantial circulation that his work enjoyed (Mahdi, 1957; *Encyclopaedia of Islam* sub verbo Ibn Khaldun; Al-Azmeh, 1990). On the other hand, he was not without influence. The historians of fifteenth-century Egypt (some of them his direct students) paid far closer attention to social and economic life than had earlier historians. Likewise, certain officials in the seventeenth- and eighteenth-century Ottoman Empire were quite interested in his theories on the causes for the rise and fall of dynasties.

The Producers of Historical Knowledge

As we have seen above, history was written (and read) by highly literate men with some time on their hands. Given the social and educational structures of medieval Muslim societies, that means that it was written chiefly by chancery secretaries (Arabic, *kuttab*; singular, *katib*) and religious scholars (Arabic, *ulama*; singular, *alim*). It is tempting to describe these two groups in terms of well-defined ideal types, and thus to posit opposing historical perspectives of palace and mosque. In reality, these perspectives overlapped in complex and constantly changing ways (Rosenthal, 1968; Fleischer, 1986; Humphreys, 1991; Quinn, 2000; Robinson, 2003).

Throughout Islamic times, the *ulama* were given state appointments as judges or mosque officials, although it is true that a great many of the most prestigious scholars prized their independence and refused to accept such positions. But after the mid-eleventh century, even the independent-minded scholars found it difficult to refuse professorships in the burgeoning religious colleges (madrasahs) that were endowed and to some degree controlled by the rulers and their senior military commanders. However scrupulous they might be, scholars could hardly avoid some entanglement with the princely courts. Quite apart from questions of material interest, most also had a profound fear of social disorder – as a popular dictum had it, one night of anarchy was worse than 60 years of tyranny. Thus, they seldom challenged or even questioned the underlying political order of their societies, however severely they might criticize particular rulers.

On the other hand, their relations with the princes were always ambivalent. They knew that rulers came and went like the clouds. They might collaborate with the regime in power but rarely identified themselves closely with it. Their job was to embody Islamic beliefs and values in their own lives and to propagate these within society at large. Religious scholars came from a wide range of social backgrounds and interacted constantly with the urban population. They indeed derived much of their prestige (the only solid basis of their social influence) from their accessibility to all.

As historians, then, the religious scholars were the spokesmen for the community and its concerns. As such, they stood not so much against the princely courts as apart from them. They naturally placed the rulers and their doings at center stage in their historical writing, since the rulers were the heads of the Muslim community within the territories they ruled – responsible not only for defense, public order, and justice but also for ensuring that Islamic religious practices, moral norms, and legal procedures were maintained. Without a Muslim ruler, however incompetent or corrupt, an authentic Islamic way of life was impossible. However, rulers were not the sole guardians of these things; scholar–historians were acutely aware of the indispensable role of their own class. They asserted this role in every word and gesture, and by recording their own deeds in countless biographical dictionaries of eminent religious scholars.

In contrast to the religious scholars, chancery secretaries were men of the regime, who shared and indeed articulated its perspectives on rulership and society. The middle and upper ranks especially tended to live in a world apart from the people they governed. Their lives and fortunes were held at the whim

of an autocrat, whose purposes and moods were of far greater importance to them than the problems of the larger society outside the palace walls. In spite of their narrow focus, the secretaries often took a surprisingly critical view of the regimes they served. Usually, they judged them in accordance with the political traditions of pre-Islamic Iran, although these were often blended with specifically Islamic values derived from the Qur'an and teachings ascribed to the Prophet (*hadith*). These traditions centered on the unique role of the ruler in upholding justice within his realms. In practice, that meant respect for established social hierarchies, equitable taxation, enforcing right religion, and control of the army. The chancery secretaries might well be sincere Muslims, but for them, the ruler and his senior officials were the sole actors who really counted. Hence, their historiography is strongly focused on the court and on the struggle for power. The best historians provide searching analyses of this struggle, to be sure, but with a few notable exceptions, they portray it as the affair of a few score individuals, not of broad social groups and forces.

The Problem of Origins, CE 622–825

Islamic historiography was born in obscurity. The earliest historical texts that we now have only acquired something close to their present form in the late eighth century. For earlier stages of development, we are reduced to inference or, more accurately, speculation. We can at least be sure that Islamic historical writing emerged within Arabophone Muslim circles, for the most primitive elements in this literature are couched in archaic Arabic and reflect almost exclusively the internal concerns of the Muslim community. Islamic historiography emerged out of the triumph and trauma of the seventh century: The sudden rise of a new religion among the peoples of Arabia, the vast conquests that they made under the banner of that religion, the profound transformation that religion and empire wreaked on their traditional culture and sociopolitical organization, and the bitter civil strife that rent a unified community of believers into hostile sects and factions. To make sense of these tremendous events, early Muslims had to devise some way of recalling, ordering, and interpreting them (Khalidi, 1994; Donner, 1998; Robinson, 2003).

By the early eighth century, they discovered an overarching pattern of meaning and value in the Qur'an. The Qur'an (the collection of the revelations received by Muhammad between his call to prophethood *c*.610 and his death in 632) is far from a historical record of the earliest Muslim community. It provides no narratives of Muhammad's life and struggles; it only alludes to a few of the events that formed that community. Rather, it places Islam within the long sequence of prophetic messages through which God has repeatedly called his creatures back to obedience. In the Qur'an, Muslims could see how a prophet had been sent to every person, bearing the promise of salvation for those who believed and the threat of damnation for those who refused. Most people did reject their prophets and suffered destruction. In contrast, a very few (most notably the Jews and Christians) accepted their prophets and prospered so long as they adhered to the messages these prophets had brought them. Over time, however, even these believing people tended to fall away, and God called them to repentance by periodic chastisement and humiliation. The Qur'an thus laid down for Muslims a paradigm that explained the course of historical events. This paradigm contained three elements: the covenant offered by God to his people, the ever-present threat that this covenant might be betrayed by its recipients, and the desperate hope for redemption even after betrayal. In the circumstances of the seventh and eighth centuries, the Qur'anic paradigm of Covenant–Betrayal–Redemption was very compelling indeed (Humphreys, 1991; Donner, 1998).

Paradigms do not create literary genres. To recount the things that had befallen them, the early Muslims developed short prose narratives (Arabic, *akhbar*; singular, *khabar*) focused on discrete events. The earliest historical narratives about the seventh-century conquests and the internal struggles within the community of believers sprang up in a spontaneous, uncontrolled manner. They represented the contradictory memories and claims of innumerable tribal spokesmen and sectarian advocates, not a master narrative propounded and controlled by official spokesmen of the caliphal court. They were originally (and perhaps remained for some decades) oral accounts, and changed constantly as they were told and retold. Moreover, highly partisan narratives inevitably provoked counter-narratives. With a very few exceptions, it is no longer possible to recover the primitive form of any of these early narratives. That was no doubt the case even for the scholars of the mid-700s (Wellhausen, 1899; Noth, 1994; Donner, 1998; Robinson, 2003).

The earliest methodical effort to identify, collect, and reduce to writing the most reliable (i.e., religiously and politically acceptable) of these floating, infinitely plastic narratives took place around 700 under the aegis of the Umayyad caliphs. It is important to note that these first written versions were not books meant for public circulation, but rather notes and drafts for personal use. The information in them was for the most part transmitted orally, not via written copies. Only by the 730s can we think of more or less organized collections of such narratives (Schoeler and Toorawa, 2009). In any case, the Umayyads could impose no monopoly on the process of collection and redaction; indeed, their version of Islam's first century was nearly obliterated when they were overthrown by the Abbasids in 749–50 and subjected to a systematic *damnatio memoriae*. Only between 750 and 830 did a group of scholars, some with ties to the Abbasid court and some quite independent of it, began to generate a stable corpus of historical narratives. This corpus represents what we now regard as the 'mainstream' version of early Islamic history. The Abbasid court used its patronage to encourage the articulation of an overarching narrative that would support its claims to political and religious authority. Its capacity to control this process was very limited, however, and numerous competing versions produced by rivals and opponents of the Abbasids survive, albeit in fragmentary or masked form. However obscure the 'realities' of early Islamic history may be, the historical debate of the late eighth and early ninth centuries is quite visible (Lassner, 1986; Robinson, 2003; Borrut, 2010).

The narratives collected, redacted, or (sometimes) created in the early Abbasid period were usually gathered in 'monographs' devoted to a single event (typically a battle) or category of information (e.g., lists of provincial governors). However, this period also witnessed the first major syntheses. Ibn Ishaq

(d.767) produced his famous biography of the Prophet Muhammad (the oldest complete work of Islamic historiography to reach us, albeit in redacted form), and the following decades saw a host of works on the early conquests, the first caliphs, etc. Structurally, these syntheses are compilations of discrete reports (*akhbar*) dealing with specific episodes, not continuous integrated narratives. On the other hand, the editors shaped their compilations in accordance with a conscious (although usually unstated) design and agenda. Midrange syntheses of this kind dominated Islamic historiography down to the late ninth century, and they never ceased to be produced altogether.

The early Abbasid period also witnessed a plethora of efforts to develop a reliable absolute chronology, although the first essays in this direction seem to have been made under the later Umayyads. Chroniclers naturally used the *hijri* calendar, traditionally instituted by the caliph Umar I in 642. But of course, events that had occurred before 642 had to be backdated, while the precise dates for a host of later events could only be guessed at. Nevertheless, Muslim historians quickly came to feel that precise dating was an essential element of their craft; the effort to pin things down and put them in the correct chronological order became a permanent characteristic of Islamic historical practice. By the 850s at latest, we begin to see annalistic chronicles of the kind long familiar in Byzantine historiography – viz., a year-by-year calendar of significant events (usually recounted in very summary fashion), beginning at a fixed point and coming down to the present. In the Byzantine tradition that fixed starting point was typically the Creation, while early Muslim historians favored the Hijra (CE 622). The annalistic structure of the chronicle was a rigid but very useful way of ordering events, and by the eleventh century, it had become by far the most widely used format in Arabic language historiography (Rosenthal, 1968).

The early ninth century witnessed the appearance of one last genre of synthetic historiography, the prosopography. The first major extant work of this class was the *Large Book of Generations* (*Kitab al-tabaqat al-kabir*) of Ibn Sa'd (d.845). His goal was to compile concise biographies of all those persons who had transmitted Islamic religious knowledge from generation to generation, beginning with the Prophet himself. The biographical entries in Ibn Sa'd's compilation seldom provided a detailed account of the events of a person's life, let alone any effort to probe the person's personality. Rather, they aimed at evaluating his (or her) religious standing and reliability as a scholar. Although his own book was little read until the eleventh century, Ibn Sa'd had clearly addressed a deeply felt need, for succeeding centuries (including the twentieth) saw a profusion of such works. In addition to countless biographical compilations dedicated exclusively to religious scholars, there were many others dealing with poets, men of letters, mystics, physicians, bureaucrats, and ultimately all those (including a number of women) who had earned a place within the cultural memory of Islam (Robinson, 2003).

By the last quarter of the ninth century, Muslim historians began to produce a series of grand syntheses, which claimed as their subject matter all of Islamic history, or even the history of the world since the Creation. Among many important works, pride of place undoubtedly belongs to the *Chronicle of Prophets and Kings* (*Ta'rikh al-rusul wa'l-muluk*) of al-Tabari (838–923). Apart from its methodological rigor, al-Tabari's compilation is distinguished by its vast scale, its meticulous attention to Biblical and Iranian history – Rome is conspicuous by its absence – and its inclusion of conflicting perspectives on the critical events of Islam's first 250 years. al-Tabari was a somewhat controversial figure in his own time, but his authority among later generations was immense. Most of his successors were content simply to abridge and condense his account of early Islamic history, but from him they did learn to place Islam within God's plan of creation and salvation by linking it to the religions and empires that had preceded it (Humphreys, 1991; Khalidi, 1994; Donner, 1998).

The Mature Tradition, 950–1800

By the time al-Tabari died, the Covenant–Betrayal–Redemption paradigm that had shaped historical discourse throughout the eighth and ninth centuries seemed only remotely connected to the issues now confronting Muslims throughout the world. Historians now confronted the collapse of the unitary caliphate and the rise of a host of warlord-dominated regimes throughout the Islamic lands – in short, the political disintegration of the community of believers. Moreover, the religious conflicts that had arisen in Islam's first two centuries could no longer be healed; by the mid-tenth century what had been fluid if bitterly contested allegiances were transmuted into rigidly defined sectarian divisions. Political and religious fragmentations were unwelcome facts, but facts they incontrovertibly were, and they deeply shaped the historical writing of the following centuries.

First, the new environment provoked a change in subject matter. In striking contrast to al-Tabari and his predecessors, historians now began to focus on recent and contemporary events rather than the community's early history. Likewise, historians tended to frame their work in local and regional rather than universal terms; their terrain was more often the history of Isfahan or Damascus than of the Islamic world as a whole. This emphasis on recent and regional or local events encouraged historians to adopt dynastic history as the framework for their narratives, for dynasties (and the warlords who created them) were the most visible political reality in their world. The turn to dynastic history was linked to new interpretive concerns. For historians observing the rise and fall of the warlord states, the central problem was not a ruler's role in the grand drama of salvation, but rather the reasons for the success or failure of his regime (Humphreys, 1991; *Encyclopaedia of Islam* sub verbo *ta'rikh*; Robinson, 2003; Hirschler, 2006).

Within this new historiographic culture, universal history – i.e., history that claimed to include the whole Islamic world since the time of the Prophet, or even the Creation – continued to be written, and in fact enjoyed a significant revival in the thirteenth and fourteenth centuries (Radtke, 1992). But even the finest work of this genre, the *Complete History* (*al-Kamil fi al-ta'rikh*) of Ibn al-Athir (1160–1234), is strongly inflected by

the distinctive concerns of its era. Within its strict annalistic framework is imbedded a quite visible sequence of dynastic histories. It does cover all the lands of Islam with remarkable balance and detail, but it does so by examining each region seriatim in its survey of the events of each year. Finally, its primary focus is the mundane political process and (implicitly) the pragmatic lessons that could be inferred from that process.

Two other universal histories of great originality are equally products of their time and place. The *Comprehensive Chronicles* (*Jami' al-tawarikh*) composed under the supervision of Rashid al-Din (d.1310), vizier of the Mongol empire in Iran and Iraq, is a work that embodies the aspirations to universal rule of the rulers for whom it was written, for it deals with the history of every person about whom Rashid al-Din could obtain any information. Even the usually despised and neglected Franks are included within his vast tableau. It is an irreplaceable encyclopedia of the historical knowledge available to Iranian scholars in the early fourteenth century. Finally, the *Book of Examples* (*Kitab al-'Ibar*) of Ibn Khaldun (1332–1406) is distinguished not only by its famous introductory volume (the *Muqaddimah*) but by a well-constructed, comprehensive, and analytic survey of peoples and cultures – a survey that nicely displays the socioeconomic acumen of its author.

Apart from these shifts in subject matter and emphasis, the mid-tenth century witnessed the bifurcation of historical writing into two linguistic branches. Arabic (the traditional language of Islamic scholarship) was now joined by Persian, the language spoken at the emerging princely courts of Iran and Muslim Central Asia (Meisami, 1999; Quinn, 2000). Arabic continued to be used throughout the Iranian cultural zone (which came to include Central Asia, Anatolia, and much of South Asia) for the religious sciences, but Persian rapidly supplanted it in other arenas: secular and religious poetry, government administration, didactic prose, and history. The use of Persian was more than a linguistic phenomenon, for Persian historiography quickly developed distinctive characteristics of its own – e.g., a preference for lengthy continuous narratives, an explicit appeal to the political precepts and institutions of ancient Iran, and a chronology that tends to focus on princely reigns rather than the annual calendar. By the eleventh century, Arabic and Persian historiography clearly embody two distinct traditions, each developing in its own way. This picture was further complicated by the emergence of Turkish as a major vehicle of literary expression in the late fifteenth century. From this point down to the mid-nineteenth century, Turkish language works were composed throughout the Middle East – no surprise, since the political and military elites from the Nile to northwest India were overwhelmingly of Turkish origin during that period. The main centers of Turkish literature were located in predominantly Turkish-speaking areas – Central Asia and the core Ottoman lands of Anatolia and the eastern Balkans. In spite of some specific characteristics of its own and many works of outstanding quality, however, Turkish historiography tended to model itself upon the Persian tradition, and in some regions, the two languages coexisted almost on an equal basis as vehicles of literary expression (Fleischer, 1986; Faroqhi, 1999).

The Transition from Islamic to European Models, 1800–1950

By 1800, the Muslim peoples of Asia and North Africa faced severe military and economic challenges from Europe. However, most Muslim polities (with the important exceptions of the Mughal Empire in India and the sultanates of Java) still retained their political independence, and the deep-rooted societal and cultural structures of the Islamic lands seemed intact. By 1900, however, almost every Muslim state had been swallowed up or made a client regime, and Muslim societies were enmeshed in massive, uncontrollable transformation on every level of life.

Change on such a scale inevitably compelled the creation of a radically new historiography, although the process was slow and complex. Works of great merit continued to be produced within the existing traditions throughout the first half of the nineteenth century. Indeed, excellent historical scholarship of a decidedly traditional cast continued to be produced well into the twentieth century. The best historians were fully cognizant of the new world they inhabited, but for many decades, traditional historiographic forms and approaches seemed adequate to the task. By the 1870s, this was no longer the case for many writers. First, existing models of historical writing simply could not address the cultural and ideological dimensions of the European challenge. No less important, by this time, many Muslim intellectuals had studied in Europe or with European teachers, and they felt the powerful allure of Enlightenment and post-Enlightenment thought. To them it was self-evident that European military and economic power was grounded in the power of European ideas (Hourani, 1962).

European ideas and literary models were easier to perceive than to internalize, and the late nineteenth century witnessed a difficult struggle by Muslim intellectuals and scholars to articulate new approaches to historical knowledge. Most late-nineteenth-century historical writing is in some sense a hybrid product. The point is illustrated by two major works, both marked by broad scope, critical use of documents, and awareness of European scholarship. Ahmet Cevdet Pasa's history of the Ottoman Empire (12 vols.: 1855–84) adheres to the traditional chronicle form, while Ali Mubarak's historical geography of Egypt (20 vols.: 1886–88) is broadly modeled on a classic work by the fifteenth-century Cairene scholar al-Maqrizi (d.1442). A model for historiography in a modern (i.e., European) style was provided by the *History of Islamic Civilization* (*Ta'rikh al-tamaddun al-islami*, 5 vols.: 1902–06) of Jurji Zaydan, a Syrian Christian novelist and man of letters. For both political and cultural reasons, Zaydan had no imitators, and only after World War I did Middle Eastern historiography – particularly in the new Turkish Republic and Egypt – begin to adhere systematically to contemporary European modes of research and presentation. This shift was more visible and consistent in works dealing with modern history (Delanoue, 1982; Crabbs, 1984; Di-Capua, 2009).

In both Turkey and Egypt, the new approach was strongly encouraged and to some degree controlled by the regime. Atatürk established an official historical society, which generated a nationalist interpretation of Ottoman, and modern Turkish history, which was almost uncontested down at least to

the 1970s. In Egypt, King Fu'ad (1917–35) oversaw a similar enterprise, but did so by hiring a number of European scholars to create a narrative of Egypt's rapid path to modernization under the strong leadership of its nineteenth-century viceroys (who also happened to be his own ancestors). Alongside this official initiative, however, emerged a cluster of Egyptian academic historians who strove to pursue an independent path. They were trained at the new King Fu'ad (now Cairo) University under the aegis of Shafiq Ghurbal (d.1961), himself trained at the University of London. By the end of the 1930s, even studies of early and medieval Islamic times were brought within the new framework. The 'Europeanization' of historiography affected not only research methods and literary structure but also the kinds of questions that Muslim scholars asked about their past. Even where (for religious or political reasons) they rejected the frames of reference and interpretations put forward by European historians, they could not avoid wrestling with the problems that these scholars had defined (Di-Capua, 2009).

This transformation in approach clearly reflects the professionalization of history after World War I – a sharp departure from traditional practice in the Islamic world. This process began with the establishment of European-style universities in Cairo and Istanbul just before the war, along with the creation of national societies for historical research. Simultaneously, history was enlisted in the struggles for national independence and cultural autonomy of the interwar and postwar periods. Moreover, by World War I, a small but growing number of Muslim scholars were taking advanced degrees from the leading universities in Europe; the prestige and authority that they enjoyed when they returned home in effect imposed the new model of historical thought and writing on their students.

Cross-cultural influence in historiography has not flowed in a single direction, however. Even in the 1920 and 1930s, a few Muslim scholars published their work in Western languages, and since the 1950s, this trend has grown enormously. A growing number of scholars from Islamic Asia and Africa have not only taken their advanced degrees in Europe and North America but also been appointed to many of the most prestigious teaching posts there. This situation has begun to create a real dialogue among a plurality of theoretical and cultural perspectives. Even though the methods and practices of traditional Islamic historical writing have all but disappeared, the history of the Islamic world has increasingly fallen again into the hands of its own scholars – the natural state of things, perhaps, but one that was hardly the case in the nineteenth and twentieth centuries.

Historical Thought and Historiography: Jewish Tradition

Abstract

This article combines a brief analysis of premodern Jewish historical traditions from the Hebrew Bible and Rabbinic sources to sixteenth-century chronicles with a stronger emphasis on modern Jewish historiography as it emerged in the early nineteenth century. It points to the fact that modern Jewish historiography did not grow out of earlier Jewish historical traditions but rather out of the critical approaches that characterized the early nineteenth-century German academic environment. During the nineteenth and twentieth centuries several schools of Jewish history writing developed, usually influenced by their immediate environment.

Biblical Traditions of History Writing

Together with the historical traditions of ancient Greece the Hebrew Bible contains the oldest corpus of historical writings. While not all of the various books, which entered the Jewish biblical canon reveal a strong sense of history, quite a few – such as Samuel, Kings, and Chronicles – are primarily historical accounts. In contrast to the Greek historians, the authors and editors of the Bible were interested not in recording history but in giving a theological sense to history. The numerous biblical passages which command the Jews to remember (*zakhor*) do not imply a special interest in history itself but express a definition of the Jews as a historical people held together first and foremost by its will to observe its historically revealed laws and to remember its common history. God is described in terms of His historical deeds. He is the 'God of the fathers' and 'Your God who brought you out of the Land of Egypt.'

With the canonization of the Hebrew Bible in the second-century Christian Era (CE) Jewish historical writing undertakes a clear shift. The first-century CE produces the last major Jewish historical writings for about 15 centuries. In a historical work, of which only two out of five parts survived, Philo of Alexandria describes the persecution of Egyptian Jews by the Roman governor Flaccus and the delegation of Alexandrian Jews (including himself) to the emperor Caligula. The most important historian in this period is Flavius Josephus, whose account of the Jewish War against Rome in CE 66–73 was written a few years later in Roman exile and – together with his *Antiquities* – stands in the tradition of Roman rather than Jewish historiography.

Historical Thought in Rabbinic Literature and Medieval Sources

There is hardly a more telling symptom for the decline of Jewish historical writing than the fact that Josephus' histories fell into oblivion among the Jews during the Talmudic period. The same holds true for many historical accounts, which did not enter the Jewish Biblical canon, such as the Books of the Maccabees, which describe the rise of the Hasmoneans against Hellenism. Preserved by non-Jews, they were rediscovered by Jews only in the sixteenth century. During the Middle Ages the history of the Second Temple period – beyond the Biblical accounts themselves – was known among Jews in rather distorted versions of the original accounts, such as the *Book of Antiochus* and the tenth-century *Book of Yossipon* (believed to be Josephus' original account), both produced in southern Italy.

The Talmud, which was to become the single most important source for Rabbinic Judaism over the centuries, is unhistorical in its nature. Although this vast corpus contains quite a few passages of historical value, its editors reveal no special interest in the chronology of events. Thus, rabbis of different centuries are made to engage in conversations, and biblical events are often presented out of their chronological order.

Medieval Jewish historical thought is framed by the memory of the biblical past on the one hand and by the longing for a messianic future on the other hand. The time span between a golden past and an ideal future is usually interpreted with clear reference to the biblical course of events. Biblical place names like Ashkenaz and Sefarad designate European countries, Christianity is Edom, and Islam is Yishmael. Vicious rulers are called Haman, like the archetypical biblical villain from the Book of Esther, and saviors are termed Mordechai after the hero of the same story. Messianic expectations led to concrete calculations about the End of the Days, and contemporary tragedies were often seen as the birth pangs of the Messianic Age.

Altogether, traditional Jewish historical thought as expressed in Rabbinic literature and medieval sources reveals at least a partly cyclical understanding of time. Every year when celebrating Passover observant Jews remember the exodus from Egypt, and during three annual days of fasting they mourn the destruction of Jerusalem. Each rescue from persecution is regarded a new Purim (in commemoration of the Book of Esther). Every Sabbath morning a weekly portion of the Pentateuch is read in the synagogue, thus reviving sequentially each year the historical accounts of the Five Books of Moses.

The most prominent genre of historical writing during the Middle Ages was the chronologies, which often tried to establish a reliable 'chain of tradition' (*shalshelet hakabbala*) from Moses through the leading Rabbis of the Mishna and Talmud and up to the authors' own time and place. They constituted a refutation of the anti-Talmudic challenge made by the Karaite sect and at the same time underlined the importance of the local Jewish community in which they were produced.

Examples of this genre are the *Letter of R. Sherira b. Hanina* from the academy at Pumbedita in Babylonia, who in the late tenth century responded to scholars from Kairouan, and the twelfth-century *Sefer Hakabbala* (*Book of Tradition*) of the Spanish scholar Abraham ibn Daud. A stronger emphasis on contemporary events can be seen in the detailed accounts of the Crusade massacres concerning the cruelties, which befell the Jewish communities of the Rhineland in the eleventh and twelfth centuries.

Among the most popular sources reflecting medieval and early modern Jewish historical thought in Central Europe were Memor Books, which contain collections of prayers together with a necrology of distinguished persons, and recorded local martyrs and persecutions. The oldest known Memor Book is from Mainz and dates back to 1296. A few hundred Memor Books are extant, mainly from seventeenth-century rural communities in southern Germany.

Sixteenth-Century Jewish Historiography as a Response to Catastrophe

The sixteenth century saw a sudden upsurge of Jewish historical writing with the publication of 10 important historical works, more than all of those known to us from the Middle Ages. Quantitatively as well as qualitatively the development was significant, with a new interest in history itself, as Yosef Hayim Yerushalmi demonstrated in his seminal study *Zakhor* (1989). Writers like Yosef ha-Kohen, Abraham Zacuto, and Samuel Usque wrote in the wake of the expulsion of Jews from Spain and Portugal (1492 and 1497), which affected not only their own lives but also completed the wave of expulsions of Jews from Western Europe. The new search for explanation is apparent in their writings, perhaps most pointedly in Solomon ibn Verga's *Shevet Yehuda* (The Staff of Judah, 1554), but also in the historical oeuvre of the only Ashkenazic author of this group, David Gans from Prague. His *Tsemah David* (Offspring of David, 1592) contains the most precise account of Jewish and world history undertaken by a Jewish author until that time.

The Italian Jew, Azaria de' Rossi, who completed his *Me'or Enayim* (A Light to the Eyes, 1573–5) at about the same time, has the merit of recovering ancient sources that had been lost to Jewish tradition because they did not enter the biblical canon. Among them are works by Philo of Alexandria and the apocryphal *Letter of Aristeas*. For the first time the historical interest of Jewish writers did not concentrate on the biblical past or speculations about the messianic future but dealt with the concrete history of the Jews during recent centuries and in their own time. These authors also showed a genuine interest in the histories of other nations. The impact of their work on later Jewish historiography was, however, minimal. It was only as a result of the encounter with academic scholarship in the early nineteenth century that modern Jewish history writing developed.

The Beginnings of Modern Jewish Scholarship and Critical Historiography in the Nineteenth Century

The beginnings of modern Jewish scholarship can be dated to the small circle of Jewish university students from Berlin who founded the *Verein für Cultur und Wissenschaft der Juden* in 1819. Leopold Zunz, the leading spirit of this group and the dominant figure in the field, which would become known as *Wissenschaft des Judentums*, published in 1818 a systematic agenda for modern Jewish research under the title *Etwas ueber die rabbinische Literatur* (*On Rabbinic Literature*). The study of history, which had been marginal in the works of eighteenth-century Jewish enlighteners (*maskilim*), now became a central pillar of Jewish scholarly enterprise. From the beginning, a certain apologetic character was inherent in many attempts at reclaiming the Jewish past. As Immanuel Wolf, a founding member of the *Verein* expressed it: "Scientific knowledge of Judaism must decide on the merits and demerits of the Jews, their fitness or unfitness to be given the same status and respect as other citizens."

In a more direct way, the scholarly studies of Leopold Zunz served as instruments to achieve emancipation for German Jews. Like Wolf, Zunz believed that 'the equality of the Jews in customs and life will follow from the equality of *Wissenschaft des Judentums*.' In his *Gottesdienstliche Vorträge der Juden, historisch entwickelt* (1832), he documented the long tradition of Jewish sermonic literature, thus rebutting the Prussian government's dismissal of German synagogue sermons as innovations in Jewish liturgy. Five years later, in his study on Jewish surnames, *Die Namen der Juden*, Zunz proved the ancient origin of many 'non-Jewish' names among Jews and thus reverted to a decree that forbade the use of Christian first names among Jews.

It would, however, not do justice to the enormous enterprise of nineteenth-century *Wissenschaft des Judentums* to view it predominantly under the aspect of apologetics, as did later critics, especially Zionists, most prominently Gershom Scholem. Another important motif for the pioneers of Jewish historiography was to retrieve the lost treasures of the past for a rapidly assimilating Jewish community as a means of strengthening their particular identity as modern Jews. As Yosef Hayim Yerushalmi writes, "History becomes what it had never been before—the faith of fallen Jews" (1989: p. 86). Finally, the purely scholarly interest in the Jewish past at a time in which history writing and reading became one of the most popular intellectual endeavors should not be disregarded.

There was no bridge between those first scholarly accounts of Jewish history and earlier Jewish writing. It was through the non-Jewish world that historiography entered Jewish writing. Consequently, it was not a Jew, but a Protestant French author in Dutch exile, Jacques Basnage, who wrote the first multivolume postbiblical Jewish history. He characterized his *Histoire du peuple Juif depuis Jésus Christ jusqu'à présent* … (1706–11, rev. ed., 1716–21) in his subtitle as a continuation of Josephus, and there was indeed some truth to this statement. To be sure, his account would in no way measure up to modern scholarly standards, and was still full of missionary intentions, but it was nevertheless the first serious attempt to write a comprehensive postbiblical Jewish history.

Political Agendas and the Writing of Jewish History

The first Jewish writer to embark on such an endeavor was Isaak Markus Jost, a member of the *Verein für Cultur und Wissenschaft*

der Juden and one of the pioneers of *Wissenschaft des Judentums*. The modern secular education he received as a student at Berlin and Goettingen is visible in his attempt to present a sober and objective view of Jewish history in his nine-volume *Geschichte der Israeliten seit der Zeit der Maccabäer bis auf unsere Tage* (1820–28). Jost's work is clearly centered on the German–Jewish experience and draws a picture of Judaism as a religion, which has lost all its original national characteristics. Depicting modern Jews as a purely religious community was part of the larger German–Jewish struggle for Emancipation. The title of his later work, the three-volume *Geschichte des Judentums und seiner Sekten* reveals the urge to present Judaism as a religion analogous to Christianity.

When Heinrich Graetz wrote his 11-volume *Geschichte der Juden von den ältesten Zeiten bis auf die Gegenwart* – the most popular such history ever written – one generation later (1853–76), he deviated from the early works of *Wissenschaft des Judentum* representatives in his stronger emphasis on the existence of a Jewish people and by a more passionate presentation. Although he was later claimed as a proto-Zionist writer, it is important to note that his definition of the Jewish nation is that of a community held together by an essentially religious idea. Like Jost, for whom modern Jewish history begins with the enlightened Prussian monarch Frederick the Great, Graetz located the beginnings of Jewish modernity in Germany, with the appearance of the philosopher Moses Mendelssohn and the Berlin Jewish Enlightenment.

It was not until the late nineteenth century that a clear break from the earlier Germanocentric view of Jewish history and from the strong emphasis upon a 'history of suffering and scholarship' (Graetz) appeared in the work of the Russian-Jewish historian Simon Dubnow. His 10-volume *World History of the Jewish People* was written in Russian but published first in German translation (1925–29). Motivated partly by his own political agenda – he was the founder of the autonomist Jewish movement which represented Jewish diaspora nationalism in Eastern Europe – his version of Jewish history centered on institutions of Jewish life in the diaspora, most notably the *kehilla*, the semiautonomous Jewish community.

Dubnow was also among the founders of the YIVO Institute for Jewish Research – an institution established in Berlin and Vilnius in 1925 to systematically research the Jewish past and present in Eastern Europe and other Ashkenazic communities. In contrast to the traditional German dominance of nineteenth-century *Wissenschaft des Judentums* and to Hebrew-language Zionist scholarship, the YIVO deliberately presented its research in Yiddish, the language spoken by the Jewish masses of Eastern Europe.

From the end of the nineteenth century, Jewish historiography was increasingly influenced by new subdisciplines of *Wissenschaft des Judentums*, such as ethnography, sociology, and demography. The *Gesellschaft fuer Juedische Volkskunde*, a society of Jewish folkloristics founded in 1898 and led by the Hamburg rabbi Max Grunwald, played a pioneering role in the scholarly research of Jewish folk traditions around the globe. Its journal, the *Mitteilungen fuer Juedische Volkskunde*, published the most important findings in the field for almost three decades (1898–1929). In Russia, an expedition to the traditional communities of the Ukraine led by the playwright and folklorist An-Ski from 1912 to 1915 was the culmination of a long search for the remnants of rural Jewish life.

Jewish demographers created their own institutional framework when they established an Office for Statistics among the Jews in Berlin, which from 1904 published its own journal and was closely related to the burgeoning interest in Jewish sociology best expressed in the pioneering works of Arthur Ruppin. Most of these endeavors were clearly related to the 'Jewish Renaissance' propounded by the emerging Zionist movement. Zionist scholars reacted against what they alleged to be the orientation of nineteenth-century Jewish scholars exclusively to the Jewish past and broadened their interest to include contemporary issues within their research.

After the establishment of the Hebrew University in 1925, scholars with a Zionist outlook formed a vaguely connected group of Jewish historians, sometimes referred to as the 'Jerusalem School,' emphasizing the centrality of Palestine in the course of Jewish history. Their most outspoken representative was the later Israeli minister of education Benzion Dinur (Dünaburg), who in 1935 helped to establish the most important Hebrew-language historical journal, *Zion* (an earlier series of the journal had been aborted), together with the first professor of Jewish history at the Hebrew University in Jerusalem, German-born Yitshak (Fritz) Baer.

From the very early works of Zionist historiography, usually written by Zionist activists who were not professional historians (such as Nahum Sokolov and Adolf Böhm), a teleological view of history leading to the return to the Jewish homeland is clearly visible. At the same time, the Jewish past in the Land of Israel is placed in the center of interest at the expense of diaspora history. In contrast to most historians, Benzion Dinur thus commences the period of exile not with the destruction of the Second Temple in the first-century CE but much later, with the Muslim conquest of Jerusalem in the seventh-century CE. In a similar vein, he concludes the period of diaspora domination as early as 1700, when a group of pious Jews from Eastern Europe made their way to Palestine. In his *History of Zionism, 1600–1918* (1919) Nahum Sokolov anachronistically dates the Zionist movement back to the seventeenth century.

While Dubnow's conception of Jewish history represented a corporate view of Jewish diaspora life and the Jerusalem School emphasized the centrality of Palestine, the last historian who attempted a single-handed multivolume universal Jewish history, Salo Wittmayer Baron, stood for a more positive approach to individuals' diaspora experience. His 16-volume *A Social and Religious History of the Jews* (1952–76) reaches only the year 1650. His more affirmative view of the diaspora was certainly influenced by his own experience of spending most of his life in the United States, where he was appointed in 1930 as the first professor of Jewish history at a Western university, Columbia University in New York.

Jewish historiography has thus to a large extent been determined by the political context, the geographical situation, and the ideological and religious outlook of the respective historians. Since all these factors differed considerably in the Jewish world, the outcome was a highly diverse array of Jewish historical writing – even though, at least up until the second half of the twentieth century, most of those who undertook to write Jewish history were themselves Jews. The destruction of European Jewry, the establishment of the State of Israel, and the flourishing of Jewish studies in the United States led to an entirely new situation for Jewish historiography after World War II.

Twentieth-Century Trends

With the exception of Baron no single historian embarked on a monumental Jewish history project in the tradition of Jost, Graetz, and Dubnow in the course of the twentieth century. There were a few attempts to publish Jewish world histories as collective enterprises, as early as the ambitious plan developed by Ismar Elbogen of the Berlin *Hochschule für die Wissenschaft des Judentums* in the late 1920s; these, however, fell victim to the economic and political crisis of the early 1930s. More successful, but for financial reasons also never completed, was a multi-volume project initiated by scholars of the Hebrew University.

After World War II Jewish history became more and more a field for specialists who would concentrate on limited areas and periods. This tendency toward specialization was also the result of an increasing professionalization and acceptance of the subject as a distinct field to be taught at university level, with new centers emerging in Israel and the United States. Until the 1960s, the teaching of Jewish history in the US had been restricted to a handful of universities and a few institutions with a strong emphasis on Jewish education, such as rabbinical seminaries and Jewish teachers' colleges or the Jewish-sponsored Brandeis University. With the establishment of new Israeli universities the singular role of the Hebrew University in Israel diminished, while a true explosion in the field of Jewish studies enabled a similar diversification at American universities beginning in the 1970s. European institutes of higher learning followed to a more modest degree in the 1980s and 1990s. By 2000, Jewish history had become a highly specialized and diversified field represented at almost every major institution of higher learning in the United States and many European countries.

This development led to a more complex picture of Jewish historiography. The personalities and political programs of individual historians and the formations of more or less clearly defined schools no longer dominate the professional scene. Zionist historians who had fought an ideological battle over Jewish history, mostly against their non-Zionist Jewish colleagues, up to the 1930s were essentially left without opponents as a result of the Holocaust and the destruction of alternative Jewish options, such as diaspora nationalism and Bundist socialism. In the State of Israel, apologetical historiography (now mainly directed against Arab and British versions of the history of Palestine) did not entirely disappear but was more and more balanced by the emergence of a younger generation of historians, by whom the existence of the Jewish state was already taken for granted. This resulted in a gradual break with long-accepted notions rather than an intellectual revolution as more and more historians and sociologists of a new postwar generation attacked the older schools of Zionist historiography in the 1980s and 1990s.

While mainly questioning issues of Israeli history or prehistory, such as the role of the Zionist leadership in Palestine with respect to attempts at the rescue of European Jewry in World War II, and the accepted notions surrounding the first Arab–Israeli War in 1948–49, the views of the so-called 'New Historians' also challenge more general Zionist notions of Jewish history. In a highly politicized context the two sides of the 'Israeli Historians' Debate' stand not only for different views on Jewish or Israeli history but mark also different paths for Israel's political future. In contrast to Israeli historiography, which has been dominated by a classical left-liberal Zionist intellectual establishment, the 'new' historians and sociologists often represent a post-Zionist stance and as such constitute a major challenge to the master narrative of Jewish and Zionist history.

In the last decade of the twentieth century, Jewish historiography moved from its early Germanocentric and later Eurocentric emphases to a stronger integration of widely neglected communities. In particular, the histories of Jews in the Muslim world have slowly been integrated into the general picture. This is partly the result of the emergence, mainly in Israel, of historians of oriental background, but also of the establishment of a few academic positions concentrating on Sephardic Jewry at American universities. It was in the United States, where the history of Jewish women emerged as a subfield of gender studies, with significant publications in the 1990s about Jewish women in Imperial Germany and in the United States, and a historical encyclopedia of Jewish women. New trends among general historians, including postmodern ideologies, have also left their imprint on Jewish historiography.

Europe, too, witnessed a revival of Jewish historical scholarship in the 1990s. The larger Jewish communities of Western Europe, France and Britain, emerged as new centers of Jewish scholarship, although most of the historical studies there deal with their respective national Jewish histories. Central and East European institutions relating to the Jewish past were destroyed by the Nazi onslaught, together with those who participated in them. Ironically, the Nazis entered into much more systematic Jewish historical research than non-Jewish scholars had done in the Imperial and Weimar periods; they established research institutes for Jewish history in Munich, Frankfurt, and Berlin. Studies undertaken there, however, were preoccupied not with Jewish history per se, but with the so-called 'Jewish Question' and sought to justify Nazi discrimination and persecution against the Jews from a pseudo-scholarly perspective.

It is interesting to note, though, that some of the research begun there – especially on the Court Jews and on Sephardic Jews in Hamburg – was published with only slight alterations in the 1950s. More modern Jewish historical research in Germany developed as a result of the establishment of the first Jewish Studies institutes and of the emergence, starting in the 1960s, of a new interest in German–Jewish history among modern German historians. While Jewish history is mainly written by Jewish historians and for a Jewish public both in prewar Europe and in today's Israel and America, the postwar European situation is different. With only small Jewish communities, research is mainly undertaken by non-Jewish scholars, and mainly read by non-Jews.

Major Issues in Modern Jewish Historiography

Perhaps even more than scholars of other particular histories Jewish historians have been divided by a set of fundamental questions. First of all, there is the question of whether Jewish history exists at all or whether the history of Jews merely constitutes a chapter within the histories of the nations among whom they lived. If Jewish history exists in a broader sense, the question arises whether it is the history of a people or a purely

religious history – or whether at some point the national history turned into a religious history. Finally, an additional problem of Jewish history is its theological interpretation by some modern Jewish and non-Jewish thinkers, which makes Jewish history appear as though it escapes the regular laws of history. This last argument is strengthened by the conspicuous role of anti-Semitism throughout the centuries and the claim of the uniqueness of the Holocaust, which brought about the near destruction of European Jewry.

The doubt whether Jewish history exists per se seems rather superfluous in an age of expanding programs in Jewish history and within the framework of an article discussing the rich tradition of Jewish history writing. Nevertheless, one can still find this opinion among some modern historians. It is based partly on the Christian theological notion that active Jewish history came to an end with the early stages of Christianity, and partly on the secular claim that Jews lack a clearly defined political history based on a common territory. In the nineteenth century such a belief was inherent in the theological characterization of ancient Judaism as 'late Judaism,' while on the other side of the spectrum of historical outlook Marxist historians denied a separate course of Jewish history on the basis that Jews not only lacked a territory of their own but also a division into classes of society in the modern period. Nowadays, the questioning of the existence of a Jewish history throughout the ages is less explicit. More indirectly, however, such a view can be detected in the almost exclusive interest of many historians in the histories of the Jews in their respective societies. Thus, German Jewry or French Jewry is often seen as isolated entities, as part of German or French history, but without any connection to the developments of other Jewish communities. On the other hand, there has been a contrary tendency among some Zionist historians to neglect the respective contexts of Jewish histories and view them only through a national Jewish perspective.

If we accept the notion that Jewish history exists as such and is stretched over numerous centuries and over five different continents, the question remains whether it is primarily a national or a religious history. The pioneers of Jewish historiography in nineteenth-century Germany often preferred to depict Jewish history in terms of the development of a religious idea (the purest form of monotheism) and its bearers. This concept was in line with the demands of Emancipation that Jews integrate into European societies as citizens who only differed in their religious creed. Thus, the notion of a Jewish people was characterized as an ancient idea long left behind. With diaspora nationalists like Simon Dubnow and the emerging Zionist school the national element was restored to Jewish historiography. Both schools emphasized that Jews never ceased to constitute a nation even if they lacked their own territory. Dubnow went so far to stress that a nation that had overcome the need for its own territory constituted the highest and most sophisticated form of nationalism. Zionists, on the other hand, emphasized the unbroken longing for return to the Land of Israel and the use of the Hebrew language over the centuries.

A final peculiarity of Jewish history is the theological weight it enjoyed especially in a Christian context. In medieval and early modern Europe Jews often constituted the only non-Christian minority. The traditional position Jews enjoyed in Christian Europe was a mixture of protection and discrimination. Jews served as the classical 'other,' being protected because they bore testimony to Jesus Christ while at the same time discriminated against as Christ-killers and as unbelievers. On the basis of this peculiar role, many Christian authors of postbiblical Jewish history regarded this particular history as outside the course of 'regular' history. They claimed accordingly that it should be judged by theological rather than historical criteria. On the Jewish side, the most prominent proponent of a Jewish '*Sonderweg*' theory, albeit with a different background, was the philosopher Franz Rosenzweig, a student of Friedrich Meinecke, who stressed in his main work *The Star of Redemption* (1921) that general rules of history do not apply to Jewish history. More recently, the discussion of the uniqueness of the Holocaust has brought the question of a peculiar course of Jewish history to a different level. In this view, it is not Jewish history that is incomparable to other histories, but rather the persecution of the Jews, which culminated in the attempt of their total annihilation.

In his programmatic and provocative essay, 'Ghetto and emancipation' (1928), the historian Salo Baron fiercely objected to what he called a 'lachrymose version of Jewish history.' At the beginning of the twenty-first century, and half a century after the greatest tragedy of the Jewish people, numerous voices once again express their reservations against a one-sided picture of Jewish history reduced to a history of persecution. While they stress the importance of research on anti-Semitism and the Holocaust, they also warn not to read Jewish history backwards starting from its most tragic chapter.

Abstract

The article offers a brief survey of the main currents of historical thought and writing in the West since the eighteenth century. It begins with the emergence of a secular outlook in Enlightenment approaches to history. It then proceeds to the transformation of historical studies in the nineteenth century marked by professionalization. Strongly influenced by the work of Leopold von Ranke, historians saw their discipline as a science (Wissenschaft), scientific in the sense of reliance on the critical examination of the sources, distancing itself from nonprofessional amateur historians. Its approach to historical presentation in the form of narrative focusing largely on political events and political leaders differed sharply from broader generalizing approaches as represented in the philosophies of history in very different forms by Georg Friedrich Hegel, Karl Marx, and Auguste Comte. Although Ranke maintained a European perspective, his followers largely saw history in the service of the national state and nationalism. The Rankean paradigm, which became the basis of history as an academic discipline worldwide, was challenged in the first part of the twentieth century by new social science-oriented approaches that moved from narrative to the analysis of social structures and processes of change. They shared with the older paradigm the conviction that there was an objective historical past that could be known and that history had direction and coherence culminating in the modern world. These two interrelated conceptions were challenged in the last third of the twentieth century and the beginning of the twenty-first century by social scientists and particularly humanists who questioned the possibility of scientific objectivity and called for the replacement of the Eurocentrism of much of professional historiography up to that point by a global perspective that gives proper attention to gender and to ethnic and social diversities.

Reorientation of Historical Thought in the Eighteenth Century: The Emergence of a Secular Outlook

There is good reason for beginning this article on Western historical thought and historical writing in the modern age with the eighteenth century. The Western tradition is much older, going back at least to the Hellenic Age. There is much continuity between the older traditions, particularly those of the humanistic historiography of the Renaissance and historical writing in the eighteenth century. However, there are also profound changes in the conceptions of history and of historical knowledge and in the institutional context in which history is written that mark a sharp break with previous periods.

Henri Berr and Lucien Febvre in the article 'History' in the first edition of the *Encyclopedia of the Social Sciences* in 1932 identified two characteristics of the modern conception of history as basic to the modern historical outlook and practice: the commitment to establishing the 'truth' and to placing historical accounts within 'universal history.' A third is the transformation of historical studies into a professional discipline. The older ancient and humanistic historiography, they argued, saw history as a form of rhetoric in the service of politics and morality and as an art form. 'History as it is conceived today,' they noted, 'may blossom into art, may be crowned with philosophy; but it is primarily and necessarily the solid establishment of facts' (Berr, p. 358), however difficult this may be.

This formulation presupposes a sharp distinction between history as literature and as a scientific discipline, even if its approach to science takes into account the elements of contingency and particularity that distinguish history from the generalizing natural sciences, but it assumes that historical accounts based on a solid factual basis narrate a coherent development that reflects historical reality. There is a good deal to be said for this description of the transformation that historical studies underwent in the eighteenth century and particularly in the nineteenth century, but especially from the perspective of today it seems one-sided and incomplete.

On two levels, historical thought and historiographical practice in the eighteenth century moved toward greater historical realism. On the one hand, an increasingly secular outlook insisted on the exclusion of the supernatural and held that historical explanation must not violate a common understanding of natural reality. This secular approach was relatively new in the eighteenth century. On the other hand, it coexisted often with a residual religiosity, as it still did even in the nineteenth century with a conception of a hidden divine plan, as in Leopold von Ranke's trust in the 'hand of God' (2011, p. 87), or in a less hidden form in G. W. F. Hegel's dialectic. Thus Enlightenment historians such as J. C. Gatterer and A. L. Schloezer did not challenge the biblical chronology or the biblical account, although for the postbiblical period, or for the nonHebraic ancient peoples, they insisted on an approach in accord with natural reality. Apart from the great works of synthesis in the eighteenth century, David Hume, Catharine Macaulay, Montesquieu, Voltaire, Edward Gibbon, G. T. Raynal, and Adam Ferguson, there exists a tradition of erudition that introduced standards of source criticism, which went back to the humanist scholarship of the Renaissance and Reformation and to the erudition of seventeenth-century historical scholarship. The belief that great philosophic works of synthesis are not enough, and that scholarly history cannot be written until the authenticity and veracity of the sources on which it rests have been established, expressed itself in the great

 http://dx.doi.org/10.1016/B978-0-08-097086-8.62033-0

methodical collection of sources begun in the seventeenth century with the Jesuit *Acta Sanctorum*, published after 1643, to provide a firm basis for ecclesiastical history, and with Ludovico Muratori's efforts in the *Scriptores rerum italicarum* (1723–51) to lay the foundation for an Italian national history. The German scholars at the universities, first J. L. Mosheim and J. S. Semler at Halle and then J. A. Ernesti and J. O. Michaelis at Göttingen, established a tradition of historical exegesis that laid the foundations for historical hermeneutics and the new discipline of historical philology that emerged in the latter part of the eighteenth century and became the key elements of the critical method of B. G. Niebuhr and Ranke in the nineteenth century.

A key concept of eighteenth century thought was the linear character of history. History was no longer understood as a cumulation of events but as a continuous story possessing inner coherence. Reinhart Koselleck has suggested that between 1750 and 1850 the concept 'history' (*Geschichte*) replaced that of 'histories' (*Geschichten*). Each of the great historical works of the eighteenth century followed a continuous, coherent story whether in Gibbon's *Decline and Fall of the Roman Empire*, Hume's *History of England*, or Voltaire's *Essai sur les moeurs*.

The conception of world history that arose with the Enlightenment constituted not only an extension of the historical outlook but at the same time also a narrowing. This conception dominated almost all of Western historical thought and historical writing until well into the second half of the twentieth century. The history of the world was identified with the history of civilization and the latter rather narrowly with that of the West. Two variations emerged in the conception of what constituted world history, one identified with Condorcet, centering on an idea of progress on a world scale, and the other identified with Herder, which stressed the diversity of peoples and cultures. On closer examination, these two conceptions shared many characteristics, specifically in their stress on development.

The Enlightenment has too many aspects to permit one to reduce it to a simple formula. Two ideas were central to it, but neither was free of contradictions. The first assumed the essential equality of all human beings in all cultures; the second maintained that only human beings who had attained a high degree of culture and education deserved to be free and equal citizens. The latter view distinguished between societies that were in the vanguard of civilization, understood as Western civilization, and less developed peoples. If G. W. Leibniz and Voltaire had still regarded China as a civilization equal and possibly superior to that of the West, Christoph Meiners considered the yellow peoples as inferior to Europeans, and the Blacks as barely different from animals. The notion emerged of a distinctive Western civilization with roots in classical Greece. J. J. Winckelmann's rediscovery of Greek art in 1764 contributed to an idealization of Greek standards of beauty and personal culture, which were adopted as models for a modern culture distinguishing the West from other cultures and giving it its superior standing. Meiners' scientific racism represented an extreme position, but the idea of the unique position of the West and the relative inferiority of all non-Western cultures and peoples became a central assumption in Western historical consciousness.

Nineteenth-Century Conceptions of History and Historical Science: between Romantic Historism and Scientistic Positivism

This outlook was dominant well into the twentieth century. It reflected the changes that had taken place in the world in political and military strength, economic power, and scientific and technological development. The two divergent historical outlooks in the first half of the nineteenth century, one represented by Hegel's dialectical philosophy of history and the other by Ranke's historism, shared this outlook despite their philosophic differences. Hegel's perception of the world as an ongoing dialectical process by which, through progressive contradictions, the absolute mind, reason, fulfills itself and takes on concrete forms in the institutional life of the modern European world, and specifically in the Prussian political and social order after the French Revolution and Napoleon, reflects its origins in specifically German political and philosophical traditions. However, it has parallels in less involuted intellectual currents of thought outside of Germany, from Turgot, Condorcet, and Thomas Paine in the late eighteenth century to Henri de Saint Simon, Auguste Comte, J. S. Mill, Thomas H. Buckle, Herbert Spencer, and Benedetto Croce in the nineteenth century. For all of them world history is the history of the European world, a world that for some may include the United States but for all excludes the Slavic peoples. For Hegel only the West has a history. China, India, and Persia may have been the earliest civilizations, but they have remained stagnant. According to Hegel, Black Africans are incapable of cultural creativity. Karl Marx with his conception of static Asiatic modes of production took over much of Hegel's conception of the inferiority of non-Western societies, and he and Friedrich Engels used this to justify Western imperialism as the only way to bring the non-Western world into the realm of modern civilization.

Theoretically, Ranke's conception of the historical world represented the antithesis of Hegel's. Ranke rejected the idea of progress as well as the schematization of historical development as it occurred in Hegel's philosophy of history. History for him deals with the particular and the contingent and avoids generalizations and determinism. In fact, however, Ranke saw history as a linear process at the culmination of which stood the postNapoleonic Western and Central European world. Ranke proclaimed that "every age is equally immediate to God" (2011, p. 21) but at the same time denied that China or India had a true history. Except for his early work on the Serbs, his writings dealt with the countries he defined early on as the Latin and Germanic. His incomplete *World History* is a history of the West.

Whatever the philosophical and political differences, nineteenth-century thinkers as well as the educated public generally turned to history as the key to understanding things human that replaced traditional philosophy. The charges, often repeated, that the eighteenth century, particularly the Enlightenment, ignored history, generalized, and moralized, and did not recognize individuality and uniqueness of historical contexts are disproved when we look at the great historical works of the eighteenth century, which we have already mentioned. Despite the impact of romanticism in the first part of the nineteenth century, with its stress on imagination and

poetry, a cult of science dominated historical study and writing, which was not necessarily in conflict with a romantic outlook. This search for a scientific approach to history took two different directions: one that has frequently been called positivism and the other historism, neither of which can easily be reduced to a common denominator. The first of these orientations took the natural sciences as its model. Building on Turgot and Condorcet, Auguste Comte sought to formulate laws of development by which societies moved from simpler to more complex forms of organization. The driving force was the transformation of knowledge from theological and then metaphysical stages to positive science that would provide the means for the scientific organization of society. However, positivism remained largely grand theory with little empirical application to historical inquiry. More significant was Karl Marx's approach to history. Marx saw the driving force of history in the lawful development of economic forces, which constituted the basis of historical transformation, and the revolt of this basis against the social, political, and intellectual superstructure. In the course of this conflict the contradictions within the social order, which involved inequality, would be overcome in a classless society. Marx thus intended to replace Hegel's idealist dialectic with a materialistic one. If positivism both in its Comtean and Marxist forms in its search for a scientific history envisaged a utopia at the end of history, the main currents of historical scholarship sought to avoid a speculative approach to history but nevertheless did not free themselves from metaphysical and even theological presuppositions that they refused to acknowledge. Ranke may perhaps serve as the most influential representative of this orientation. He too was committed to a strictly scientific approach to history. For him, however, this approach must recognize that general laws have no application to history that deals with the particular and the contingent. For him the task of the historian was to recapture the past as 'it actually was' (*wie es eigentlich gewesen*), free of any bias, requiring the application of philological methods to the critical analysis of the sources as F. A. Wolf and Niebuhr had applied them. However, for him history was more than the reconstruction of the past. It involved interpretation and synthesis, as it did for J. G. Droysen. Ranke was convinced that the particular event contained the general, and that the general became apparent to the researcher who immersed himself in the sources, because – and here we return from the realm of strict science to that of metaphysics – the historian can observe the general tendencies that manifest themselves in history, tendencies that do not represent God's direct intervention in the world, but nevertheless reflected divine purpose.

Professionalization of Historical Studies

The stress on the scientific character of historical studies led to the formation of a professional discipline of history. Professionalization was not restricted to history but was part of a process in which scholarly studies in all fields, the liberal arts, as well as the natural sciences, were institutionalized at centers of higher learning, primarily the universities and research institutes. The German model was imitated elsewhere, relatively early in France with the introduction of the German seminar method at the Ecole Pratique des Hautes Etudes in Paris in 1868 and in the United States with the introduction of a research-oriented graduate program at The Johns Hopkins University in Baltimore in the 1870s leading to a PhD. With some delay the German model was adopted in Japan, Great Britain, the Netherlands, Italy, Spain, Russia, Scandinavia, Greece, Romania, Latin America, and elsewhere, each time, it must be stressed, with major modifications that reflected different scholarly traditions. Thus, the sharp distinction between the cultural and the natural sciences that dominated German thought played less of a role elsewhere. A basic tenet of professional historians was the total objectivity or what Ranke called the 'impartiality' of the historian. In fact, however, the new discipline was highly politicized everywhere. This intensified interest in archival research went hand in hand with the wave of nationalism that gripped all Western countries and also modernizing non-Western countries such as Japan. The broad cosmopolitan view of many historians in the eighteenth century gave way to a new focus on national history. Ranke still wrote the histories of a variety of European states, Serbia, England, France, Prussia, and also the Reformation in Germany and the Papacy. Later historians, who took him as a model for their own scholarship, in most cases concentrated on their own nation.

However, the development of modern historical scholarship was not a German monopoly. The opening of archives and the collection of documents, primarily those of the Middle Ages, became a prerequisite for scholarly national history. In Paris the Ecole des Chartes was founded in 1821 to train scholars in the critical use of documents. Muratori's collection of Italian documents in the eighteenth century has already been mentioned; this was followed by the *Monumenta Germaniae historica* launched in Germany in 1819 and by similar undertakings in France, Great Britain, Spain, Poland, Bohemia, Greece, and elsewhere. The Rankean belief that immersion into the sources guarantees an impartial view of the interrelation among historical events turned out to be an illusion, something that was openly recognized by the scholars of the Prussian school such as Heinrich von Sybel, J. G. Droysen, and Heinrich von Treitschke who frankly saw historical scholarship as a tool for the legitimation and propagation of the German national cause under the Hohenzollern rule. Moreover, the process by which scholars were recruited guaranteed a high degree of homogeneity in social composition and political outlook.

Professionalization was not only to guarantee objectivity but also to provide a scientific or scholarly discourse distinct from the literature. Ranke had stressed the scientific character of history, but at the same time he also recognized that history combines science with art. The great prestige that history enjoyed everywhere in the nineteenth century – a number of the leading French statesmen from François Guizot to Alexis de Tocqueville, Alphonse de Lamartine, Adolphe Thiers, and Jean Jaurès were important historians – rested on the literary quality of their histories. History could not escape being literature, and imaginative literature at that. In fact there existed a close parallel between the great histories written by professional historians and the great realistic novels of the nineteenth century – Stendhal, Honoré de Balzac, Charles Dickens, Gustave Flaubert, Gottfried Keller, Gustav Freytag, Ivan S. Turgenev,

Fyodor Dostoyevski, and even Thomas Mann's *Buddenbrooks* (1902). They all constructed a plot that followed a temporal line and involved individual subjects as agents. The great historians of the century, Jules Michelet, Denis Fustel de Coulanges, Thomas B. Macaulay, and Theodor Mommsen, who in 1902 received the Nobel Prize for literature, were read as great literature, as was Ranke himself. Michelet is a striking example of the crossing of borders between critical scholarship and imaginative literature, the exhaustive mining of the archives for the purpose of creating a national memory and identity.

However, the role professionalization played in nineteenth-century historical writing should not be overestimated as it often has been. A great deal of history did not follow the dominant paradigm of narrative national history such as three of the most important and lasting works of the midcentury, Fustel de Coulanges's *La Cité antique* (*The Ancient City*), de Tocqueville's *L'Ancien régime et la Révolution Française* (*The Old Regime and the French Revolution*), and Jacob Burckhardt's *Die Kultur der Renaissance in Italien* (*The Civilization of the Renaissance in Italy*). Moreover, many leading writers of history such as Thomas Carlyle, Macaulay, John Green, George Bancroft, Lamartine, Louis Blanc, and, of course Tocqueville, were not professional historians.

The great literary histories of the eighteenth century, for example, those of Hume, Gibbon, and Voltaire, were intended to entertain, educate, and edify a broad educated public. Professional historians wrote often for specialists. In fact the division between literary and professional history and their audiences was not as deep as it may appear. Certainly Hume, Gibbon, and also William Robertson were serious scholars, and the great professional historians of the nineteenth century, such as Ranke, Fustel de Coulanges, Theodor Mommsen, and Lord Acton were read avidly by a broad public for whom history had become the key science replacing philosophy as a guide to understanding the human world.

Twentieth-Century Reorientations of Historical Thought and Scholarship: The Turn to the Social Sciences

Outside the discipline proper, critical methods were applied to many areas: the history of religion (F. D. Strauss, Ernest Renan), the history of law, the history of literature and art, and other fields. While the historians proper neglected the study of society and economics, an important group of economic historians, the so-called Historical School of National Economy in Germany (Bruno Hildebrand, Karl Knies, Wilhelm Roscher, and Gustav Schmoller) pursued a middle course between an empirical approach, seeking generalizations of economic behavior and development, reminiscent of positivism, and an intense regard for the particular historical setting of culture and society in which economic behavior occurred, which reflected historicist principles. The late nineteenth century and the turn to the twentieth century witnessed profound reexaminations of the historical outlook that had been dominant until then. On the one hand, there was a continued, even a heightened faith in science, technology, and the progress of Western civilization that largely survived the trauma of World War I. On the other hand, there was an increasing sense of discomfort with the quality of modern civilization. Darwinism, or rather Social Darwinism, played a fundamental role in both these outlooks. The world was seen as a struggle for the survival of the fittest that could forecast the progressive victory of the white races over the rest of the world, which for Oswald Spengler was a desperate struggle for survival. At the turn to the twentieth century, some Europeans and Americans foresaw progress in terms of growing tolerance and democracy, while others preached racism and ultranationalism. As far as historical thought was concerned, both Burckhardt and Friedrich Nietzsche voiced their discomfort with a modern industrial society with its concomitant social and cultural aspects, a mass civilization moving to commercialism and democracy, and extended this dismay to a critique of the modern faith in science. Nietzsche, Wilhelm Dilthey, Henri Bergson, and Georges Sorel in differing ways called for a restoration of the vital against the mechanical aspects of life and culture. Established patterns of historical scholarship, as practiced by the historical profession, were called into question simultaneously at the end of the nineteenth century from Russia and Poland to North America. Generally, however, the critics of the historical profession did not criticize the latter not because it was too scientific but rather because it was insufficiently so and had not taken into consideration the tremendous changes in modern society and civilization in an industrial and democratic age.

The most spectacular confrontation with the established profession occurred in Germany with the so-called *Methodenstreit*, occasioned by the publication of the first volume of Karl Lamprecht's *Deutsche Geschichte* in 1891. Lamprecht criticized his colleagues for their narrow focus on the state and their neglect of broader cultural and social aspects of history. He also accused them of working with an outdated concept of science and historical science that restricted itself to events and personalities rather than taking into consideration the structural context of historical change. The German professoriate, reflecting the peculiar semiautocratic character of the Prussian German state, vociferously rejected Lamprecht's initiative and saw in it a threat to the established social and political order. Lamprecht's attempt to formulate laws of historical development was rejected internationally, but his call for a broadening of historical perspective to encompass society, economics, and culture was generally welcomed outside of Germany. Historians in Russia (Paul Vinogradoff, Vasiliev Kliuchevskii, and Paul Miljukov), Romania (Nikolae Iorga), Poland (Jan Bujak and Franticzek Rutkowski), Norway (Halvdan Koht), Belgium (Henri Pirenne), as well as the circle around the journal *Revue de synthèse historique* founded by the philosopher Henri Berr in 1900 as a forum for international discussion, and the American 'New Historians' (F. J. Turner, J. H. Robinson, Charles Beard, Carl Becker, H. E. Barnes) called for an expansion of the scope of history and a closer cooperation with the empirical social sciences. Two variations of a social science approach to history need to be mentioned. The first is Max Weber's historical sociology that moves between the historistic emphasis on the recognition of the uniqueness of cultures and a historical social science working with clearly defined concepts and a rigorous logic of inquiry. Weber's conception of social causation and historical development was in some ways indebted to Marx, but unlike Marx emphasized the

interrelation between culture, including religion, and economics, and placed much greater weight on contingency. Weber recognized that societies constituted meaningful relationships that required an interpretive sociology but avoided the sharp distinction that idealistic philosophers such as Wilhelm Windelband, Heinrich Rickert, and Wilhelm Dilthey made between the generalizing natural sciences and the cultural sciences (*Geisteswissenschaften*) that favored empathetic understanding (*Verstehen*).

A second approach to a history taking into account the social sciences was offered by the so-called *Annales* School. It is difficult to reduce the *Annales* to a common denominator. The journal by this name, launched in France in 1929 by Lucien Febvre and Marc Bloch with the support of Henri Pirenne, continued initiatives begun early in the century in Henri Berr's already mentioned *Revue de synthèse historique*. A similar project was initiated in Poland in the journal *Roczniki Dziejow Spolecznych i Gospodarczych*, the editors of which, Rutkowski and Bujak, were in close contact with the *Annales*. In the place of the concentration of the established historiography on events and great personalities, the *Annales* explored impersonal forces and structures.

The 'human geography' of Paul Vidal de la Blache played an important role in the early works of Lucien Febvre and Marc Bloch. Human history had to be understood in the concrete context of space and time. Unlike the German Friedrich Ratzel, who saw soil and race (*Volk*) as determining factors in history, Vidal de la Blache, like Febvre, Bloch, and later Fernand Braudel, recognized the role that human agency and culture played in the formation of the geographic setting. The historians of the *Annales* attempted to pursue a 'total history,' generally limited to a restricted region, in which all aspects, geographic, economic, political, religious, and demographic, were to be included. Quite consciously the dividing line between the established disciplines were overcome, and in the *Maison des Sciences de l'Homme*, opened in Paris in 1968, economists, sociologists, anthropologists, linguists, psychoanalysts, and literary critics were housed with history as the integrating science.

In other ways too, the *Annales* represented a radical break with older historical conceptions. The nation no longer represented the basic unit of history; it was replaced by the region or by a broad comparative approach that extended beyond Europe (Braudel and Pierre Vilar). The concept of a linear time, so basic to all forms of nineteenth century historical thought, and with it the idea of progress, were abandoned, and a historical epoch viewed in its own terms, not as part of a historical process. Burckhardt had already done something similar in 1860 in *Die Kultur der Renaissance in Italien* and had worked with a very broad concept of culture, as had also Jan Huizinga in *Herfsttij der Middeleuwen* (1919), but unlike the *Annales* historians they focused heavily on elites. In contrast the *Annales* dealt with the population at large, but ran the danger that at times their history became impersonal and void of concrete human beings. In retrospect, the racist historiography of German National Socialism of the period 1933–45, although it built on widespread Social Darwinist ideas and ultranationalism, remained an interlude, which even in Germany had limited influence. The Marxism–Leninism of the Soviet Union and its dependent states in its dogmatic forms, in many ways a perversion of Marxism, similarly represents an interlude. As early as 1956, historians in Poland and Hungary, and until the freeze after the Soviet occupation in Czechoslovakia, and even in the Soviet Union (Aaron Gurevich), participated in the broader historical discussions of the international community.

New Orientations after 1945: The Turn to a Cultural Dimension

A subsequent article, 'Historiography and Historical Thought: Current Trends,' will deal with trends in historical thought and study in the second half of the twentieth century. The victory of the Allies in World War II and the dominance of the United States in the postwar world revived older beliefs in progress and science. The 1950s and 1960s witnessed a turn to the quantitative social sciences in historical studies. The years since the late 1960s have seen a reorientation in historical outlook in the Western world generally, including to a lesser extent also Eastern Europe and Russia. The conflicts of the 1960s, the racial confrontation in the United States, the Vietnam War, the student revolts throughout Europe and North America, and the suppression of the Prague Spring all contributed to a change in outlook as did the fundamental technological changes that resulted in the transformation of an industrial society concentrated on production into an economy based on information technology, in which consumption and services play a key role and the old socioeconomic classes gave way to new ones. The confidence in science and economic growth was severely tested as a new generation became increasingly conscious of ecological concerns and called for the emancipation of subordinated segments of the population such as women and ethnic minorities at home and the peoples of the former colonies abroad. The very quality of the modern Western world, including its science, came under attack. All this had consequences for historical studies after the 1960s.

Historical Thought and Historiography: South Asia

T Raychaudhuri, Oxford, UK

© 2015 Elsevier Ltd. All rights reserved.
This article is reproduced from the previous edition, volume 10, pp. 6804–6808, © 2001, Elsevier Ltd., with revisions made by the Editor.

Abstract

This article traces the main features of the South Asian historiographical tradition from ancient times to recent developments. It identifies the central concerns of ancient and medieval Indian historiography – their emphasis on dynastic and political history, and moves on to discuss in some detail the trends in historical writings in more recent times, especially since the World War II. It takes into account both the work of South Asian historians and the international scholarship on the history of South Asia. The impact of decolonization and the social sciences on the historiography of the region is emphasized.

This article addresses two interlinked subject matters, the history of South Asia to which scholars from all over the world have contributed, and historiographical developments in the region of South Asia itself. It briefly covers the historical tradition in premodern times and primarily focuses on developments since World War II.

Historiography of Ancient India

Historical Traditions in Ancient India

Compared to classical Europe, ancient India was rather deficient in historical traditions. The Hindu mythological texts called the *Puranas* (circa first to fourteenth century) contained genealogical lists of Indian dynasties. These lists, by way of narrating the achievements of the kings, also recorded rudimentary information about wars, conquests, and the rise and fall of empires. A very small number of works chronicle the history of individual kings and dynasties. Of these, the most famous is Kalhana's *Rajatarangini* (Stein, 1900), a history of the Kashmir princes. Incidentally, the author recognized one historical principle, namely, that the historian must try to be unbiased in his/her judgment, 'like a judge.'

The Buddhists and Jains developed a tradition of sacred history, especially hagiographies centered on the life stories of their founders. Some of the stories concerning the Buddha, like the account of his death (*Mahaparinivvana-sutta*, Bongard-Levin, 1986) bear the stamp of authenticity.

European Scholarship on Ancient India

In the nineteenth century, European scholars like Pargiter tried to reconstruct the dynastic history of ancient India using the Puranic lists, inscriptions, coins, archaeological remains, and foreign accounts of India like those of Alexander's historians and the Chinese Buddhist pilgrims. European Orientalists also tried to reconstruct the religious and social history of India, using religious texts and the *smritis*, normative writings laying down the rules by which the Brahminical Hindu was expected to live in matters, both ritualistic and secular (like inheritance and punishment for crimes). They also undertook the massive task of publishing critical editions of religious texts that laid the foundation for serious work on religious, cultural, and social history. A large number of German, French, and East European scholars have contributed to this enterprise.

Historiography of Ancient India: the Indian Contribution

A large body of Indian scholars started research on ancient Indian history following the lead of the European scholars. Their work was heavily focused on archaeological evidence, especially the study of inscriptions. The archaeological work, by Europeans and Indians, helped move back the known beginning of civilization in South Asia to about 3000 BC through the discovery of the Indus Valley Civilization. The work of the Indian Indologists also reflected the newfound nationalistic pride in the glories of ancient India. Some of it focused on traditions of democratic/oligarchic politics and developed statecraft to challenge the notion that these were European imports into India. However, the central concern of the earlier work was with the meticulous reconstruction of dynastic history, especially the correct chronology. Some scholars like R.K. Mukherji and R.C. Majumdar did research on the history of Indian cultural influence in Southeast Asia and invented the now discarded notion of Greater India.

'Orientalism': A Controversy

Edward Said's *Orientalism* (1995), which projects the view that Western scholarship on Asia projected the notion of an inferior 'other' of Europe and thus reflected the new relationships of power generated by imperialism, has had a seminal influence on the historical work on South Asia (since 1980) even though Said's primary point of reference was the Middle East. The controversy generated by this work has drawn attention to the many strands of Orientalist studies in the West and to the fact that French and German studies of South Asia do not project any unquestioned superiority. For ancient India, the controversy has led to more research on Western historiography than to any reorientation in the exploration of substantive themes.

Indology after World War II

The post-World War II historiography of ancient India has moved away from these earlier preoccupations and, under the influence of Marxism as well as anthropology, concerned itself

with discovering structures like feudalism and patterns of large-scale social change over time. The writings of Kasambi (1965), Sharma (1965), Romila Thapar et al. (1990) are prime examples of this initiative. The multivolume *History and Culture of the Indian People* edited by Majumdar (1951–1969) reflects a more traditional approach, while Louis Dumont's *Homo Hierarchicus* (1972) applies Levi-Strauss' structural analysis to the study of the caste system.

Historiography of the Indo-Islamic Period

The thirteenth century saw Turkish and Afghan dynasties and tribes, Muslims by faith, firmly established as rulers in many parts of India. The sultanate based in Delhi, where there was a succession of dynasties, became the seat of a pan-Indian empire with fluctuating boundaries. These dynasties were succeeded by the Mughals or Timurids in the sixteenth century and their effective rule lasted until the late eighteenth century. This long period, marked by the encounter between the older Indian civilization and the religion and culture of Central Asia's Islamic peoples, has been the subject matter of a rich historical literature.

The Medieval Persian Chronicles

India's Central Asian invaders brought with them a rich tradition of historiography. This literature, written mostly in Persian, is known as *tarikhs*, a term, translated as annals. The *tarikhs* are narratives of dynastic successions, wars, and conquests. Some of the writers had leanings toward Islamic fundamentalism and hence were inclined to present the wars of the Muslim invaders and Hindu dynasts as *jihad* or 'holy' wars. These accounts were later used by some British writers to project the Indo-Islamic era as an age of Muslim tyranny. This perception informed the ideology of India's proto-nationalism, which saw the struggle of the Rajput clans and other Hindu chiefs to retain their territories as the Hindu struggle for independence. However, chronicles provide ample evidence of a pragmatic bent in the policies of the Muslim kings, anxious not to alienate their Hindu subjects. The historians at the court of the third Mughal emperor Akbar, project his policy of peace with all, which was not to the liking of the more orthodox elements at his court. One component of the historical literature of the period is the memoirs written by the emperors, Babar and Jahangir, and by Babar's daughter, Gulbadan. These sensitively written accounts offer a portrait of the age and the family life of the Mughals.

Regional Histories

The Indo-Islamic era also produced a rich and varied body of historical writings written in the regional languages. Best known among these are the Marathi *bakhars*, modeled on the Persian *tarikhs*, the chronicles of the Ahom kings of Assam, known as *buranjis*, and the *Madla Panji* retained in Orissan temples which recorded the annals of the local dynasties. Besides these, the Vaishnavas in Bengal produced a body of hagiographical literature celebrating the lives of their founder, Chaitanya and other pioneers of the movement. All these products of the period have been later used to reconstruct the history of the period.

Colonial and Postcolonial Historiography of the Indo-Islamic Era

The earliest 'modern' historical writings on the Indo-Islamic era go back to the nineteenth century. Works such as Orme's *History of Indostan* are amateur efforts focused on the political history of the period. The famous collection of selected source material, translations from the Persian chronicles, Eliot and Dawson's *History of India as Told by Her Own Historians* (1981), contain introductions that are essentially historical statements. One of the compiler's stated objects was to prove how very inferior 'Muslim rule' was compared to its British counterpart. In general histories of India, written by administrators–scholars like Vincent Smith (1981) the same concern to prove the superiority of British rule is less obviously present. It only appears as a view of Indian history that projects a long-term proneness toward political unification that finally succeeds only under the British. Such works contain an implicit evaluation of moral and material welfare of the people in pre-British times. The twentieth-century economic historian W.H. Moreland (1920) undertook a comparison between India at the death of emperor Akbar with conditions in the nineteenth century. Serious academic research on the Indo-Islamic era, based on the study of the chronicles as well as documentary evidence like the *akhbars* or newsletters of the Mughal period, belongs to the twentieth century. It produced magnificent works of scholarship such as Sir Jadunath Sarkar's multivolume histories of Aurangzeb and the later Mughals focused on political narratives. There were other studies dealing with the religious policies of the Mughals and art and architecture of the period. The burgeoning nationalist consciousness sought to emphasize the syncretist traditions of the Indo-Islamic era, implying that the conflict between communities was a product of British rule.

Since World War II, a major development in this field of study resulted from the work of a group of scholars based at Aligarh. Irfan Habib's *Agrarian System of Mughal India* (2000), drawing upon a wide range of source material, was hailed as a pathbreaking contribution to the study of agrarian history. The research of the Aligarh 'school' uses the methods of modern historiography and has drawn upon a vast quantity of new material. While some of the scholars subscribe to Marxist theories of history, the impact of Marxism is not very obvious in their work.

In recent years some Western historians have projected the view that the Mughal Empire, like all its predecessors in India, was a 'segmentary state' under a thin veneer of centralization. This has led to a controversy with some of the Aligarh historians.

Historiography of the Colonial Era

Colonial Historiography under Colonial Rule

British historian's writing in the colonial era produced a large body of works that recorded the history of the conquest, the

wars with indigenous powers, and histories of the local powers like the Marathas, Sikhs, and Mysore with whom they had to contend for power. These histories are in the purely narrative mode, supplemented by ethnographic accounts of various elements in Indian society. They are informed by a simple assumption regarding the legitimacy and naturalness of the British conquest. One of the pioneers in the field, James Mill (Mill and Wilson, 1997), writing in the early decades of the nineteenth century, first projected a clear notion of cultural and racial superiority, significantly absent from earlier British writings on India.

British writings in the latter half of the nineteenth and early decades of the twentieth century often assumed a defensive posture in response to the growing nationalist criticism of their rule, especially the charge that the colonial nexus had induced a drainage of resources from India, thus steadily impoverishing the country. British historians challenged this view and instead projected a picture of economic transformation and development as a result of colonial rule. This controversy has not yet died out. The British historiography of colonial rule before World War II almost entirely focused on the activities of the government. A number of studies dealt with individual viceroys. Some twentieth-century works briefly refer to the burgeoning nationalist movement (one historian described it under the heading 'Political Sentiment') but with one exception they dismissed it as a phenomenon not to be taken seriously until the very eve of the transfer of power. However, the British colonial historiography increasingly adopted the methods of modern research with its emphasis on 'objective' analysis of records. But since the records in question were for the most part products of the colonial government, the resulting research inevitably reflected the built-in bias of the documents, a bias that the historian generally shared. Indian historians, excepting those writing on economic history, rarely ventured into comments on the history of British rule. Exceptions to this pattern were the publicists writing on the rising of 1857 (one of whom described it as India's First War of Independence) and authors who considered British rule to be beneficial for India. The strong ideological and political undertone manifest in the historiography of the colonial era has assumed more subtle forms in the postcolonial period.

Historiography of Modern India after Decolonization

Since the transfer of power in 1947, attention has shifted from the working of the British administration to the structure and dynamics of indigenous politics, though a number of monographs on the political history of the Raj, as well as its administrative and constitutional initiatives, were written during this period. Indian historians now came to be deeply concerned with the history of the Indian nationalist movement and its social–cultural origins. A group of historians approached the subject from the overt perspective of nationalism; others were influenced by Marxist class analysis and saw Indian nationalism as an expression of colonial bourgeois aspirations. A group of British historians centered at Cambridge explored the close relationship between British administrative and colonial initiatives on the one hand, and the structure and dynamics of indigenous politics on the other. The competition between those who were admitted to a share in power by the colonial ruler and those who were not was seen to be the central feature of indigenous politics. Nationalism itself was perceived to be a strategy reflecting the aspirations of the 'have-nots.' This view was questioned by Indian historians who saw the thesis as a continuation of the old colonialist perception dismissing nationalism as a conspiracy of the self-seeking few. However, the thesis was directly, or indirectly, questioned outside India as well. A group of historians under the leadership of Professor Low of the Australian National University recognized the reality of Indian nationalism and proceeded to unravel its local and class roots. American scholars brought to the subject the insights of social sciences, especially sociology and anthropology. There were considerable developments in economic history, using economic theory as well as statistical methods. The new techniques were used to tackle the old questions regarding the negative or positive impact of colonialism. The debate, as noted, remains inconclusive. The inadequacy of statistical evidence is one reason for this state. It should be noted here that Indian historical research has now become an international enterprise to which the Japanese, Russian, and continental scholars have made significant contributions.

One major new development in the subject is centered on the series of publications entitled *Subaltern Studies* (Guha et al., 1988). Borrowing the concept of the Subaltern from the Italian Marxist, Gramsci, the contributors to this series have focused on the history of the underprivileged elements in South Asian society and used the postmodernist techniques of discourse analysis to unravel the autonomous consciousness of the dispossessed and the record of their resistance to exploitation and domination by the elite. This movement, too, has become an international enterprise with historians and social scientists from all parts of the Anglophone world contributing to the *Subaltern Studies*.

Pakistani historians and their preindependence predecessors who focused on the development of Muslim consciousness and aspirations in the subcontinent have been deeply influenced by the theory of two nations, the ideological basis of the demand for Pakistan. Their perception is in sharp contrast to the nationalist perception of coexistence and mutual accommodation between the major ethnic cultures of the region. The history of Sri Lanka, despite its many links with the civilization and society of the mainland, has been unjustifiably peripheral to the concerns of the historians of India. But there was a strong tradition of historiography in the region drawing, inter alia, on the Buddhist religious texts for the ancient period. Some of the products of this historiography are influenced by Marxist theories of history.

One marked feature of developments in the historiography of modern India is the diversification of its subject matter. History of art and its links with nationalist sentiment, women's studies, and ecological history are some of the areas explored in recent years. This has helped bring the subject within the sphere of contemporary intellectual interest and brings to an end its intellectual isolation.

Historical Thought and Historiography: Southeast Asia

Anthony Reid, Australian National University, Canberra, ACT, Australia

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Southeast Asian literary traditions, extant from the fifteenth and sixteenth centuries, included Chinese-style dynastic histories, narratives of Buddhist sacred sites, and royal chronicles influenced by both Buddhist and Islamic patterns. More modern types of religious and secular narratives developed by the late eighteenth and early nineteenth centuries. For some of these, we can trace the external stimuli, but others appear to have developed autonomously. These traditions were overwhelmed in the late nineteenth and early twentieth centuries by Western narratives taught in colonial schools, often of a triumphalist imperial kind. These were adapted for their own purposes by Marxist and nationalist writers intent on change. Initially ignorant, embarrassed, or romantic about the older indigenous writing, Southeast Asia's new national historians rediscovered the great diversity of these traditions as they became professionalized with the development of university systems. International historians writing in English remain influential in these professional circles, particularly in the growing fields of social, intellectual, economic, and environmental history and transnational trends across the region. Controversies continue to swirl around the definition of the nation, violent traumas such as 1965–66 in Indonesia and 1975–78 in Cambodia, and the monarchy in Thailand.

Embracing the southeastern peninsula of Eurasia and the Indonesian and Philippine archipelagoes, Southeast Asia has recorded its history in a dozen written languages and countless oral traditions. Indic models of writing were influential in the millennium before CE 1200, and Chinese and Islamic ones in the subsequent six centuries, while European enlightenment interpretations of history became increasingly dominant in the nineteenth and twentieth centuries. Diversity has always been a hallmark of this region. The Vietnamese emulated the Chinese literary tradition with their dynastic chronicles; cyclical Indic ideas had a longer career in the Theravada Buddhist societies of the mainland, while linear Muslim and Christian ideas became influential in the islands. Nevertheless, synchronicities are apparent in the developments within seemingly autonomous literary and historiographic traditions.

Oral poetry and traditions were important for most peoples, but particularly for those in the highlands and eastern islands (including the Philippines), which did not absorb Indic or Chinese literary forms. As late as the 1960s, at least one people in Roti (near Timor) retained oral historical narratives that accurately recorded the names of chiefs for three or four centuries. Most of the written chronicles that took shape in the sixteenth and seventeenth centuries incorporated older traditions with the repetitive features of oral narrative.

Chronicle Traditions

The dynastic chronicles of Dai Viet were expressed in Chinese and followed the model of didactic Chinese chronicles heavily informed by the moral perspective of Tang and Sung Confucianism. Some such work survives from the fourteenth century, but the most important is the strictly Confucian chronicle composed by Ngo Si Lien in 1479. This in turn incorporates the *Dai Viet su ky* of Le Van Huu (1272), which included a historical justification for the independent imperial status of Dai Viet – then occupying little more than the Red River delta.

The remaining written traditions grew out of Indic models in Sanskrit and Pali, or in the Malay case from Islamic writing in Arabic and Persian. Sacred histories, in Mon (the then language of what is today southern Burma), Burmese, Thai, and Khmer, as well as in Pali, traced the establishment of Buddhist law and practice from the time of the Buddha to the founding of local temples in Southeast Asia. Among the earliest examples are the northern Thai *Mulasasana* (around 1420) and the Pali *Jinakalamalipakaranam* (1516), both written by monks in Chiang Mai.

Royal and dynastic chronicles are almost old. The *Pararaton*, a unique chronicle in old Javanese of the Javanese kingdoms of Singosari and Majapahit down to 1481, was written after the fall of Majapahit to Muslim forces around 1527. The earliest extant *yazawin* (royal genealogy or chronicle) in Burmese was written by the monk Shin Thiawuntha in 1520. Dynastic chronicles (*phongsawadan*) were being compiled in Thai from at least the sixteenth century, although the Luang Prasoet text conventionally dated 1680 is the oldest of the extant versions that have come down to posterity. Written by an astrologer at the cosmopolitan court of King Narai (1657–88), this chronicle marks a trend to more secular dynastic history well aware of Siam's position among its neighbors as well as European, Indian, and Chinese visitors.

The advent of Islam created more discontinuities in the south than Theravada Buddhism did in the north. As Southeast Asian Islam shifted from an Arabic to indigenous idiom in the fifteenth and sixteenth centuries, the Malay language written in Arabic script became its favored vehicle. Only in Java and South Sulawesi, and of course in non-Muslim Bali, did the older literary idiom and alphabet continue alongside the Arabic/Malay one. Probably the oldest extant Malay chronicle is that of the Kings of Pasai, in north Sumatra, which became the first substantial Islamic state in Southeast Asia in the 1290s. This *Hikayat Raja-raja Pasai* may have been first compiled by Pasai Malay captives in Java in the late fourteenth century and represents a collection of semimythical stories about the Pasai kings, much more reflective of local oral traditions than of mainstream Islamic historiography. Other Malay royally

focused chronicles of the sixteenth or seventeenth centuries take this storytelling mode to an art form that can be illuminating for the historian even when devoid of chronology. The *Hikayat Banjar*, for example, tells origin stories about the leading Islamic state in southern Borneo through a conservative ethic extolling the virtues of a Javanese cultural model.

Most reprinted today is the Genealog of (Melaka) Kings (*Sulalat'us-Salatin*), a version of which Thomas Stamford Raffles printed and popularized in 1821 under the name The Malay Annals (*Sejarah Melayu*), in a conscious attempt to provide a national history for Malays. It weaves through a host of lively anecdotes its political message that the great metropolis of Melaka fell to the Portuguese in 1511 because the fundamental contract between the ruler and the ruled was violated by the last Melaka ruler. Originating in some form a generation after this Malay disaster, the text appears to have been essentially created in the early seventeenth century by the Johor writer Tun Seri Lanang, although subsequently much modified. Not much later, but a great deal more Islamic in spirit, was the encyclopedic Garden of Kings (*Bustan as-Salatin*), written by the Gujarat (India)-born theologian Nuruddin Ar-Raniri around 1640. Written in Malay at the behest of the Sultan of Aceh, in northern Sumatra, this includes a substantial chapter on the history of Aceh, and another on Melaka, and represents the most skillful use in Malay of Islamic traditions of historiography.

Java's conversion to Islam was a turbulent and drawn-out process centered in the fifteenth and sixteenth centuries. The syncretic Islamo-Javanese courts that emerged from it produced a chronicle tradition in Javanese verse known as *babad*, part mythical, part prophetic and instructional, and part genealogy. The central narratives designed to show the legitimacy of the Mataram kings who followed are collectively known as the *Babad Tanah Jawi*. All modern historians, beginning with Raffles (see below), have drawn on this set of traditions, although the task of editing a canonical text has so far defeated modern scholarship. The most chronologically accurate of the early Javanese histories, the Kartasura verse chronicle *Babad Ing Sangkala*, was written in 1738 but thought to incorporate a relatively accurate text originally compiled before 1670.

An Autonomous Modernity?

There are interesting harbingers of a more modern linear concept of historical writing before the encounter with European models in the nineteenth century. In South Sulawesi (Celebes), an Indic-derived alphabet was only introduced for the Makasar and Bugis languages (probably from Sumatra, where it had not been used for chronicles) in the fifteenth century. It appears to have been adopted especially for the recording of aristocratic genealogies, essential for asserting supernatural origins and establishing appropriate marriage partners. From around 1600, such genealogies were transformed into state chronicles at Makasar, then a major maritime power influenced by both European and Islamic literary models. Court diaries also began to be written in the 1620s to record royal births, deaths, and marriages, as well as notable foreign visitors, wars, and innovations. These state histories adopt a critical tone toward their sources, a distinctly linear notion of the progress of the kingdom through various innovations, and a desire to learn from failures as well as successes. The Goa (Makasar) chronicle began with an explanation of why it was important that future generations remember the past, 'to avoid the twin dangers, either of our thinking that we were all great kings, or of others alleging that we were worthless.'

The late eighteenth century witnessed more abundant historical writing in a self-conscious, secular, and linear pattern in several Southeast Asian traditions. While the better survival of manuscripts written after the wars of the eighteenth century may be one explanation, there also appears to have been a creative sense of crisis and new beginning that prompted reflection on the past. An early sign of this trend was U Kala's *Great Chronicle of Kings* (*Mahazawingyi*), the first comprehensive and chronologically reliable Burmese chronicle, written in the 1720s. In the late eighteenth century this was incorporated into the first history that might be called national, the "New Chronicle of Myanma" (*Myanma Yazawinthit*), also the first to use its sources in a critical sense.

Among Vietnamese, the new trend was embodied by the scholar-official Le Quy Don (*c.*1726–84), who wrote both a Le Dynasty history in biographical form – *Dai Viet Thong Su* The Complete History of Dai Viet – and the encyclopedic *Phu Bien Tap Luc* (*Miscellaneous Records of Pacification in the Border Area*). The latter addressed technological, economic, cultural, and political developments in the southern Vietnamese kingdom (known to foreigners as Cochinchina), which was a rival of his own. The Thai-language kingdoms endured a mauling from Burma in the late eighteenth century, and virtually all responded in the period 1790–1830 by carefully reconstructing their histories to draw moral lessons from disaster and to establish the legitimacy of new lineages. In Java for a similar reason, there was a spate of chronicle writing after a long period of warfare that ended with the peace of Gianti in 1755.

European Enlightenment Influences

The Philippines was the area best endowed with early European writings because of the prominence in the colonization of the islands of Spanish religious orders, each of which produced chronicles. Among the best of these, containing much material about the pre-Hispanic Philippines, were those of the Franciscan Marcelo de Ribadneyra (1601), the Jesuit Pedro Quirino (1604), and the Dominican Diego Aduarte (1640). An outstanding later example of the genre was the 14-volume chronicle of Spanish and missionary activity in the islands by the Recollect Juan de la Concepcion (1788–92). As nineteenth century Spanish accounts became ever more negative about the achievements of the Filipinos, the first generation of nationalists turned for inspiration to an outstanding Spanish secular writer, Antonio de Morga, whose *Sucesos de las Islas Filipinas* (1609) received its first modern edition (1868) in English rather than Spanish. The intellectual pioneer of Philippine nationalism, Jose Rizal (1861–96), published in Paris a new Spanish edition of the work in 1890, with the professed intention "to awaken your [Filipino] consciousness of our past, already effaced from your memory, and to rectify what has been falsified and slandered."

European writer-officials such as de Morga sometimes incorporated translations of local chronicles into their texts, even if increasingly skeptical about their mythic and didactic purposes. The earliest version of the Thai royal chronicle was that acquired and translated by the Dutch factor Jeremias van Vliet in 1640, with unacknowledged help from his well-connected local wife. More influential on European enlightenment ideas, however, was the elegant description of Siam in the 1680s by an envoy of King Louis XIV, Simon de la Loubère. A number of other Dutch, French, and English accounts of seventeenth-century Southeast Asia were influential for the expanding European understanding of the world, and many remain useful sources today. Empirically, the most ambitious such work was the encyclopedic *Oud en Nieuw Oost-Indiën* (8 volumes, 1724–26) of Francois Valentijn, who compiled it in retirement in Dordrecht after serving for 16 years as a Dutch Reformed Pastor in Ambon and Java.

The nineteenth century began with a number of scholar-officials participating self-consciously both in enlightenment ideas about history and progress, and in Britain's rediscovery of Southeast Asia. William Marsden (1754–1836), later Vice-President of the Royal Society, was a pioneer with his *History of Sumatra* (1783). As governor of Java during the British wartime interregnum (1811–16), Stamford Raffles (1781–1826) was able to command both more resources and more influence with his *History of Java* (2 volumes, 1817). He popularized the romantic ruins of vanished kingdoms in Java and elsewhere and the notion that modern Southeast Asians were in a state of decline from their 'classic' age, which could only be reversed by enlightened British rule. The Edinburgh-trained doctor John Crawfurd (1783–1868) deserves particular attention as an historian and encyclopedist of Southeast Asia as a whole. His *History of the Indian Archipelago* (3 volumes, 1820), followed by the *Descriptive Dictionary of the Indian Islands and Adjacent Countries* (1856), covered almost the whole region, based on first-hand knowledge of Java and Singapore as an administrator, and the official missions he led to Burma, Siam, and Viet Nam in the 1820s, each of which yielded published reports that began the rendering into English of the chronicle traditions of these countries.

Writers in Malay were the first to respond to this new European scholarship, notably those who cooperated in the quest for manuscripts by English and Dutch officials. Munshi Abdullah bin Abdul-Kadir (1797–1854) was a Malay writer for Stamford Raffles and his successors in Singapore, and used his understanding of British mores to launch a critique of the Malay society of the sultanates. In his vivid autobiographical works, *Kisah Pelayaran Abdullah ke Kelantan* (*The Story of Abdullah's Voyage to Kelantan*, 1838) and *Hikayat Abdullah* (1849), he introduced such concepts as progress, race, freedom, and the rule of law into Malay historical writing. South of Singapore, the Riau court writer Raja Ali Haji (*c.*1809–70) was in regular contact with the Dutch Malay scholars of his day and learned something of their perspective on history. The spirit of his two outstanding histories, *Silsilah Melayu dan Bugis dan sekalian raja-raja-nya* (*Genealogy of Malay and Bugis Princes*, 1865) and *Tuhfat al-Nafis* (*The Precious Gift*, around 1866), is nevertheless heavily didactic in the best Islamic tradition.

As Southeast Asia became partitioned among the colonial powers in the second half of the nineteenth century, the more talented colonial officials pioneered modern-style 'national' histories in English, French, and Dutch. These usually combined some of the chronicle record of ancient kingdoms, the interventions of foreigners, and the rise of colonial power within the borders later marked out by European treaties. Sir Arthur Phayre, an army officer who spent the years 1835–67 in key posts in Burma, was the first of these with his *History of Burma* (1883), followed in 1926 by a book of the same name by G. E. Harvey. Adhémard Leclère wrote a *Histoire du Cambodge* in 1914, sometime before the more demanding equivalent for Viet Nam, *Histoire Moderne du Pays d'Annam (1592–1820)* (1920), by Charles Maybon. A history of Siam was first published in French on the basis of missionary accounts by Turpin in 1771, but the first of the modern European histories was that of the British Consul in Chiang Mai, W. A. R. Wood (1926), relying much on the chronicles. The Netherlands-Indian school system, like those of colonial Viet Nam and Burma, required 'national' textbooks in the colonial language and idiom, of which the most influential was the Dutch-triumphalist *Geschiedenis van Nederlandsch Indië* (1930) of F. W. Stapel. In Malaya, however, there was a deliberate distinction between a colonially centered history of the place in English and a dynastic chronicle-centered story of the Malay people in Malay, the latter based on Sir Richard Winstedt's *Tawarikh Melayu* ('Malay History,' 1918).

Although such writings were influential in creating the sense of a national identity (albeit colonially dominated), it was European archeology that excited the imagination of both Southeast Asians and outsiders. Raffles had brought the great monuments of Borobudur and Prambanan to world attention, and later in the century, Dutch scholars began systematic work to document them. The ruins of Angkor became known to Europeans in the 1860s, which began a romantic quest for ancient civilizations. The modern restoration of the ruins of Angkor began under French auspices in 1907, while the Dutch and English were not far behind in restoring the monuments of Java and Burma, respectively. The inscriptions of these and other temples allowed the histories of the temple-building Hindu–Buddhist kingdoms to be reconstructed, through the work of Louis Finot and George Coedès in Cambodia, N. J. Krom and W. F. Stutterheim in Java, and the 'Greater India' school led by R. C. Majumdar in Calcutta. In Java and Cambodia in particular, the fascination with these grand but mysterious pre-1400 kingdoms was a more powerful spur to nationalism than were the later kingdoms that seemingly either collaborated or failed in the collision with European power.

Nationalist and Marxist History

All of Southeast Asia except Siam/Thailand was under Western colonial control from 1900 to 1941 and was ruled by the Japanese for nearly four turbulent years (1942–45) thereafter. The sudden Japanese surrender in August 1945 inaugurated a period of revolutionary struggles in the successor states, with relative peace imposed on Indonesia only around 1966, Viet Nam after 1975, and Cambodia in the 1990s. The first half of the twentieth century was a period of extraordinary debate and rethinking of the meaning of history, as a Western-educated generation increasingly detached from cultural connections to

the immediate past developed new ways of reinterpreting the new Western narratives for modernizing purposes. First Social Darwinism and then Marxism were seized upon as means to explain what had to be done to save the nation from colonial humiliation. By the 1950s, a nationalist, anticolonial historiography was dominant everywhere except Malaya/Malaysia and Thailand, turning militant opponents of the colonial order into the most exemplary heroes. Marxist categories were selectively adopted but were influentially used everywhere to devalue the precolonial past as generically 'feudal.' Debates remained intense between communist, religious, and ethnonationalist readings, and often between local and national perspectives.

In Indonesia, nationalist writers suddenly occupied center stage when the Japanese occupation removed all Dutch textbooks. Muhammad Yamin (1903–62), a Sumatran convert to a Java-centric view of national history, became the most influential writer and patron of a nationalist history that glorified Sriwijaya and Majapahit as precursors of modern Indonesia. His works on the fourteenth-century Javanese kingdom of Majapahit, *Gajah Mada* (1945) and *Tatanegara Majapahit* (3 volumes, 1962), have long-term significance.

In Thailand, a similarly influential figure through the most nationalist phase was Wichit Wathakan (1898–1962), a commoner who became an immensely popular writer of historical novels and plays, as well as a 12-volume world history (1931). After the antimonarchy revolution of 1932, he replaced Prince Damrong Rajanubhab (1862–1943) as the government's arbiter of culture and history. Where Damrong had chronicled a Thai identity developed from the monarchy's gradual adoption of liberal modern values, Wichit glorified the purity and heroism of the Thai race.

In Viet Nam, the debate between traditionalists, nationalists, and Marxists centered on the evaluation of the Nguyen dynasty, which unified the country with some French assistance in 1802, and of the Tay Son rebellion, which preceded it in the late eighteenth century. Tran Trong Kim (1883–1945), author of the first modern Vietnamese history (1928, constantly reprinted until the 1960s) and briefly Prime Minister under the Japanese, broke with the dynastic chroniclers in accepting the Tay Son leader Quang Trung as a national hero. Nevertheless he accepted the first Nguyen emperor Gia Long, who defeated Quang Trung's forces, as a dynastic founder and unifier. Dao Duy Anh's *Short History of Vietnamese Culture* (1938) was the first and perhaps the best of the Marxist-influenced studies that saw Vietnamese culture as constantly evolving through social forces. For later Marxists, the Tay Son were heroic peasant rebels, while the last dynasty was a disaster because it failed to adapt to historical conditions.

The nationalist format remained dominant within Southeast Asia into the 1970s, and was given international currency by the Indo-China conflicts. The Viet Nam war stimulated some fine research and writing in English and French seeking the key to Viet Nam's resistance to US intervention in a long tradition of anti-Chinese and anti-French patriotism. John McAlister's *Viet Nam: The Origins of Revolution* (1969), David Marr's *Vietnamese Anti-Colonialism 1885–1925* (1971), and Frances Fitzgerald's *Fire in the Lake: The Vietnamese and the Americans in Vietnam* (1972) were all influential at the height of the conflict. These helped to stimulate a strong generation of US students entering the field of Southeast Asian history in the 1970s, even though few could find academic positions in their own country in the 1980s.

Traditional monarchies were forcibly rejected by the nationalist revolutions in both Indo-China and Indonesia, both because they were deemed to have been artificially sustained by colonialism, and because they did not fit with revolutionary aspirations for the new egalitarian man. The historians also took a very critical view of nineteenth century monarchs who had failed to resist the Europeans. Some Marxists shared Tan Malaka's view that Indonesia had no history worth writing about "except one of slavery." Nationalists, however, typically reached further back into a mistier past, when conquering kings were uncritically celebrated as a boost to national self-confidence. Only the Thai (very narrowly) and Malay monarchies survived the revolutionary era of the 1940s. The establishment version of Thai nationalist history constructed by King Vajiravudh and Prince Damrong in the first two decades of the past century was shaken by the military revolution of 1932 and almost forgotten amid the strident nationalism of the 1940s, but reestablished itself thereafter in the long reign of King Bhumibol (1950–present). It stressed the unique virtues of Thai monarchy in preserving Thailand's independence and fashioning a flexible modernity. The contestation of this increasingly rigid format by professional and international historians (led by Thongchai Winichakul) became since the 1990s the dominant controversy of Thai history.

Postnationalist, Regional, and Thematic Histories and Debates

The 1970s and 1980s witnessed a number of Cold War authoritarian regimes, which imposed their narrow versions of the nationalist (or in Indochina Marxist-nationalist) historiography in schools and universities. This provoked a reaction toward more critical studies, distrustful of meta-narratives especially when they served state interests. Professional historians who had served the dictators, such as Professor Nugroho Notosusanto who became education minister under General Suharto's long presidency (1966–98) of Indonesia, tended to be discredited when their patrons fell from power. The many Filipino historians who were generously funded to write the multivolume *Tadhana: The History of the Filipino People* (1976–80) were fortunate that only President Ferdinand Marcos' name appeared on the books, which were scarcely mentioned after the Dictator's overthrow in 1986.

The heaviest national imprint on historiography was, however, that of Viet Nam, because questioning that narrative was long equated with supporting southern separatism or American intervention. Historians of the South Vietnam regime (1954–75), often themselves refugees from the north, did not challenge the grand narrative for suppressing southern identity but rather for leading naturally to communism. It was left to a new Vietnamese-American generation of the children of refugees to begin since 2000 to write sympathetically about losers and victims of the *Nam Tien* (southward movement) of the Vietnamese state – Cham, Khmer, various once-autonomous communities, and local regionalisms. Keith Taylor at

Cornell University was the most prominent Western historian to break the mold, seeming to reject his own pioneering *The Birth of Vietnam* (1983) in a series of dramatic concessions to Indochinese pluralities. The nationalist narrative had downplayed or decried the division of Viet Nam into two warring polities throughout the period 1600–1777, whereas Li Tana's *Nguyen Cochinchina: Southern Vietnam in the Seventeenth and Eighteenth Centuries* (1998) celebrated the southern kingdom's diversities. Among the volumes signaling the new trend were Keith Taylor and John Whitmore, *Essays into Vietnamese Pasts* (1995), and Nhung Tuyet Tran and Anthony Reid, *Viet Nam: Borderless Histories* (2006).

Anglo-Irish Benedict Anderson (*b*.1936) made his career at Cornell University, where his brand of culturally informed political and intellectual history had even more influence on historians than on his own discipline of political science. His pathbreaking *Imagined Communities: Reflections on the Origins and Spread of Nationalism* (1983) was preceded by a series of more specific studies on Javanese and Indonesian political culture through Japanese occupation and revolution. In the 1970s and 1980s, deeply alienated from Suharto's Indonesia, he addressed the political identity of Thailand and the Philippines in a revisionist manner, undercutting the idea of Siam's uncolonized uniqueness. Among the able historians trained at Cornell, Michigan, and elsewhere were a number of Southeast Asians who had an impact in their own countries as well as internationally. Reynaldo Ileto (*b*.1946) pioneered a new kind of history from below by beautifully demonstrating how popular Christianity provided the idiom of resistance in his *Pasyon and Revolution: Popular Movements in the Philippines* (1979).

Nidhi Eoseewong (or Aeusrivongse, *b*.1940) wrote almost entirely in Thai after returning to teach in Chiang Mai, but his admirers eventually ensured a translation in *Pen & Sail: Literature and History in Early Bangkok* (2005). Shifting agency in Thai history away from kings and Westerners to broader socioeconomic changes, he argued that the emergence of a Sino-Thai market economy in the early nineteenth century lay behind a new modern spirit in literature. Thai historiography was also enriched by a generation of (largely Sino-Thai) student leftists in the 1970s, who were either arrested during the military coup of 1976 or escaped to briefly join the communist insurgency, but were eventually able to study overseas. Kasian Tejapira at Cornell sensitively explored the relations between Chineseness, Thainess, communism, and democracy, while Thongchai Winichakul's Sydney thesis, published as *Siam Mapped: A History of the Geo-body of a Nation* (1994), injected into the debate on nationalism the importance of mapping and spatial representation.

Taking the critique of nationalist histories to the furthest extreme was the work of political scientist James Scott (*b*.1936), who wrote in an increasingly historical vein about the everyday resistance of peasant societies. His *The Art of Not Being Governed: An Anarchist History of Upland Southeast Asia* (2009) argued powerfully that the statelessness of many Southeast Asian peoples was a rational preference for freedom rather than a sign of backwardness. The interdisciplinarity of Southeast Asian history was indeed its comparative advantage. Besides Scott and Anderson, the cultural anthropologist Clifford Geertz (1926–2006) was perhaps the most influential Southeast Asianist among historians. History is seldom absent from his studies of Java, Bali, and Islam, but most salient in *Agricultural Involution: The Process of Agricultural Change in Indonesia* (1963) and *Negara: The Theatre State in Nineteenth Century Bali* (1980). The latter influentially argued that elaborate royal rituals were the defining acts of Bali states, not simply their decoration or arcane cosmology.

The construction of a broader Southeast Asian historical identity was primarily the work of Western scholars, although a few early nationalists such as Jose Rizal initially sought a broader regional identity (in his case Malay) as a means to escape from colonial entrapments. Another Asian pioneer of this idea was Nguyen Van Huyen (1908–75), later Education Minister in the Hanoi government. As a student and Vietnamese teacher in Paris he discovered Dutch scholarship on Indonesia, and used it to good effect in his study of common patterns of house building in the region, probably the first academic study of Southeast Asia by a Southeast Asian – *Introduction à l'Etude de l'Habitation sur Pilotis dans l'Asie du Sud-est* (1934).

The term Southeast Asia (*Südostasien*) was first found useful by German-speaking prehistorians like F. Heger and Robert Heine-Geldern who used it from the early 1900s to describe the dispersion of bronze-age Dongson drums throughout the region, and similarities in the Hindu–Buddhist temple art and architecture. Primarily French scholarship on the inscriptions uncovered relations between the ancient kingdoms of Angkor, Champa, Dai Viet, Pagan, and Java. George Coedès (1886–1969) first brought this material together in a pathbreaking book he entitled *Histoire Ancienne des États Hindouisés d'Extrême-Orient* (Hanoi, 1944), although better known in its English translation (1968). Coedès broke with the 'Greater India' school that regarded the Southeast Asian kingdoms as Indian colonies, but continued to see Indian agency through visiting traders and scholars. Later historians such as Paul Mus, Bernard Groslier, Oliver Wolters, and Claude Jacques were inclined to see Southeast Asians borrowing creatively what they found useful in Indian civilization. Sheldon Pollock's *The Language of the Gods in the World of Men: Sanskrit, Culture and Power in Premodern India* (2006) usefully proposed Sanskrit civilization as a common process throughout South and Southeast Asia, rather than a transfer from the former to the latter.

Histories of the whole region began to appear in English in the 1950s, typically from the pen of those who, like Coedès, had begun their teaching and researching within the region. The most influential such pioneer was D. G. E. Hall (1891–1979), who established the first British chair of Southeast Asian History at the School of Oriental and African Studies in 1949 and wrote an often-reprinted *History of South-East Asia* (1955). Hall had learned his Southeast Asia as history professor at the University of Rangoon (1921–34), partly from more experienced colleagues such as Burma prehistorian G. H. Luce and economic historian J. S. Furnivall (1878–1960). The latter's theoretical reach was broader through his comparative work to explicate Southeast Asian colonial societies, and his still useful *Netherlands India: A Study of Plural Economy* (1939) popularized the argument that plural societies resist the homogenizing effects of capitalism. The other colonial seedbed of historians of the region was the University of Malaya,

opened in Singapore in 1949 and eventually spawning a range of institutions in independent Malaysia and Singapore. Regional historians such as Northcote Parkinson, C. D. Cowan, John Bastin, Wang Gungwu, Jeyamalar Kathirithamby-Wells, David Bassett, Jan Pluvier, Anthony Reid, Leonard Andaya, and Barbara Andaya learned much of their Southeast Asian perspective by teaching in these institutions. By contrast, the strong generation of late colonial-era Dutch and French historians had difficulty finding successors amidst postcolonial bitterness and disillusion.

The initiative passed after World War II largely to the United States, Australia, and Japan. In the United States, there was significant work on comparative colonial history by Rupert Emerson and others before World War II, and a new wartime focus on the region stimulated by the Institute of Pacific Relations. Southeast Asian area studies made a vigorous new beginning, however, in the 1950s, notably at Cornell and Yale, focusing initially on the dynamic of the diverse new nationalisms. Pre-twentieth century history developed more slowly, initially reliant on colonially experienced British imports, with first D. G. E. Hall and then Oliver Wolters (working particularly on early Chinese materials) pioneering the teaching of the subject at Cornell University. Many of Wolters' students, and later those of Thai historian David Wyatt, pioneered the creative work of combining the chronology of colonial sources with the cultural and religious meanings found in often opaque indigenous chronicles. Special mention should be made here of Merle Ricklefs' (*b*.1943) pathbreaking volumes on Javanese history from seventeenth to twentieth centuries, starting with the Cornell thesis published as *Jogjakarta under Sultan Mangkubumi, 1749–92: A History of the Division of Java* (1974).

In the 1970s, Southeast Asian studies were in a slump in the United States, but booming in Australia, where many of the new graduates moved and graduate training began. Particularly, at the Australian National University in Canberra (Anthony Reid, David Marr, Ann Kumar, A. C. Milner, and later Craig Reynolds and Reynaldo Ileto) and Monash University in Melbourne (John Legge, David Chandler, and M. C. Ricklefs) important schools developed for the training of Southeast Asian historians in multidisciplinary area studies contexts.

Japanese historians also saw Southeast Asia as a kind of frontier for better understanding regional and global dynamics, free of the dominant obsessions with the West and China. Although some pioneers like Tatsuro Yamamoto (prehistory) and Seiichi Iwao (colonial and maritime) began doing seminal work in the 1930s, Japanese historians began to make a bigger mark internationally from the 1970s. For modern Indonesia some trained at Cornell, like Akira Nagazumi (1929–87) at Tokyo University and Takeshi Shiraishi, who also taught at Cornell (1987–96) before moving to Kyoto and in 2007 to head the regionally focused Institute for Developing Economies (IDE) in Tokyo. The strongest Japanese contribution to understanding Southeast Asian history was, however, that of Japanese-trained scholars working on the societies of Mainland Southeast Asia. Their work was much better informed by Chinese sources than that of Western or local historians, and it showed a rigorous empirical spirit in economic history. Japanese writing on the history of rice agriculture in Southeast Asia was particularly strong, as demonstrated for English readers in the volume edited by Yoneo Ishii, *Thailand: A Rice-Growing Society* (1978), or some of Yumio Sakurai's work on Vietnam and Junko Koizumi's on Thailand. Much of this work was concentrated in specialist organizations set up in the 1960s, such as the IDE (1958), the Center for Southeast Asian Studies at Kyoto University (1965), and the Tokyo University of Foreign Studies (1949, on older roots).

The initial focus of the new nationalisms made the first generation of American-trained historians little inclined to perceive the region as a whole. The most important US history of the region, *In Search of Southeast Asia* (Steinberg, 1971), required the collaboration of six country specialists and is basically divided by country. The teaching of Southeast Asia outside the region itself requires a regional approach, however, and as new approaches were sought many of them found it helpful to choose a broader (or narrower) focus than the nation states. The *Cambridge History of Southeast Asia* (ed. Nicholas Tarling, 1992), dominated by historians based in Australia, New Zealand, and Southeast Asia, took the heroic line that each chapter should cover the whole region, but be chronologically and thematically demarcated.

The approach of Fernand Braudel and the *Annales* School was brought to Southeast Asia in the 1980s in relation to the Early Modern, a period that had until then been largely abandoned to the 'European expansion' school. Denys Lombard (1936–98), founder of the interdisciplinary journal *Archipel*, developed in *Le Carrefour Javanais: Essai d'Histoire Globale* (3 volumes, 1990) the kind of 'total history' favored by the *Annales*, seeking to peel off progressively the Western, Islamic, and Hindu–Buddhist layers of his subject. Anthony Reid (*b*.1939) acknowledged a debt to Braudel in his *Southeast Asia in the Age of Commerce, c.1450–1680* (2 volumes, 1988–93), notably his interdisciplinarity, his 'mediterranean world' focus, and his elevation of structures, *mentalités*, and the everyday above political *événements*.

Reid's proposed pan-Southeast Asian coherence and a mid-seventeenth century general crisis, shifting the Southeast Asian trajectory away from engagement with world commerce and ideas, were robustly countered by Victor Lieberman. He perceived striking continuities in the way state consolidation proceeded in Mainland Southeast Asia, from 23 polities in 1340 to 3 by 1820. His insight that this consolidating process was common also to parts of Europe led eventually to the most ambitious exercise in world history by a Southeast Asianist, Lieberman's *Strange Parallels: Southeast Asia in Global Context, c.800–1830* (2 volumes, 2003–09). This rejected European exceptionalism by explaining the parallels between what he called the 'protected zones' of Eurasia – western Europe, Japan, and Mainland Southeast Asia – because they were environmentally protected as Russia and China were not from the great continental movements of nomadic horsemen. Lieberman's work also extended Reid's use of climatic factors to explain some of these parallels, identifying a number of other crisis moments such as the fourteenth and late eighteenth centuries.

Most of the controversies in the field occurred on a narrower stage. The unusual prominence of women, and of entrepreneurial Chinese minorities, in Southeast Asia has received

increased attention by the newer historians. The rise of China has again problematized interstate relations in the precolonial era and the nature of the 'tribute system' by which Southeast Asian polities had conducted commercial and political relations with the north. Here as elsewhere environment, sexuality, body, and health are ever more central to younger historians. Perhaps the most sensitive issue is that of state violence since independence. Although the Pol Pot regime (1975–78) fell long ago, and President Suharto in 1998, the large-scale massacres they perpetrated in Cambodia and Indonesia (1965–66), respectively, remain inadequately explained and bitterly controversial. In Burma/Myanmar, Vietnam, and Laos, the regimes that perpetrated violence against opponents and minorities are still in a position to restrict discussion of these matters internally. Contrary to earlier expectations, the prestige of academic writing in English has strengthened even within the region, driven by the usual global competitive factors, although only Singapore and the Philippines participate significantly in it. Elsewhere, the most vigorous vernacular historical debates are not in academic forums but in newspapers, films, and popular novels such as the remarkable four volumes written in internment by Pramoedya Ananta Toer (1925–2006), describing the birth of Indonesian national consciousness in the early twentieth century.

This article is reproduced from the previous edition, volume 10, pp. 6813–6817, © 2001, Elsevier Ltd., with revisions made by the Editor.

Abstract

This article covers the recent origins of written history in sub-Saharan Africa, the 'discovery' and scrutiny of its oral history traditions, the interaction of anthropology and history, the Anglo-American debate about the nature of sub-Saharan African historiography, and the role of the diaspora both in Africa and more broadly. Despite continuing economic dependence, indigenous perspectives upon sub-Saharan Africa and its history are growing, fostered in part by the diaspora itself across Europe, North America, and Asia.

This article concentrates on sub-Saharan Africa. It covers recent origins of written history, the 'discovery' and valuation of its oral traditions, the interaction of anthropology and history, the Anglo-American debate, and the role of the diaspora. Intellectual dependence resembling the economic impasse of the continent is worsening. A glimpse at what is on the horizon suggests the tide is turning, the groundswell stemming from the unprecedented creativity of local bards, both griots and other producers of historical material. In fact, a wider influence of African studies on intellectual life can be detected. This resurgence is amplified by the diaspora, which actively propagates its share of the African experience. Hope is raised by the fact that disciplines applied to Africa are inevitably linked to academic trends in Europe and the US. No longer cramped by a narrow view of a particular field of study, Africanists have demonstrated the benefits of multidisciplinary collaboration. In addition, Africanists have been instrumental in fostering a dialogue and creating an interface between traditional academic approaches in Anglo-Saxon and French-speaking countries.

The discovery of Africa as an object of scholarly research is part of a wider expansion of academic pursuit. It coincided with the emergence of women's studies. The focus of investigation shifted to the underdogs, including slaves, colonized nations, and other silent majorities of our day as well as the Middle Ages, in Africa, and elsewhere (Wachtel, 1971; Clancy, 1979; Ginzburg, 1980; Feiermann, 1993).

This article concentrates on sub-Saharan Africa. It covers recent origins of written history, the 'discovery' and valuation of its oral traditions, the interaction of anthropology and history, the Anglo-American debate, and the role of the diaspora.

Origins of History

The first Sahel states emerged on the northern fringe of the savanna: Ghana (eighth to eleventh century), Mali (thirteenth to fourteenth century), and Songhay (twelfth to sixteenth century).

Arab authors were the most knowledgeable on Africa's past. Those who made the largest contributions to reconstructing the history of Africa, and Western and Central Africa in particular, include al-Bakri (1029–94), al-Idrisi (1154), al'Umari (1301–49), and Hassan Ibn Mohammed al-Wuzza'n, known as Leo the African (1494–1552). Ibn Khaldun (1332–1406) is unquestionably the 'Father of History,' even though Ibn Battuta (1304–69) remains the best thanks to his personal accounts and the detail in his descriptions (Levtzion and Hopkins, 1981).

Written European sources followed, beginning in the fourteenth century. Their authors were Portuguese navigators. These documents preceded the substantial addition made by codification or oral records in Arabic by Mahmoûd Kâti and Es-Sa'di, both Timbuktu scholars.

In the course of the nineteenth and twentieth centuries, accounts written by Africans in indigenous languages have abounded. A large share of these histories was in Kiswahili, Hausa, Fulfulde, Kanembu, Diula, and Malagasy.

The first professional historians, caught in the Hegelian trap, discounted the history of Africa (Neale, 1986; Mudimbe and Jewsiewicki, 1993: p. 1). However, the continent and its 'people with no history' were deemed worthy of a present. Ethnography was called upon (Mudimbe and Jewsiewicki, 1993: p. 8) to justify the backwardness of the region. Underdeveloped Africa was expected to make do with a 'prehistory' (Moniot, 1991: p. 197).

The International African Institute was established in London in 1928. The School of Oriental and African Studies began in 1948 to teach a new subject called history of Africa (Vansina, 1992: p. 77). An overdue offspring of academic research was born. Curiously, African universities in French colonies, the local intelligentsia, and their backers in France did not see any need for the discipline (Vansina, 1992; Moniot, 1995: p. 647).

History and Anthropology

Almost 8 years after the publication of *African Historiographies* (Jewsiewicki and Newbury, 1986), Jewsiewicki and Mudimbe published *History Making in Africa* (1993). The majority of the authors who contributed to the former work were historians. Anthropologists dominated the latter. This shift in the weight accorded to the two disciplines is a sign of the times. When focused on Africa, anthropology and history do not fit neatly into the university compartmentalization scheme. Rebellious grassroots reality has gradually overcome the rigidity that had governed the allocation of professorships.

As time passed most of the convenient cubbyholes have been banned to the realm of memory. It was once the fashion to contrast societies with no history, acephalous, precapitalist societies, with societies blessed with a state and a history culminating in capitalism. The first group was viewed as inherently handicapped by communalism, polytheism, oralism, and tribalism. The second group of nations was endowed with the virtues of individualism, monotheism, literacy, and polity, to name just a few. Criticism of the concepts of tribe and ethnicity took two different approaches, a French school and an Anglo-Saxon school (Coquerel, 1983; Young, 1986; Chrétien and Prunier, 1989; Barber et al., 1990; Coplan, 1991, 1993; van Jaaresveld, 1992; Harries, 1993; Jenkins, 1997).

The adoption of precolonial Africa as a concept for a catchall analysis of the continent marked a milestone. This approach created the illusion of a different, idealized world. Postcolonial Africa was viewed as the child of a past to which the umbilical cord had been severed. This is the country cherished by the nationalists during their struggle for independence and the image invoked by politicians. Cheikh Anta Diop was fond of climbing the continent's family tree back to its glorious Egyptian ancestors, while Joseph Ki-Zerbo (1972) and J.F. Ade Ajayi convey us to a not so distant past, labeled the precolonial era (Mudimbe and Jewsiewicki, 1993: pp. 1–2). Historians responsible for this breakdown into periods have changed their minds and now support the anthropologists' view of the existence of a continuum between the colonial societies and their worthy successor, sovereign Africa (Bayart, 1989; Piault, 1987).

The focus of historians on the past and the concentration of ethnologists on the present explain the farsightedness of the former and the shortsightedness of the latter. The outlook of these two isolated disciplines changes radically as soon as historians discover humanity as the center of their field of investigation and anthropologists take account of time, the framework for human behavior, and activity.

The Silent Make Themselves Heard

Africa is known for its chanted, sung, or simply recounted oral history. The *griots*, professional chroniclers of West Africa, the *biiru*, specialists in Rwandan royal ritual, and ordinary storytellers in the cities and the country have provided a wealth of material to researchers accustomed to studying written material.

In 1962, Jan Vansina published his authoritative work, *De la tradition orale*. His name is invariably associated with the acceptance of oral accounts as a source of African history and with the elaboration of a rigorous scientific method. It took historians, or at least part of their fraternity, a long time to learn to appreciate the 'auriture' of oral genres (Coplan, 1991, 1993: p. 8).

Zealous pursuit of sources engenders such excesses as equating the death of an old timer with the gutting of a library. This attitude refers us to a kind of precolonial library, to paraphrase Mudimbe. It is also called the memory of the griots and 'oral archives' (Bazin, 1979: p. 450). Writing history Western style entails the fault of reducing documents recorded by interviewers to simple sources. This is denounced by Jewsiewicki (1986: p. 16) and Shoenbrun (1993: p. 55).

An increasing hue and cry (Farias, 1992) has been raised in opposition to this tendency. The critics are anxious to upgrade the role of reputedly passive traditionists (Ba, 1980). While David W. Cohen (1989: p. 12) insists on the contrast between material provided by the Africanist community and that produced by Africans who collect data on a daily basis, Jan Vansina was an early advocate of another reading of these documents, as revealed in a text of Jewsiewicki (1979: p. 81).

As soon as we escape the pull of the two fetishes constituted by the roving reporter and the Western-style historiographer, we are attracted by other types of history, and vice versa. We can then pay heed to nonformalized oral texts, unofficial samples taken from lower rungs of the social ladder. Their particular form and their nonverbal character require another method of analysis, yielding a more fertile approach to Africanist research (Olivier de Sardan, 1976; Diawara, 1990; Barber, 1991). The field is further enriched by the involvement of anthropologists who tap the upstream end of oral production and characterize its interface with society (*surface sociale*). Their tools bridge a major gap neglected by historical studies, which concentrate entirely on the oral text and lose sight of the life, environment, and experiences of participants in society (Moniot, 1986: p. 58).

The history of the continent has become a professional endeavor. It involves "interrogating and revealing the historian's operation" (Moniot, 1995: p. 647). From now on, the Africanists can forget the "automatic legitimation of being specialists in a small exotic field" (Cooper, 1995: p. 236).

The Anglo-American Debate

Vansina (1992: p. 91) takes advantage of the lessons of historiography consisting in recognizing the past in the present and vice versa, and aims his harshest criticism at the postmodern drift of David W. Cohen. The latter (1994: p. XV) stresses the fact that historical knowledge is not the monopoly of poetry or formalized narratives but that it is constantly being proclaimed and cited. Henige (1995: p. 314) vehemently attacks what he calls Cohen's "predilection […] for subordinating the substance of sources to their interpretation."

The Diaspora Includes Africa; In Fact, It Is Africa

What position do African specialists take in this controversy, which almost boils down to an 'American–American' debate? Jewsiewicki (1986: p. 9) makes a statement that has lost none of its pertinence for historians and other Africanists, "The Africanist historian and the African historian share neither the same responsibilities nor the same existential constraints" (cf Vansina, 1994: p. 221). This is certainly true, except that another schism has split the African scholars' camp, divided between a diaspora and a home community, and occasionally bridged by a coming and going between the two shores. Africans abroad still focus more on debates that are often kindled overseas, in America or Europe.

Nevertheless, practically everything written is in the language of academics, which is not the idiom of indigenous populations. A UNESCO policy to remedy this situation, adopted in the

1970s, remains a pious vow even though issues of *l'Histoire Générale de l'Afrique* have appeared in Kiswahili and Hausa. Anyway, who is able to read them? Where can you get a copy and what would it cost? Does the body of literature constitute history for the average person? The question posed by the *African Historiographies* subtitle, 'What history for which Africa?' is as relevant as ever. The role of Africans in this international forum appears to be rather marginal. The empire of Western historiography is bigger than ever (Vansina, 1994: p. 220). The hopes raised by studies in the English-speaking world, which benefits from the North American alternative to the intellectual heirs of the British Empire and from a more substantial organization (Jewsiewicki, 1986: p. 15), continue to fade. In the meantime, the New World option has become an attractive outlet for the brain drain from tropical dictatorships. Zaire has forfeited its chances to develop a school of thought liberated from the domination of Brussels. The ex-colonies reproduce the models elaborated in the former centers of colonial power (Chrétien, 1997) despite the fact that English-speaking and French-speaking African authors have begun to read one another's works (Coquery-Vidrovitch, 1997). Their marginality becomes even more pronounced as the tendency to consume (È Nzièm, 1986: p. 25) concepts developed outside Africa grows. It makes little difference whether they are the products of non-Africans or of Africans of the diaspora, which never stops expanding (Jewsiewicki, 1979: p. 81).

Intellectual dependence resembling the economic impasse of the continent is worsening. While additions to the circle of recognized Africanists are becoming rare, a heavy storm of productivity is brewing in Africa, as far as reading about and interpreting the past are concerned. Student theses, cassettes recorded by individuals in different villages, radio stations, and other relevant institutions are mushrooming. The harvest has never been so bountiful (Cohen, 1994: p. XV; Diawara, 1997).

This analysis is not intended to deny the essential, unanticipated impact of African studies on social sciences in general. The 'dissolution of world history' by the history of Africa is a reality (Feiermann, 1993). In evaluating African studies, one is inclined to dismiss the crucial role played by the diaspora, which actively propagates its share of the African experience (Macamo, 1999). Expatriates are deprived of their birthright by attributing any success they achieve to their severance of ties to their dismal native lands in the tropics. Mudimbe and Appiah (1993: p. 113), referring to the impact of African studies on American disciplines, cite the necessity "to locate ourselves as much in the current history of those disciplines as in the current state of African Studies […]."

In fact, a wider influence of African studies on intellectual life is detected – in Western Europe and elsewhere as well as in America (Feiermann, 1993: p. 200, note 13). The impact of Africanist historiography on that of France, the former métropole, is undeniable (Coquery-Vidrovitch and Jewsiewicki, 1986: pp. 143–144).

A glimpse at what is on the horizon suggests the tide is turning, the groundswell stemming from the unprecedented creativity of local bards, both griots and other producers of historical material. This resurgence is amplified by a foreign legion, which gives a boost to those who have remained on their native soil. Hope is raised by the fact that disciplines applied to Africa are inevitably linked to academic trends in Europe and the US. No longer cramped by a narrow view of a particular field of study, Africanists have demonstrated the benefits of multidisciplinary collaboration. In addition, Africanists have been instrumental in fostering a dialogue and creating an interface between traditional academic approaches in Anglo-Saxon and French-speaking countries.

Abstract

Historicism was a coinage of the later eighteenth century, when Novalis contrasted it with other methods of knowing (chemical, mathematical, artistic, etc.) and Schlegel associated it not with Kantian philosophy but with the modern science of philology. The term was occasionally used pejoratively in philosophical polemic but it blossomed in the work of the Historical Schools of language, law, and religion and in interpretation of the work of Giambattista Vico. It figured prominently in the early twentieth-century 'crisis of historicism' discussed by Ernst Troeltsch, Karl Mannhein, and others, and it was surveyed in philosophical terms by Friedrich Meinecke as a union of the principles of individuality and development. It continues today in scholarship, in both old and so-called new forms.

Historicism (German *historismus*, French *historisme*, Italian *storicismo*) refers to historical interpretation as opposed to abstract analysis of the past but it is also a term of constantly changing meanings and associations. The term is of Romantic origins associated first with the nineteenth-century German Historical Schools and then more generally with historical method as applied to all the arts and sciences and to human life as a whole. 'Historicism' (*historismus*) appeared first in a fragment of Novalis, who contrasted it with other methods (chemical, mathematical, artistic, etc.) and associated it with 'the system of confusion'. Contemporaneously, Friedrich Schlegel related historicism not to Kantian philosophy but to the modern science of philology. The word was occasionally used in philosophical polemics, and again the usage might seem pejorative since it was opposed to academic philosophy and especially unhistorical Kantian idealism. Felix Dahn argued, "historicism is above all a methodological moment, not a speculative principle…; its goal is [not philosophy but] life". Christlieb Julius Braniss opposed it to the reductionist and deterministic 'philosophy of naturalism', and in 1848 he distinguished between naturalism and historicism, which attempted to interpret all levels of existence in historical terms. In 1879, Karl Werner applied the phrase 'philosophical historicism' to the work of Giambattista Vico. This connection was later endorsed by Benedetto Croce, Friedrich Meinecke, Erich Auerbach, and others.

In 1895 in his inaugural lecture on the study of history, Lord Acton pointed to "that influence for which the depressing names historicism and historical-mindedness have been devised" – 'all things', for him, including law, theology, science, and philosophy itself. Yet he also wrote, "History is not only a particular branch of study, but a particular mode and method of knowledge in other branches", and "The great point is the history of history". Yet by the late nineteenth-century historicism had acquired a largely pejorative meaning because of its associations with relativism and the threats posed to the assumptions and values of philosophy, theology, and economics, which represented three of the absolutes of Western culture, nineteenth-century field of economics, especially in 1883 by Karl Menger's liberal assault on 'the errors of historicism', that is, the irrational methods of Gustav Schmoller and others members of the so-called younger historical school of economics. In a sense, this war of methods (*Methodenstreit*) recapitulated the struggles between the historical and philosophical schools in the nineteenth century. Now, however, such struggle deployed the weaponry of modern positivism and quantitative techniques. Liberal, market-based rejection of historicism, indeed of historical method in any sense, has persisted in many areas of social sciences, as well as in the humanities, as in Russian formalism, structural linguistics, and the New Criticism.

In theology the errors of historicism seemed equally offensive. In the pre–World War I years, religious controversies raged around the various forms of 'modernism', which had been denounced in Pope Pius IX's 'Syllabus of Errors' of 1864, and were accompanied by a whole list of other secularizing '-isms'. Positivism, psychologism, and historicism all posed threats not only to traditional moral values but also to the validity of both reason and revelation. The historicizing of Christianity was the avowed aim of the historical school of religion (*religionsgeschichtliche Schule*) headed by Max Weber's friend Ernst Troeltsch, whose classic work, *Die Soziallehren der christlichen Kitchen und Gruppen* (1912), marked the intersection of the socioeconomic and theological problematics of historicism; and this discussion too, was carried on with heavy anxiety about questions of traditional norms and the elimination of metaphysical and metahistorical absolutes.

Philosophers had worried about the threat of history since the late eighteenth century, and their anxieties resurfaced in the early twentieth century as a 'crisis of historicism'. In 1910, Edmund Husserl denounced historicism as the enemy of 'philosophy as a rigorous science'. Martin Heidegger, following Friedrich Nietzsche's famous critique of 'the use and abuse of history', contrasted it with true historicity (*Geschichtlichkeit*) grounded in contemporary existence. Like Braniss, Troeltsch opposed 'historicism' to 'naturalism' and traced this war of methods back to the seventeenth century with special reference to Vico's attack on Cartesianism; and he celebrated historicism for removing the 'dead hand' of dogma while at the same time fearing the threat it posed to philosophical and moral tradition. Following Troeltsch, Karl Heussi distinguished between 'history for the sake of history' (*l'histoire pour l'histoire*),

relativism, radical evolutionism, and speculative philosophy of history and analyzed them all under the rubric, 'the crisis of historicism'.

Historicism represented a problem for all the human sciences and, for Karl Mannheim, it constituted a complete *Weltanschauung* beyond the level of conscious reflection or ideology, so that history itself was caught in its net. It served the modern dynamic world as 'timeless reason' had served a more static world. "Historicism has developed into an intellectual force of extraordinary significance", he says; "it epitomizes our *Weltanschauung*… The historicist principle not only organizes, like an invisible hand, the work of the cultural sciences (*Geisteswissenschaften*), but also permeates everyday thinking." For Mannheim, historicism was a product not only of 'mere' historiography but of 'problems involved in the new ways of facing life'. Yet like Meinecke, Mannheim's purpose is to situate historicism within the confines of formal philosophy. As a counterpart to the older faith in reason, now itself historicized, historicism also needed to be the object of critical theory. Yet historicism was not absolute, but rather bound to assumptions and spatial, temporal, and material conditions that had undercut universalist conceptions. The virtue of historicism for Mannheim was that it set dynamism at the center of its conceptualizations instead of relativizing it as in 'the old static system'. In this way, historicism became 'the Archimedean lever' for the modern worldview and life experience, that is, made it in effect the condition of human, historical, and indeed philosophical understanding.

Croce, following his predecessors Vico and Hegel, thought that the Germans had not pushed historicism far enough. He rejected the claims of modern social science, such as those of Weber and Emile Durkheim, to universal status, regarding them all as open to contingency and subject to historical conditions. Human values had the same continent status, and Croce had no fear that relativism was a major threat, since for him historicism was "a logical principle…, the very category of logic." In Germany, historicism was the reigning condition of contemporary thought and life – and according to his famous aphorism, "every true history is contemporary history". Indeed philosophy itself was 'absolute historicism', so that historicism was not the source of the intellectual crisis of the twentieth century but rather its potential solution. Croce's views and prejudices were carried over into the Anglophone world by R.G. Collingwood, who translated his work and followed his interpretation of historiographical tradition and who turned back to the classical view of history as a form of 'inquiry' into human behavior, proceeding through the interpretation of evidence and aiming ultimately at 'human self-knowledge'.

The best known interpretation of historicism was Friedrich Meinecke's *Die Entstehung des Historismus* (1936; trans. *Historicism*: *The Rise of a New Historical Outlook*), which offered a comprehensive map of European historical thought since the seventeenth century and gave systematic and philosophical form to the Rankean principles of individuality and development. As 'forerunners' he recognized the Lord Shaftesbury, Gottfried Wilhelm Leibniz, Gottfried Arnold, Vico, and Joseph-François Lafitau, who all reflected the rejection of natural law, abstract reason, and universal laws as the primary way to understand life over time. Historicism was the product of 'the loosening up of dogmatic and ecclesiastical thought after the wars of religion' and the rise to prominence of the key principles of individuality and development. Vico was important but also a 'solitary and unrecognized figure' and continued to assume that God ruled the world, though he realized that nature was a process of development, which had its own laws. Lafitau contributed to the historicist outlook by his comparative study of Native American Indians with savages of antiquity.

According to Meinecke, Voltaire was the first great cultural historian, and he published his 'essay' on universal history of civilization and the 'human spirit' in 1769. The restriction of his point of view was shown in his study of the age of Louis XIV, which he regarded as superior to any previous age in history. Another candidate for primacy was Montesquieu, who applied 'empirical realism' to the science of politics, though his notions about geography and climate reintroduced a kind of determinism that Meinecke found retrograde. Yet Montesquieu had significant views about the ideas of individuality and development so crucial to Meinecke's idea of historicism. As Voltaire spoke of the 'spirit' of peoples, so Montesquieu spoke of the 'spirit' of the laws, though Voltaire had more of a historical perspective. Other significant French historians of that age included A.R. Turgot, Antoine Condorcet, Antoine Goguet, and Nicolas Boulanger. These were exceptional figures, in Meinecke's view, since unfortunately the abstract notions associated with the French Revolution "froze history and historical thought into a fixed and static state".

For Meinecke, British contributors to historicism started with David Hume, who was a philosopher before he was a historian and had already begun passing beyond Enlightenment rationalism to an appreciation for the variety of human nature over space and time. Hume also rejected religious belief for a considered Deism, and he treated English history as a development. Edward Gibbon showed a 'world historical grasp of his subject', and he had a sense of 'the community of peoples closely bound together by their intellectual outlook and their destinies'. The third great historian of the English Enlightenment was William Robertson, whose work 'illustrates a certain progress in the handling of universal history'. Robertson also had a good idea of the development of peoples from a primitive stage. In the great intellectual transformation leading to the Romantic movement ideas of the two great classics of Western tradition, Homer and the Bible, also marked important changes. In 1766, Adam Ferguson, friend of Adam Smith, published a book on the history of civil society, says Meinecke, "along sociological and positive lines" from a primitive level to that of the high culture of the Enlightenment, and some of his remarks constituted 'a sign of a new age of historical thought'. A greater figure contemporary to Ferguson was Edmund Burke, who (like Justus Moser in Germany) tried 'to infuse new life into the nature of the state'. He saw the dangers of the ideology of natural law and revolution and turned to traditionalism as the key to history. According to Meinecke, Moser tried to read the effaced writing of the past in the palimpsest of the present, though for Meinecke, this was not yet quite full-blown historicism.

For Meinecke, the first large-scale expression of historicism came in Germany, and again he attends to familiar names – four main figures – of German thought to illustrate his argument. G.E. Lessing had a great appreciation of the principles of individuality and development, shown especially in his work

on the education of the human race (1780). However, the developing character of historicism was suggested still better in J.J. Winckelmann's *History of Ancient Art* (1764), which maintained contact with Herodotean *historia* and which referred to the history of the history of art. Moser was concerned with local and antiquarian history and thus to the individualizing aspect of historicism, and in his theory of 'total impression' he showed an awareness of individual psychology and social patterns, or cultural synthesis and continuity, in history. Karl von Irwing (not mentioned by Meinecke) was among the first to adopt (in 1779) the terminology and conceptualization of 'culture' (derived from the Latin *cultura*, meaning the cultivation or mastery of material or spiritual activities), and he posited a series of evolutionary stages from the state of nature to mature civilization expressed most fully in the nation-state and the arts and sciences necessary for this institution. In the late eighteenth-century Germany 'culture' (*Kultur*) came to replace 'spirit' (Geist, esprit) as a way of expressing the character of society, and it was adopted by a number of scholars who restored the juncture of learning and thought, although Meinecke discusses only J.G. Herder.

According to Meinecke, the greatest of the pioneers of historicism in the early years were Moser, Herder, and Goethe. Herder began as a literary critic and ended as a philosopher of history. His early work was on primitive poetry, myth, and language, but his efforts then expanded into larger studies of national life, especially in Germany, and as Meinecke remarked, he "portrayed himself in the character of Petrarch". In 1774, there appeared his preliminary study of the philosophy of history, and then his major work on the topic 10 years later, which extended the ideas of national individuality and development not merely to Germany but to a whole range of nations. In his organic view of history, shared with other Enlightenment scholars, he proposed a conception of several progressive stages of development. He simultaneously shifted from describing the 'spirit' of a people to describing a people by its 'culture'. At the end of his life, and under the influence of Hamann, he reinforced his distrust of rationalism with a 'metacritique' of Kantian abstract metaphysics by insisting that 'One thinks with words' and philosophy loses its human base when it tries to go beyond language – and so history. The proper question was not 'what is reason?' but 'what is humanity?' To his mind, of course, humanity had to be understood in terms of its origins, languages, and development. Meinecke does not mention this work, nor is it much appreciated in histories of philosophy.

"Goethe was only marginally a historian," Meinecke admits, but "Without Goethe we should not be where we are." For Goethe too, as 'Herder's pupil', history was part of nature and also had 'laws of development'. For him, 'the past and the present are one', and Meinecke examines Goethe's views on art, literature, life, travels, and world events at the time of Napoleon to show his adherence to the principles of individuality and development. For Goethe, 'history must always be rewritten'. This appreciation of Goethe concludes the survey of early historicism offered by Meinecke, who overlooks the linguistic and literary – and indeed in many ways the antiphilosophical orientation of historicism as it emerged in the age of Romanticism. Meinecke also neglected the contributions of the Historical School, Barthold Georg Niebuhr, J.G. Eichhorn, Karl Friedrich von Savigny, Jakob Grimm, Wilhelm Roscher et al., and the scholarly tradition as a whole. By reducing historicism in effect to a philosophical doctrine Meinecke violates the original impulse, for in general historicism was not a theory but a scholarly practice and a mode of interpretation. It was part of an effort not to make history into a philosophical doctrine but rather to transform it into a foundational discipline to which philosophy itself could be subject.

In 1796, J.G. Eichhorn joined cultural and literary history in a way that showed the connection between literature or language and history in a prophetic statement: "The history of arts and sciences, their origins, progress, and various transformations can never be separated from the history of the social conditions, for culture and literature are twin sisters, children of the same father, who continually provide support for each other. Culture, the first-born, prepares the birth of her younger sister, and thereafter they live and work together, inseparably and unseparated, and also die together. Without the history of one the life of the other is incomplete and incomprehensible." Eichhorn was one of those scholars who inaugurated the 'higher criticism' of the Bible, which was followed by the mythological criticism of David Friedrich Strauss. Biblical criticism, too, became an adjunct of the Historical Schools. In general, as G.P. Gooch put it, "The scope of history has gradually widened until it has come to include every aspect of the life of humanity."

One of the main products of historicism in full flower was the Prussian School of historical writing, of which Heinrich Treitschke, son of an ennobled Saxon general, was perhaps the leading and most passionate figure. Treitschke was a supporter of Bismarck and in 1874 he moved to the University of Berlin. After Treitschke, came Leopold von Ranke, who took a more neutralist attitude toward history, and turned the agenda of historicism toward political history. "The chief creation of more recent history," remarked Burckhardt, "is the Great Power, the life form of the most significant peoples." In the nineteenth century German historians sought continuity in their national tradition and the character of their people and institutions, and they were frequently followed in this by other national historians, including France, England, and the United States toward political history, and Burckhardt, whose work helped turn historical studies to cultural and artistic history. The older 'new history' in Germany, France, and the United States (though not England) continued this culturalist turn in the work of Karl Lamprecht, James Harvey Robinson, and later the Annales school. Meinecke and Troeltsch came to the University of Berlin in 1914 and 1915 (in history and philosophy), respectively, and their views were central to the discussion of the 'crisis of historicism' in the 1920s.

The later semantic history of historicism has become increasingly muddled because of misappropriations of the word for philosophical or ideological but quite unhistorical or even antihistorical purposes, beginning with Karl Popper's Poverty of Historicism (1957), which identifies historicism with naive biological determinism (precisely the opposite of the view of Braniss) and a total innocence of history, experience, and even common sense. Another instance is the book of Maurice Mandelbaum, who writes in *History, Man, and Reason*, "Historicism is a belief that an adequate understanding of the

nature of any phenomenon and an adequate assessment of its value are to be gained through considering it in terms of the place which it occupied and the role which it played within a process of development." Michael Gillespie, along similar lines, thinks historians go 'critically astray' in tracing the source of historicism to the attitudes associated with historical scholarship, especially that of early modern Europe. On the contrary, historicism was and is an alternative to conventional philosophy and scientific naturalism, and it flourished in the rich soil of literary and antiquarian learning and the teachings of the Historical Schools. In fact historicism is positioned in opposition to the scientisms that evade questions of point of view, perspective, cultural context. It emphasizes the necessity of interpretation in posing questions about a past that is not only a 'foreign country' but also largely inaccessible except through traces and testimonies which happen to have survived and which must be expressed in the language and conditions of the present – a present that is itself on its way soon to becoming a past.

The so-called New Historicism, popularized since 1980, goes back at least to 1942, when Croce wrote, "The New Historicism accepts, extends, and applies Vico's principle that men know only what they do." The newer New Historicism, though avoiding philosophical claims, likewise turns, as Vico had done, to cultural forms, especially literature and art, as a way of revealing underlying interests and power structures and penetrating to inarticulate levels and marginal groups of society. In general, this New Historicism was part of the linguistic and textualist turn taken by history and the human sciences, including philosophy, in the past generation. Included too were the closely allied innovationist movements that call themselves 'the new cultural history' and 'a new philosophy of history'. Despite attempts to deprecate the Old Historicism on ideological as well as methodological and terminological grounds, the New Historicism shared or inherited some of the same assumptions and goals and in a long perspective forms part of the same story.

Abstract

Ever since Aristotle, theoreticians have analyzed the differences and commonalities of narration in historiography and literature. Both in the modern novel as well as in modern historiography one has tried to get rid of narration as a basic principle. Narration survived all new experiments in the two areas. The interrelation of factual and fictional narration is on the mind of many theoreticians these days. Hayden White's thesis of the poetic structure of historiography has been discussed in a controversial manner. In order to point out the differences in the two modes of narration one has to understand the varying truth concepts behind historiography and the novel. As Käte Hamburger has pointed out, it is the as-if structure of fiction that makes the novel different from historiography. What both forms of narration have in common are the creation of meaning, the function of memory, and the formation of identity.

Literature and history have many things in common and one of them is the aesthetic form of narration. The many contemporary experiments notwithstanding, modern historiography and the modern novel still share the common feature of narration. In narratology, some theoreticians have differentiated between the narrative modes in the two fields; others have shown how they conflate and that they can hardly be distinguished. This article wants to show what narration in literature and history has in common and in what respect the two modes differ from each other.

For Aristotle (see Chapter 9 of his *Poetics*) the matter of the division of labor between historiographer and poet was easily decided: the historiographer relates 'what has happened' and the poet 'what might happen.' In contrast to Plato's devastating criticism of literature, Aristotle considered poetry to be of high value. In his eyes, literature dealt with problems of a more general and thus more significant nature, while the historian had to report about specific, and thus, less important matters.

Until approximately 1750, historiography was considered a branch of literature. Since the eighteenth century (when Aristotle's distinctions were rediscovered), the differences between the two disciplines have been stressed, and it was only then that the term 'literature' became synonymous with 'poetry' and 'fiction.' Gottsched and Lessing still shared Aristotle's prejudice against history. For them the field of history was merely a quarry from which they mined some of the raw material they used to build their preconceived literary plots. Of real importance to them was a moralistic story, and examples were taken from the repertoires in the areas of history, legend, and mythology. However, the late eighteenth century is an important turning point. As Koselleck has demonstrated, it is the time of the development of a genuinely new philosophical awareness about history (Koselleck, 1976). The concept of a continuously progressing history as such replaces both the religious concept of a Christian teleology as well as the idea of history as a chaotic conglomerate of countless individual stories of an exemplary nature. Through this philosophical development, literature is seen as part of history and thus it loses its Aristotelian superiority.

Today, the relationship between fiction and historiography poses a number of hermeneutic questions, and there is no modern Aristotle who might offer a simple and acceptable solution fitting for our time. Narration can be viewed as one of the primary tools of knowledge and it determines the structure and aesthetic form in the presentation of a real or a fictional event. Narration discloses the dimension of historical reality as well as the sphere of poetic fiction. The logic of narration provides access to the logic of historiography and fiction; it makes the structure of both historical consciousness and fantasy tangible. In every narrative, real or fictional events are supported by a structure through which happenings are accentuated, selected, or eliminated according to the law of relevance. Neither in historiographical nor in fictional narration are we dealing with a reproduction or duplication of events, but with a certain organization of actual or imaginary occurrences or experiences.

Narration in Historiography

Perhaps because it is so difficult to liberate it from its established forms, narration is constantly under attack. In the discussion of modern historiography from 1970 to 2000, it looked as if 'narration' would be replaced by 'description' and 'explanation.' 'Historiography,' Szondi argued, must "divest itself increasingly of its narrative character"; narrative historiography must "turn into description if a new concept of history is to do justice to our knowledge of history as an anonymous process, as a sequence of events and changing systems" (Szondi, 1973). The arguments of the antinarrativists can be summarized in the following way: the narrative recording of events in historicism was based on the belief that history was made by individuals. However, this categorization did not adequately take into account the development of social processes. Processes and structures can only be described not narrated. Thus the old *histoire événementielle* has to be replaced by the new *histoire structurale*. 'The nouvelle histoire' of French historians in particular, with their descriptions of structures underlying long periods of time, and their quantifying methods, forced the old paradigm of writing history by narrating events into a defensive position (Furet, 1982; LeGoff and Nora, 1974).

However, according to some historiographers, history as a narration of events and history as a description of structures are not mutually exclusive. These historiographers concede that history as a narration of events is no longer the center of the historiographer's work and that it no longer provides the obvious support of historical writing. Nevertheless, they also concede that narration is allowed to stand as a possibility alongside the writing of history as a structural analysis of processes (Borst, 1976). Other scholars will have nothing to do with a strict separation of the two methods and point out that narration and description are intertwined. The argument is that the fact that modern history is a series of processes, it can only be understood through the alternate explanation of events through structures and vice versa (Koselleck, 1976; Kocka, 1984). Although the structures become more accessible through description and events through narration, nevertheless in practice it would be impossible to maintain a demarcation between the two methods. The complementary characters of description and narration are increasingly emphasized (Stone, 1979).

The defenders of the descriptive method like to confront the narrators among the historiographers with their lack of theory. They assert that the historiographer must not only narrate but also explain, and that this is only possible by means of a theoretical concept of the realities, as it has long been practiced by social scientists. The proponents of the narrative method in writing history defend themselves vehemently against the charge of being antitheoretical. From their initially defensive position, they have turned to attack. Danto has asserted that narration is vital for description and explanation; that the form of narration is at the same time a form of explanation. The narrative form always surpasses the given and categorically uses all-encompassing concepts. Narrative structures influence our historical thinking in the same way theories do in the case of the sciences (Danto, 1965). Ricoeur expresses the same idea in his phrase "to tell a story means to explain it" (Ricoeur, 1983). Rüsen agrees that narration is a part of the logical structure of historiography and that consequently "description and explanation have a function subordinate to the narrative scheme" (Baumgartner and Rüsen, 1982).

Narration in Literature

In connection with Gottfried Benn's poetics, Grimm described a type of novel from which the narrator had disappeared. It was called "the novel of the phenotype" or "the inward directed novel," labels indicating a tendency toward lack of action and lack of characters (Grimm, 1963). The world and its events are banned here. The reduction of the 'I,' the isolated subject, is significant for this novel: the 'I' speaks only of itself. Consequently, one reads in Rilke's *Aufzeichnungen des Malte Laurids Brigge* from 1910: "It must have been before my time that stories were narrated, really narrated. I have never heard a person narrate a story." Benjamin's discussion of the decline of storytelling in his essay *Der Erzähler* about the Russian writer Nikolai Lesskow echoes Rilke's statement (Benjamin, 1972).

The aesthetic designation of the phenotype novel – exemplified in the novels of Virginia Woolf, Benn, and Rilke – is also appropriate for the writing of some contemporary authors; the authors of the French *nouveau roman* (like Alain Robbe-Grillet) as well as postmodern American writers (like William Gass) and contemporary German authors (like Peter Handke) come to mind. In the novel of the avant-garde (Joyce, Dos Passos, Gide, Döblin, Musil, Broch), narration was either complemented or largely replaced by montage techniques and cognitive means, by reflection or essayistic writing. Here it was not so much a matter of narration of events, action, and mimesis as one of the presentation of ideas and the provision of knowledge (Hinck, 1995).

However, the best-known postwar novelists (like Garcia-Marquez, Vargas Llosa, Philip Roth, Bellow, or Grass) uphold traditional established narrative models. One can write purely narrative novels. However, nonnarrative epic fiction is nonexistent. Like historiography, the novel obviously cannot dispense entirely with narration and thus it makes sense, now as ever, to adhere to the science of narrative technique (Lützeler, 1986). In the field of narrative technique, literary scholars are far ahead of the narratologists in the camp of the historiographers. Historians could learn from reader theories as developed by such literary theorists as Jonathan Culler ('the competent reader'), Umberto Eco ('the model reader'), Stanley Fish ('the informed reader'), Wolfgang Iser ('the implied reader'), Michel Riffaterre ('the superreader'), and Gerald Prince ('the narratee') (Culler, 1975; Eco, 1979; Fish, 1970; Iser, 1974; Riffaterre, 1971; Prince, 1982).

The Conflation of Historiography and Fiction

In *Metahistory*, Hayden White draws interesting parallels between historiography and fiction. He strives for a poetics of historiography and attempts to describe the forms of historical presentation in order to compare them with literary forms (White, 1973). White starts with the premise that no sequence of events – by itself – is a story; it is the task of the historiographer to transfer the events, the facts, to the narrative framework of a story. The connections between happenings do not occur spontaneously; they are the result of the historiographer's reflection. In each historiographical text, White distinguishes between the 'what' (the narrated events) and the 'how' (the type of narration, the 'emplotment'). He was not the only scholar to see that historiographical and fictional narration are related, but he was the first to make a systematic attempt to study the structure of historical consciousness – to show the fictional elements and their formal manifestations in historiography.

The situation in nineteenth-century historiography and philosophy of history serves as an example. White could have given his book the title *The Rhetoric of Historiography* as a parallel to Wayne C. Booth's 1961 study *The Rhetoric of Fiction*. In *Metahistory* he concludes that the writing of history has little to do with such qualities as true or false, correct or incorrect, and that ultimately historical writing cannot be distinguished from fiction. The historian's style, White argues, depends on the combination of the following elements: first, there are three different strategies; he calls them 'explanation by formal argument,' 'explanation by ideological implication,' and 'explanation by emplotment.' Specific modes of articulation correspond to each strategy. In this context we are only interested in the

strategy of 'emplotment' (narration) with its four corresponding 'poetic' modes of 'romance,' 'comedy,' 'tragedy,' and 'satire.'

White's references to certain structural similarities between the unfolding of tragedies or comedies and that of historical representations are interesting, but these similarities should by no means be construed as an actual fictionalization of history. Demandt has shown how thought structures were mirrored in the poetic metaphors used by historiographers, and how, in turn, the ideologies of the historiographers influenced their use of rhetorical figures (Demandt, 1978). However, the use of metaphors does not signify a fictionalization of history. There exist basic narrative concepts that are equally valid for historical and for fictional narration. Without action, images, and metaphors, narration per se is unimaginable.

Returning to White's example of the different depictions and interpretations of the French Revolution, it is evident that this is not a case of fictionalization because the historical process is not depicted as an 'as if,' but as something that actually did occur. No one will deny that the depiction of history is a creative process. However, its qualitative difference from fictional narration remains, despite the use of literary interpretation patterns and flowery metaphors. While fiction has as its basis the so-called 'as-if' structure, and thus proves to be pretense, illusion, and unreality, historiography always relates to actual events. Hamburger clarified the difference through the example of a historical report about Napoleon and a novel about the French emperor. The historiographer cannot see Napoleon 'in the subjectivity, the ego-originality of his inner thoughts, of his very "existence".' If he does so, however, we "find ourselves in a novel about Napoleon, a piece of fiction" (Hamburger, 1968).

The narrative techniques with which novelists depict the psyches of their characters have been analyzed by Dorrit Cohn. She differentiates between psychonarration, quoted monologue, and narrated monologue (Cohn, 1978). These are narrative techniques reserved for fictional narration, which cannot occur in historical writing. Just as the use of a literary (tragic or comic, for example) interpretive category cannot turn a historical narrative into a fictional one, a historical novel does not become a piece of historiography simply by including historical reality in the fictional field. Käte Hamburger validly defines the line between fiction and reality, 'where there is no crossing over from one category to the other,' when she discusses the different perceptions of mimesis in novel and historiography. According to her, there is a definite relationship between the narrating process and the narrated material in historiography, while characters created by novelists are simply narrated persons. In fiction, there is no relationship, only functional context, between the narrating process and the narrated material. In other words, the fictionalization of the persons described consists in the fact that the characters are not presented as objects but as subjects, as "ego-origines" (Hamburger, 1968).

This difference between historiography and fiction also becomes evident when we look at the results of more recent studies of the theory of functionality. Assmann has shown that scholars in the fields of analytic language philosophy and of pragmatic communication theory insist on this distinction (Assmann, 1980). In the analytic philosophy of language the point is made that fiction has a very peculiar status as far as its logic of statements is concerned: the authors of fiction are not obliged to come up with any proof; their judgments are quasi, pseudo, or as-if statements. In communication theory, fictionality is studied with respect to its reception effects: it involves the elimination of the normal connection that exists between the participants of an act of communication. Dealing with fiction leads to a temporary liberation from thinking in terms of fixed institutions; it means the absence of social sanctions and a lack of verification.

The Concepts of Truth

Historia vero testis temporum, lux veritas, vita memoriae, magistra vitae, nuntia vetustatis: Cicero's classic definition of the function of historical writing is still valid today – with a few deviations and reservations. The modern formulations are somewhat less pretentious, but given such terms as 'demand for truth,' 'imparting of meaning,' 'provision of identity,' and 'memory,' the function of historiography is not defined so differently from Cicero's wording. Only the postulate *magistra vitae* is viewed more skeptically. Authors of novels are equally concerned with the pursuit of truth, the imparting of meaning, the provision of identity, and memory. Friedrich Schlegel wrote in his introduction to the *Wissenschaft der europäischen Literatur*: "As history aims at recognition and truth it approaches science, but as it is also representation (…) it is related to art." Here the double-faced aspect of historiography has been precisely formulated.

No historiographer would be so arrogant as to assume that his or her report could encompass the whole truth of a historical event. Historiography can claim with justification that its statements are 'truthful' insofar as they have been gained 'scientifically,' that is in so far as they can be proven. And they can be proven because they can be proven wrong: the truth capacity of the narrative statements of historical writing is based on the fact that they can be falsified. In this respect, one can imagine no greater difference between historical writing and fiction.

Since the statements of a novel are fictional to begin with, they cannot be falsified. While writers of fiction may embellish an event from the past with fantasy, historiographers must check the sources, which dictate what they cannot say. The truth of a poetic statement is not achieved by fiction imitating the principles of historiography. The propensities for truth and truthfulness itself are presented differently in the two narrative modes. The intent to provide the truth does exist in both literature and historical writing, but it is aimed in different directions. Historiographers attempt to achieve the most exact comprehension and representation of actual historical events; novelists have no such ambition. On the contrary, their strength lies not in the realm of facts but in that of possibilities.

The aesthetics of the modern as well as of the postmodern novel are focused on the opening up of possibilities. Modernist literature aims to distance itself from the mimetic realistic principle that dominated the novel of the second half of the nineteenth century. Musil, for example, in *Der Mann ohne Eigenschaften*, plays with several types of utopias and arrives at the category of 'possibility,' in opposition to confidence in the power of history. The same is true in the postmodern novels of Thomas Pynchon.

The Concept of Totality

In examining the truth postulate in literature and historiography, one must consider the premises on which historical and novelistic narration are based. In traditional narration the novelist, like the historiographer, is guided by ideas of totality as we know them, on the one hand from the aesthetics of Hegel to Lukács, and on the other hand from Hegel's and Marx's substantialist philosophy of history. In both cases, the attempt is made to see events in such a way that they make sense within the context of a totality. Here the historical and artistic totalities are structurally identical. Danto has criticized as outdated the substantialist philosophy of history, with its concept of a teleological, continuous development. He states that this philosophy acts as if it knew of a 'divine plan' of history, as if one could determine past and present from the perspective of the future. Danto wants to replace the speculative and dogmatic substantialist philosophy of history with an analytical (descriptive and coordinating) theory of history. In this theory, the vantage point would not be from a postulated future goal back to the present and past, but rather from the past to the present, with no certainties about the future (Danto, 1965). The ancient trust, reaffirmed by Nietzsche, in the continuity of history is questioned, as are the Christian and Marxist tenets of the eschatological or utopian direction of history.

Such beliefs once formed the foundation for the concept of continuity in history. Many contemporary historians shun these labels and are consequently faced with two choices: giving up the concept of continuity altogether, or adopting it from the tradition of historiography and perhaps developing it in their own fashion. Historians at present are more aware than ever of the heuristic character of the concept of continuity; they see it merely as a 'regulative idea' in historical narration (Rüsen, 1982). Today, the focus is more on discontinuity. In this respect the impact of Foucault as an outright anti-Hegelian thinker (especially with his 1969 study *L'archéology du savoir*) is not to be underrated.

The dismissal of the concepts of continuity and totality has also had an impact on the writing of the novel. The idea of the 'self-contained' work of art that provides totality by way of typical characters is dead. Its place has been taken by the 'open' novel with its open-endedness, as first envisioned by the early German Romantics. In his *Theorie des Romans* (1916), Georg Lukács declared that the modern novelist could outdo the historiographer if, after the loss of totality of meaning and being, he or she would counter the partial insights into the course of history with concern for a new, homogeneous cosmology. In contrast, however, the modern novel plays an important role as an instrument of cognition because such concepts of systems are now distrusted. Not a new cosmology of being, but a view of the disparity of what is to be, of the diversity of possibilities, is what this medium can provide.

In twentieth-century philosophy, a similar discussion to the one between Plato and Aristotle about the truth value of fiction took place. Adorno was convinced that, due to its autonomy, art 'as a creative, nonalienated work' was the last vestige of freedom. According to him, art and literature alone can unveil what is hidden in reality and can destroy ideology and lies (Adorno, 1970). What Adorno criticized as a Web of ideological deceptions is close to what Roland Barthes calls the 'mythicizing' of everyday life. Like Adorno, Barthes affirms that poetic language maintains direct contact with reality and, unlike historiography, escapes mystification (Barthes, 1957). In contrast to Adorno and Barthes, Eagleton and Jameson argue that the writing of literature is just another form of ideological production (Eagleton, 1976). Jameson maintains the following position: "Ideology is not something which informs or invests symbolic production; rather the aesthetic act is itself ideological, and the production of aesthetic or narrative form is to be seen as an ideological act in its own right" (Jameson, 1981).

All four authors make extremely one-sided statements. The common ground of historiography and literature is narration. And when narration, through the eyes of Jameson, is seen as an ideological act per se, we cannot expect much truth in either historiography or fiction. But if, on the other hand, literature is able to destroy ideology and deception – to cite Adorno – this virtue should also be attributed to historiography. Narration can lead in both directions: it can help to approach truth or it can produce ideological veils. Neither literature nor historiography is immune to the virus of error or the distortion of truth, but both are capable of making reality be seen more clearly.

Meaning, Memory, and Identity

Among the functions of historiography and the novel are, along with the search for truth, the imparting of meaning and the provision of identity. The imparting of meaning (*Sinnbildung*) is far from the creation of meaning (*Sinnstiftung*) (Rüsen, 1982). Surely there were, and still are, historiographers and novelists who have declared themselves ideological creators of meaning, but neither modern novelists nor critical historiographers are interested in such ambitious goals. In historical narration, the imparting of meaning is achieved through memory alone. And although novelistic narration cannot be reduced to memory, it plays an important role here as well. This is especially evident when historians fail to bring to mind certain aspects of historical experience through memory; then it is often the novelist who must assume this task. The 1950s in West Germany provide a clear example of this phenomenon. With regard to the National Socialist past, repression rather than grief was prevalent. It was a novel that broke this taboo: *Die Blechtrommel*, by Günter Grass (1959). This literary breakthrough was fallowed by the works of the historiographers. George Steiner listed a number of examples of this function of the "writer as remembrancer" (Steiner, 1973). It is particularly in cases of the conscious falsification of history by historians that the writer steps in.

Writers and historiographers can help define the identity of a generation, a nation, or a culture. Since the Enlightenment and secularization, historiography and fiction have been burdened increasingly with the function of providing an identity. By dealing with memories, the experiences of the present attain a coherent perspective that provides the reader with an orientation for the future. Repeatedly correlating experiences of the present with those of the past can bring about the dissolution of stagnant patterns of identity, with a critical view of ideological prejudices (Lützeler, 1998). The factual orientation of the historiographer as well as the novelist's interest in what is possible are part of the provision of

identity. By means of memory, a potential of historical and literary meaning is activated that, along with the demonstration of actual limits and the allusion to yet untested possibilities, makes the provision of identity possible. Historical and literary consciousness is a complex construct in which memory is the prerequisite for interpretation and expectation. To structure an identity means, first, to identify with stories. During an identity crisis, society may show greater interest in historical remembering (as was the case in Europe in the nineteenth century), or demand a fictional provision of identity (as is presently the case in Latin America). The weaker the link with the historical past and the more suspect it appears, the stronger will be the desire for fictional patterns of identity.

Abstract

History and the social sciences have developed and maintained complex relationships made up of commonalities and differences as well as divergences and convergences. In principle, both disciplinary areas are concerned with the scientific study of the human life-world and the whole range of human behavior, individual and collective, in time and space as well as in the past and the present. Both disciplinary areas originated, with the rise of the modern world, as a common enterprise to develop systematic, secular, and empirically validated knowledge about the historical-social reality. In this fundamental sense, history can be and should be seen as part of the social sciences or vice versa the social sciences as part of the historical sciences – both constituted by substantially interrelated modes of sociohistorical research (Gulbenkian Commission, 1996; Hall, 1999).

History and the social sciences have developed and maintained complex relationships made up of commonalities and differences as well as divergences and convergences. In principle, both disciplinary areas are concerned with the scientific study of the human life-world and the whole range of human behavior, individual and collective, in time and space as well as in the past and the present. Both disciplinary areas originated with the rise of the modern world as a common enterprise to develop systematic, secular, and empirically validated knowledge about the historical-social reality. In this fundamental sense, history can be and should be seen as part of the social sciences or vice versa the social sciences as part of the historical sciences – both constituted by substantially interrelated modes of sociohistorical research (Gulbenkian Commission, 1996; Hall, 1999).

Despite their fundamental commonality, however, history and the social sciences have followed quite different and diverging epistemological and methodological tracks during their academic institutionalization in Western Europe and North America in the nineteenth and early twentieth centuries. On the one hand, the social sciences (economics, sociology, and political science as well as anthropology) came to be oriented toward the successful epistemological model of the natural sciences and defined themselves primarily as nomothetic and generalizing disciplines. On the other, history, predominantly influenced by the humanities and critical against speculative social laws, developed traits of an idiographic and particularistic discipline. Against these traditional disciplinary definitions, a converging interdisciplinary cooperation between history and the social sciences has developed only in the second half of the twentieth century. The social-scientific orientation of history was programmatically formulated in approaches such as the 'new social history,' 'la nouvelle histoire,' 'Social Science History,' or 'Historische Sozialwissenschaft,' developing in leading journals such as *Annales Economies, Sociétés, Civilisations* (1946), *Past and Present* (1952), *Journal of Social History* (1967), *Journal of Interdisciplinary History* (1970), *Social Science History* (1976), and *Geschichte und Gesellschaft* (1975). In a parallel movement, the historical orientation of the social sciences crystallized in new areas like historical sociology, historical economics, historical political science, and historical anthropology. Sometimes even the epistemological identity of history and the social sciences has been stated in a fundamental sense.

More recently, however, this *rapprochement* between history and the social sciences was halted and partly reversed. Within the study and presentation of history a 'revival of the narrative,' a 'new cultural history,' and concepts of the 'historical cultural sciences' have emerged, emphasizing what distinguishes them from the social sciences proper. But it should be stressed that, in a parallel movement, the social sciences have been similarly challenged from within by alternative cultural, interpretative-hermeneutic, and deconstructive-postmodernist epistemologies. Often the so-called 'cultural turn' in history and the social sciences is seen as a replay of the traditional juxtaposition of idiographic and nomothetic positions and conservatively used to reconfirm the traditionally separate institutionalization of both disciplinary areas. But properly understood, this cultural turn can and should be rather viewed as a challenge to the still prevailing principled opposition of generalizing or particularizing disciplinary epistemologies and methodologies. The future task, then, would be to open the historical and social sciences toward a common and multivocal, intra- and interdisciplinary discourse of sociohistorical inquiry.

Disciplinary Divergence

In its originally institutionalized – but nowadays increasingly challenged – meaning, history is primarily concerned with the study, description, interpretation, and presentation of historical facts or relics from the past, focusing on: idiographic methods, the analysis of historical contexts and temporal change, and the conceptualization of historical phenomena as particular individualities, their inductive interpretation, and narrative presentation (Burke, 1992; Zunz, 1985). In the opposite – but also increasingly questioned – direction, the social sciences such as sociology, economics, political science, and anthropology have been traditionally understood as concerned with the study, generation, and explanation of social facts in the present emphasizing nomothetic methods,

systematic analysis, and theoretical explanation by reference to general laws or social regularities (Monkkonen, 1994; Skocpol, 1984).

This problematically polarizing division between history and the social sciences developed with the institutionalization of the university systems during the nineteenth century under the impact of the natural sciences. Science, since then, came to be equated primarily with the natural sciences and particularly with its conspicuous inorganic and organic branches of physics and biology. Taking the natural sciences as epistemological models, the social sciences emerged as an attempt to discover the general laws and evolutionary mechanisms of modern society (Lepenies, 1988; Gulbenkian Commission, 1996). Thus, political or classical economy as developed by Adam Smith or David Ricardo tried to find the general laws of modern capitalist market society or in a critical direction as formulated by Karl Marx to uncover the anatomy of emerging modern capitalism. In the same steps, the early founding fathers of sociology such as Claude-Henri Saint-Simon, Auguste Comte, or Herbert Spencer intended to find the structural and evolutionary laws of modern society. At the same time, with the advent of modern mass politics in the American and French revolutions, the emerging political science as in Alexis de Tocqueville or John Stuart Mill attempted to formulate the general features and bases of modern democratic polities. Finally, with the growing awareness of non-Western societies under the impact of European colonialism and imperialism, anthropology tried to analyze the archaic or 'primitive' societies as structural counterparts and evolutionary prestages of modern society.

By contrast, history in view of the contingent flow of historical events and human actions as well as the role of cultural and spiritual forces came to be skeptical of the search for quasi-natural laws of the historical-social world. Instead, history followed the humanities, art, and literature as culturally oriented disciplines that seemed to be closer to the spiritual, creative, and poetic aspects of historical development. Particularly under the impact of German 'historicism,' the epistemological and methodological principles of historical knowledge developed into a radical opposition to the positivist search for historical-social facts. The principle of Leopold von Ranke to narrate history 'wie sie eigentlich gewesen ist' formulated the conviction that the historical method has to grasp the historical reality in its manifold particularities. In epistemological terms as developed by Johann Gustav Droysen and Wilhelm Dilthey, history cannot be subsumed under deterministic-mechanistic laws, but has to be understood in its concrete, experience-near, and life-full quality. On this basis, not only were the historical subdisciplines such as political, legal, cultural, social, and economic history principally viewed as hermeneutic-interpretative disciplines, but also economics, sociology, and political science as promoted among others by Gustav Schmoller, Werner Sombart, or Max Weber were primarily conceptualized as cultural sciences rather than as social sciences in order to grasp the individual and collective meanings structuring socioeconomic and political actions and processes. These epistemological and methodological differences and divergences were characteristic for the relationships of history and the social sciences not only in Germany, but also in all Western societies. However, through the particular influence of German 'historicism' refuting on ontological grounds the applicability of explanatory social-scientific methods to historical events and cultural individualities, these divergences often developed into a principled opposition (Iggers, 1993; Lepenies, 1988).

The interdisciplinary bridging of this epistemological, analytical, and methodological opposition only became possible with the increasingly historical orientation of the social sciences as well as the growing social-scientific and sociological orientation of history (Abrams, 1982; Lipset and Hofstadter, 1970; Skocpol, 1984). In the first half of the twentieth century, this converging movement was seldom although of crucial significance in preparing the ground for the later developing convergences between the historical and social sciences. Of lasting influence was, first, Emile Durkheim and the continuation of his approach by Marcel Mauss and Henri Berr, attempting to combine the sociology of social change with anthropological comparisons and historical developments (Raphael, 1994; Stoianovich, 1976). Of fundamental importance was also, second, the German historical-comparative sociology, particularly in the hands of Max Weber, Otto Hintze, Werner Sombart, and in their continuity also of Norbert Elias, who tried to explain the specificities of the Western civilization, its unique economic, political, and cultural order by historical and universal comparisons (Lepenies, 1988). Third, strongly influenced by European sociological traditions, modernization theory developed in the United States as a universal social-scientific approach closely connected with historical-comparative modernization research on the historical prerequisites and developments of modern societies on a world scale.

Interdisciplinary Convergence

Influenced by these precursors, the historical and social sciences combined programmatically, first in the Annales school (Raphael, 1994; Stoianovich, 1976) and then later in the American Social Science History approach (Tilly, 1981), some proponents of English Marxist historiography (Kaye, 1984) and in their emulation in the West German 'Historische Sozialwissenschaft' (Kocka, 1977; Wehler, 1980). This interdisciplinary convergence led to different forms of 'social-scientific history' or 'historical social science' – despite many national particularities. They materialized in the 1960s and 1970s in a parallel movement in the Western societies (Iggers, 1993). In critical opposition to the received tradition of narrative and exclusively interpretive history, the major common methodological aims of social-scientific history or historical social science can be summarized in the following principles. First, social-scientific historical approaches should be oriented to a structural and processual perspective on the various (economic, sociopolitical, and cultural) dimensions of macrohistorical change. Second, they should shift historical analysis from a 'top-down' elite perspective to a 'bottom-up' popular or people's history. Third, social-scientific historical approaches should give up the traditional emphasis on political and intellectual history and turn toward economic and social history. Fourth, they should make systematic use of the available social-scientific, theoretical, comparative, and

quantitative methods in history and favor systematic explanation instead of hermeneutic interpretation. Finally, this movement to social-scientific history or historical social science was often motivated by a critique of traditional elitist-conservative historiography and a commitment to emancipatory, democratic, or enlightened values.

The common methodological aims of social-scientific history or historical social science, at the same time, were colored and refracted by the respective national intellectual and cultural environments. In France, the 'nouvelle histoire' promoted within the long established interdisciplinary tradition of the Annales school (Raphael, 1994; Stoianovich, 1976) was characterized by a rather balanced multilevel (*longue durée, conjonctures, évènements*) and multidimensional (economy, social structure, and civilizational mentalities) mode of historical analysis. In England, a strong neo-Marxist influence shaped the rise of economic and social history with a particular emphasis on social inequality and class history (Kaye, 1984). In the United States the interdisciplinary social science history was influenced by the development of historical-comparative multidimensional modernization research and the special attraction of econometric, statistical, and social research methods for the quantification of historical processes (Tilly, 1981). In Germany, Marxian and Weberian traditions of scholarship combined with elements of Western modernization theories and led to 'Historische Sozialwissenschaft' and 'Gesellschaftsgeschichte,' in which the analysis of social inequality and political power with a particular emphasis on the German 'special path' were treated (Kocka, 1977; Wehler, 1980). At the same time, these national variations reflect not only differing intellectual and theoretical traditions, but also a different emphasis on the use of qualitative and quantitative methods in historical-social inquiry. This is also indicated by the paradigmatic oscillations between the concepts of (1) historical social science, (2) structural history, and (3) social-scientific history.

'Historical social science' ('Historische Sozialwissenschaft') serves as a loosely defined summary category. Still, the historical-comparative analysis of large-scale and multidimensional processes of social change from traditional life-worlds to modern society has been at the center. In particular, the concepts of historical-comparative modernization research, historical sociology, societal history, and synthetic structural history, with different theoretical and methodological orientations, belong to this category. In the French Annales school in a mixture of Durkheimian and Marxian traditions, the comparative analysis of feudalism by Marc Bloch and the social history of capitalism by Fernand Braudel (to be followed by Immanuel Wallerstein's history of the modern world system) are important examples. Among English Marxist historians, the debate on the transition from feudalism to capitalism in a line from Maurice Dobb to Perry Anderson and the social history of modern classes, developed in different directions by Eric Hobsbawm and Edward Thompson, carried the field. In the United States, modernization research guided by a mixture of Max Weber's comparative sociology and Talcott Parsons' structural functionalist theory of social change was of major importance, resulting in path-breaking studies like Neil Smelser's analysis of social change in the English industrial revolution; Shmuel Eisenstadt's civilizational comparison of empires; Barrington Moore's historical explanation of the development of twentieth-century dictatorship and democracy; Tilly's edited volume on the formation of national states in Western Europe; and Reinhard Bendix's study on corresponding historical changes in the legitimacy of political domination (see as an overview Skocpol, 1984). In Germany, the modernization paradigm in a mixture of Weber and Marx directed Ralf Dahrendorf's sociological analysis of Germany's troublesome process of democratization or Hans-Ulrich Wehler's (1987–95) and Jürgen Kocka's (1993) comparative social-historical investigations of the German 'special path' and the role of the social classes within it.

'Structural history,' again, has had different meanings with different outlooks. It materialized in innovative areas of a variety of 'new histories' along the lines between the main subsystems of modern society and the related social-scientific disciplines. In the 'New Economic History' of the 1960s, the application of economic concepts and theories has given rise to the history of economic growth, technology, capitalist markets, and institutions; here, David Landes' (1969) *Prometheus* or Sidney Pollard's (1981) *Peaceful Conquest* are examples of a qualitative type, whereas Gianni Tonioli's (1991) comparative history of European industrialization – debating Alexander Gerschenkron's theory of economic backwardness – represents a quantitative type of economic history. In the 'New Social History' in the 1960s and 1970s, sociological concepts were used in the historical analysis of demographic development, social structure, and social mobility; social groups, occupational structures, and social classes; social institutions, associations, and interest groups; as well as social movements, social protest, and political mobilization (Kocka, 1977). This was combined with the application of political-scientific approaches to the history of political modernization, state formation, nation building, the development of democratic regimes and party systems, as well as political power and contestation (Tilly, 1984). Further, social-scientific approaches influenced by social anthropology have also been applied to cultural phenomena and developments such as family and socialization, religion and secularization, as well as value systems and mental structures (see different essays in Rürup, 1977).

The concept of 'social-scientific history' has been used primarily for the application of rigorous quantitative research methods in structural or social history (Landes and Tilly, 1971; Schröder, 1994). Not always, but often it has been equated with historical social research or the systematic quantitative operationalization and measurement of historical-social variables. In addition, this often combined with a deductive application of theoretical models to historical data and their explanation through statistical-mathematical and increasingly computer-assisted methods. Also this type of social-scientific historical research followed, either in close cooperation or in separate organization, the main areas of the 'new histories.' Particularly, the 'New Economic History' has been suited to cliometric, statistical, and econometric research methods as for instance in Paul Bairoch's and Maurice Lévy-Leboyer's (1981) analysis of economic growth disparities since the industrial revolution. But also in the new social history, social-demographic family, mobility, and migration studies such as Richard Wall et al. (1983) as well as time series of social protest

such as Charles Tilly et al. (1975) are prominent examples. In the new political history, the historical change of voting behavior, in particular, became an important field of historical social research (e.g., Best and Thome, 1991). But also in the cultural history of mentalities as carried through particularly in the Annales tradition, the application of quantitative methods were fruitfully developed (e.g., Shapiro and Markoff, 1998).

Interdisciplinary Challenges

Successful as these different new historical subdisciplines in their qualitative and quantitative orientations have been, the guiding vision of social-scientific approaches to history has been the combination of the various structural histories in a unifying societal history, 'histoire totale' or 'Gesellschaftsgeschichte' (Iggers, 1993; Wehler, 1980). This vision follows the epistemological ideal of merging the historical sciences and the social sciences in a common paradigm – as essentially expressed in the paradigmatic concepts of social science history, historical sociology, or 'historische Sozialwissenschaft' (Abrams, 1982; Smith, 1991; Wehler, 1980). With this unifying vision, however, the disciplinary traditions and methodological differences between historicized conceptions of the social sciences and social-scientific approaches to history become easily blurred. On the one hand, historical approaches in the social sciences basically proceed within a generalizing frame of reference (Monkkonen, 1994). For instance, historical economics follows the basic idea of uncovering time/space bound economic laws or regularities (Kindleberger, 1990; Monkkonen, 1994; Wallerstein, 2000). Also historical sociology is primarily oriented to the general features of time/space bound social processes, patterns, and figurations (as exemplary studies see Eisenstadt, 1996; Mann, 1986/1993, Smelser, 1991). In parallel, historical approaches in the political sciences concentrate on general features of political development (Monkkonen, 1994). Also, historicized versions of anthropology are interested in the general evolutionary patterns of human behavior (Monkkonen, 1994). On the other hand, social-scientific approaches to history as multidimensional structural or combined societal history usually remain in the confines of a narrative frame of reference – even when applying rigorously social-scientific theoretical concepts and research methods. Thus, in spite of all interdisciplinary convergence, there have been limits to a full merger between historically oriented social science and social science oriented history.

A second *problematique*, expressed in the oscillating meanings of historical social science, structural history, and social-scientific history, concerns the relationships between theory and method. Structural approaches to history often use social-scientific concepts in order to systematize, interpret, and explain long-term historical processes in one or another societal dimension. Social-scientific approaches to history are often oriented to theoretical models in order to explain deductively quantified historical-developmental data. Approaches in historical social science and related synthetic orientations to history often use multidimensional theories of social change in order to explain causal connections between the various societal dimensions. Many varieties of historical social science, structural history, and social-scientific history use theories and concepts, deductive and inductive modes of explanation or interpretation, as well as qualitative, quantitative, and comparative methods of analysis. In an effort to systematize these methodological strategies in historical-social inquiry, Theda Skocpol proposed to distinguish model-theoretical, causal-analytical, and interpretive modes of explanation (Skocpol, 1984: pp. 356–391). Charles Tilly, concentrating on the types of comparison and the number of cases and variables involved, differentiated between individualizing, generalizing, encompassing, and variation-finding forms of comparison (Tilly, 1984: p. 84ff). Charles Ragin (2000), attempting to bridge qualitative and quantitative modes of analysis, distinguished between case-analytical and variation-oriented methodological strategies. Fruitful as these methodological distinctions are, particularly the methodological relationships between explanatory and interpretive research strategies, the theoretical sources and analytical consequences of these methodological distinctions for sociohistorical inquiry still remain unexplored (Hall, 1999: p. 173).

A third increasingly salient but divisive *problematique* concerns the role of culture in the differing modes of historical social science, structural history, and social-scientific history. Not only in practice, but also often programmatically, social-scientific approaches to sociohistorical inquiry tend to favor the analysis of the economic, social, and political dimensions and to limit the analysis of culture to value systems or cultural institutions. The contents and forms of culture in their constitutive or causal role in history are often neglected and the corresponding hermeneutic or deconstructive methods to interpret their meanings, symbols, values, and identities are often seen as secondary. Against these prevailing tendencies of social-scientific approaches to culture, there emerged an increasingly influential challenge by the 'new cultural history' or cultural-scientific versions of history (Hunt, 1989; Dirks et al., 1994; Mergel and Welskopp, 1997). This 'cultural turn' consists of different countercurrents against the social-scientific vision of a systematic, generalizing, and explanatory structural and societal history. First, the revival of the narrative insists on the interpretive, literary, and narrative tasks of history (Stone, 1979). Second, the development of microhistory or 'Alltagsgeschichte' emphasizes the complexity of life-worlds as such or as microfoundations of historical macrostructures (Luedtke, 1989). Third, the 'linguistic turn' presupposes the all-pervasiveness of language in the social world, thus stressing the analytical task of deconstructing discourses and decoding linguistic-symbolic structures (Hunt, 1989). Fourth, the 'cultural turn' is consciously oriented to those social groups such as women, ethnic minorities, or the underclass, seen as neglected by the predominating social-scientific approaches to history (e.g., *History Workshop Journal* 1976 or *Radical History* 1975). Finally, some authors are influenced by a postmodernist perspective emphasizing the fragmentation and decentering against the structuring and ordering of the social world (Iggers, 1993). The result is not only the generation of a whole new set of historical subdisciplines such as women's and gender history, ethnic and minority history, regional and local history as well as the history of identities and memory, but also an influential shift from social-scientific history to cultural-scientific history (see however Bonnell and Hunt, 1999).

In a sense, the 'cultural turn' signifies a revitalization of historicism and cultural-scientific approaches to history – reemphasizing qualitative, interpretative, ethnographical, and hermeneutic methods against systematic-explanatory orientations and, with it, reversing the causal or structural determination of history from 'society' to 'culture.' At the same time, this theoretical and analytical movement reflects a parallel shift in the social sciences from social-structural to institutional and cultural paradigms (Skinner, 1985; Matthes, 1992; McDonald, 1996). For instance, in economics and economic sociology the new institutionalism has gained wide recognition, but also cultural neo-Weberian approaches reappear (North, 1981; Monkkonen, 1994; Swedberg, 1998). In various domains of sociology as well, the 'new institutionalism' and various forms of a 'new cultural sociology' become influential (Monkkonen, 1994; Crane, 1994). Further, in political science the traditional institutional approaches become challenged by cultural paradigms (Monkkonen, 1994). All this is influenced by a crucial shift in anthropology from social and structural anthropology to various forms of interpretative, ethnographic, historical, and cultural anthropology (Monkkonen, 1994). As a result, social-scientific history is not merely confronted with systematic, generalizing, and explanatory forms of the social sciences, but also with individualizing, interpretative, and reflexive varieties of the cultural sciences. In other words, new opportunities of interdisciplinary cooperation emerge.

Interdisciplinary Perspectives

The interdisciplinary cooperation and convergence of history and the social sciences have opened up novel and dynamical fields of sociohistorical research. At the same time, the *idées directrices* of that historical-social-scientific convergence have often privileged quasi-natural-scientific epistemologies and methodologies. As a consequence, generalizing modes of sociohistorical inquiry stand in tension with particularizing modes; structural and macroanalytical theories used in historical-social analysis conflict with action and microanalytical theories; causal explanation is often limited to the application of theoretical models and causal-analytic methodologies in opposition to interpretation and hermeneutic strategies; and, accordingly, there are tensions between qualitative and quantitative methods, including generalizing and particularizing methods of comparison. These tensions are revealed, on the one hand, within the social-scientific convergence of history and the social sciences in the paradigmatic oscillations between the guiding concepts of historical social science, structural history, and social-scientific history. These tensions develop, on the other hand, within the wider historical sciences, in the often polarized opposition to renewed historicist and culturalist, narrative and hermeneutic or deconstructivist modes of historical-social inquiry. At the same time, these theoretical and methodological oppositions and polarizations are not solely characteristic for the historical sciences. Parallel disciplinary developments can also be observed in the social sciences and the widespread and often sharp oppositions to cultural-scientific approaches in the various social-scientific disciplines.

These epistemological, theoretical, and methodological oppositions and conflicts have often led into a stalemate in both disciplinary areas of the historical and social sciences between renewed forms of narrative-interpretative and anthropological-cultural history in contradistinction to the nomothetic social sciences. However, these oppositions in the historical as well as the social sciences can and should be used to reenergize a wider intra- and interdisciplinary cooperation between the historical, social, and cultural sciences. These renewed cooperative efforts should concentrate on the crucial epistemological, theoretical, methodological, and analytical dimensions in sociohistorical inquiry within and across the established academic disciplines: on the epistemological level, combining social-scientific and cultural-scientific as well as generalizing and particularizing modes of knowledge; on the theoretical level confronting systematically social-structural and cultural approaches to historical-social reality; on the analytical level, mediating between the social-structural, institutional and cultural dimensions as well as between the global, national, regional, and local macro-/microdimensions in sociohistorical inquiry; and on the methodological level, clarifying the relationships between qualitative and qualitative as well as historical, social-scientific, and cultural-scientific comparative research strategies (Bourdieu, 1995; Haupt and Kocka, 1996; Spohn, 1998). All these renewed epistemological, theoretical, methodological, and analytical efforts of an inter- and intradisciplinary cooperation should not be done in segmented isolation, but in a multidisciplinary and multivoiced context of practiced sociohistorical inquiry. Such an opening of the historical and social sciences, however, is not only a matter of an intellectual intra- and interdisciplinary cooperation, but also demands an institutional cross-cutting between and across the segmented academic disciplines of the historical and social sciences (Gulbenkian Commission, 1996).

History from Below, the History of Everyday Life, and Microhistory

Andrew I Port, Wayne State University, Detroit, MI, USA

Abstract

'People's history' focuses on the lives of ordinary people, with an eye to their struggles, everyday practices, beliefs, values, and mentalities. Influenced by the *Annales* School and cultural anthropology, but reacting against traditional social history's emphasis on social structures and serial trends, its practitioners emphasize the importance of individual agency while trying to demonstrate the complexity of lived experience, the fluidity of identity, and the subjective nature of meaning. Important types of 'people's history' include 'history from below,' *Alltagsgeschichte* (the 'history of everyday life'), and 'microhistory,' all of which involve a dramatic reduction of historical scale, focusing on a single individual, community, or spectacular event.

The Origins, Characteristics, and Goals of 'People's History'

'People's history' marks a radical departure from traditional mainstream historiography, which long tended to concentrate on high-level politics and diplomacy, warfare, and the lives of great statesmen. The move away from this focus on the high and mighty began most systematically during the period between the two world wars. Trying to understand social dynamics and the ways in which societies change, the members of the French *Annales* School embraced an interdisciplinary, materialist approach that looked to the social sciences for inspiration. At the same time, they shifted their attention away from major events and powerful individuals to underlying structural forces, mentalities, and the masses. Similar concerns and methods inspired a group of Marxist historians active in the United Kingdom after World War II, as well as a number of historians working later in the United States. Turning their attention to the lives and struggles of ordinary people, they focused on social relations at the grass roots, popular forms of protest, everyday activities such as work and leisure, as well as attitudes, beliefs, practices, and behavior. This became known in the 1960s as 'history from below.'

It was out of this tradition, which significantly broadened the array of 'legitimate' topics considered worthy of historiographical investigation, that new variations of 'people's history' – *Alltagsgeschichte* ('the history of everyday life') in Germany, 'microhistory' in Italy and France – emerged in the 1970s and 1980s. Despite some differences in their method and use of sources, the two share a number of essential characteristics. In the first place, their practitioners focus on the qualitative, quotidian, 'lived' experiences of ordinary people, i.e., on the actions, practices, habits, values, beliefs, mentalities, and feelings of the oppressed, excluded, pauperized, and marginalized: those who have traditionally been excluded from historical accounts and remained "largely anonymous in history – the 'nameless' multitudes in their workaday trials and tribulations" (Lüdtke, 1995: 4).

To that end, they dramatically reduce the scale of their historical investigation, confining it to a single individual, small community, or seemingly obscure event which is then subject to painstaking microscopic analysis involving an intensive study of the available documentary material. Immersing themselves like detectives in seemingly mundane sources related to themes such as everyday family life, gender relations, leisure activities, and popular culture, they search for and try to tease out the meaning of 'various clues, signs, and symptoms' – all in the belief that 'microscopic observation' will uncover and explain the 'previously unobserved,' as well as other revealing phenomena lost to the type of 'conventional analysis' that takes a more comprehensive bird's-eye view (Levi, 1991: 97, 106; Brewer, 2010: 97; Muir, 1991: xvi–xvii). The focus on spectacular stories and obscure people are, in short, 'devices' to get at larger issues (Lepore, 2001: 144) – while the 'lingering' over mere details represents an innovative attempt to achieve "the old dream of a total history, but this time reconstructed from the bottom up" (Steege et al., 2008: 375; Revel, 1995: 497).

Such histories usually fall into one of two categories: the 'episodic' and the 'systematic' (Gregory, 1999: 102). The first type, which tends to take a narrative approach and rely heavily on 'thick description,' focuses on a single, spectacular episode or event usually involving one person or a small group of individuals – such as the investigation of a heretical sixteenth-century Italian miller by Inquisition officials (Ginzburg, 1980), the elaborately staged murder of dozens of cats by disgruntled apprentice printers in Paris in the 1730s (Darnton, 1984), or an antisemitic riot incited by accusations of blood libel in a small Prussian town in the early twentieth century (Smith, 2002). The other type assiduously reconstructs the complex web of familial and extrafamilial social relations in a small community. Prominent examples include Giovanni Levi's study of social interaction in a village in the Piedmont in the 1690s – "a banal place and an undistinguished story," in the words of the author (Levi, 1988) – and David Sabean's dense studies of property, production, and kinship in the southern German village Neckarhausen from 1700 to 1870 (Sabean, 1990, 1998).

The goals and value of such studies are manifold. In the first place, they are at pains to demonstrate the ways in which ordinary people had agency and were not merely the victims of large, amorphous, impersonal forces, i.e., that they were the active subjects of their own lives – not just the passive objects of 'history.' A great deal of attention is thus paid to their ability to withstand hegemonic forms of dominance and control, i.e., to "an individual's constant negotiation, manipulation, choices and decisions in the face of a normative reality which,

though pervasive, nevertheless offers many possibilities for personal interpretations and freedoms" (Levi, 1991: 94). This focus on obscure individuals and the 'business of coping' (Bucur et al., 2009: 206) is also important because it vividly reveals the multiplicity and extreme complexity of lived experience, especially its more subjective dimensions in 'concrete life situations.' Such close-up investigations – which combine the "warmth of the narrator's intimate glance and the coldness of the scientist's detached observation" (Ginzburg, 1993: 16) – lay bare the 'social production and construction of meaning' by individuals themselves in ways that can 'hold up against the ruling discourses of a particular society,' the 'ambiguities and contradictions' of perceptions and behavior, as well as the way in which 'power relations are reproduced and challenged in everyday exchanges' (Eley, 1989: 315, 322–323; Bucur et al., 2009: 195–196).

The Role of Agency and the Reaction against Structures, Serials, and Teleologies

'People's history' in all its forms traces its intellectual heritage to *Annales*, but it is at the same time a conscious reaction against the work of that school, as well as against the type of interdisciplinary 'social science' history it inspired in France, the United States, and Germany beginning in the 1950s and 1960s. The latter, as practiced by leading historians such as Fernand Braudel in France and later Hans-Ulrich Wehler in Germany, relied heavily on sociological theories and techniques, focusing on aggregate trends and numerical series (e.g., births, marriages, deaths, prices, occupations) in an attempt to uncover long-term, large-scale, measurable regularities, formulate historical 'laws,' and arrive at blanket generalizations about human behavior (Revel, 1995; Eley, 2005).

Those who became disillusioned with this quantitative approach launched a multipronged critique. They objected, in the first place, to the way it seemingly crushed "all individuals to insignificance under the weight of vast impersonal structures and forces" (Muir, 1991: xxi) and thus failed to take into account the agency of ordinary people. Instead of consigning the so-called masses to historical impotence, history 'from below' tries to show how they themselves contribute to, appropriate, and shape broad supraindividual forces and structures. They see historical change and continuity, in other words, as the result of actions by groups and individuals who are '*simultaneously* both objects of history and its subjects' (Lüdtke, 1995: 6–8).

In a sense, the way in which they problematize the relationship between agency and the iron cage of structure is reminiscent of studies by so-called new cultural historians, who question Marxist claims about the primacy of the 'material' and the 'social' in the complicated relationship between base and superstructure (Hunt, 1989). That said, historians of everyday life and mirohistorians have been just as critical of postmodernism, which the new cultural historians have strongly embraced, as they have been of structuralism. Whereas the latter seemingly erased the role of individuals, the former has tried to 'kill off the subject completely' (Steege et al., 2008: 377) and thus call into question all claims about human agency.

Those who practice various types of 'people's history' also question the seemingly uniform, homogeneous way in which social science history has portrayed social life across different societies, as well as within any single society. They point instead to the great variety and complexity of social relations, experiences, behavior, and identities at the grass roots. This, they claim, is something that a focus on aggregate trends, large-scale processes, as well as overarching categories and groups (such as 'workers') is, by its very nature, unable to grasp. They draw attention to other supposed weaknesses of social science history as well: its reliance, for example, on documents – usually produced by those in positions of power – containing material that can be serialized. What about documents and documented practices, they ask, that do not readily lend themselves to quantification, or those that are 'documentarily unique' – what François Furet has suggestively referred to as the *hapax legomenon* (Ginzburg, 1993: 21). The claim here is that seemingly unique events and actions, as well as single cases or episodes, that violate norms can, in fact, illustrate underlying social structures, behaviors, and practices that would otherwise remain undetected.

Besides criticizing the methodological shortcomings of quantitative social science history and its 'macro' approach, which is seen as too deterministic and mechanistic, the practitioners of 'people's history' have also strenuously objected to the way it embraces grand narratives of progress – above all those associated with 'modernization theory' and its "single, linear progressive model…against which all societies are measured." The gold standard of development has been Western affluence and the triumph of modern consumer society (Brewer, 2010: 93–94). By turning their attention to the ways in which the 'losers' of history and the 'casualties of progress' experienced modernity in all its facets, as well as to 'fragmentation, contradictions, and plurality of viewpoints,' microhistorians and historians of the everyday look at social strategies and 'concrete experiences' that buck general trends – and thus fail to accord with the 'grand contours' of history identified by those who take a more capacious view of historical developments. This allows them to emphasize the importance of contingency and uncover, furthermore, the "social context in which an apparently anomalous or insignificant fact assumes meaning," thus revealing "the hidden incoherences of an apparently unified social system" (Levi, 1991: 107; Lüdtke, 1995: ix, 7).

Political Sensibilities and Intellectual Influences

The foregoing suggests the political agenda of everyday history and microhistory, whose practitioners – while highly critical of Marxist structural history – share Marxist critiques of "liberal conceptions of modernity" and the steamroller effects of capitalism, industrialization, and bureaucracy on the downtrodden (Gregory, 1999: 101). Coming from a leftist background, their political sensibilities were (re)formed in the crucible of the 1970s, a period of political inertia and economic stagnation that not only marked the end of the *trentes glorieuses* in the West, but also called into question – following the turbulence of the late 1960s – Marxism's 'scientific' premises and promises about the progressive nature

and emancipatory power of the industrial proletariat (Bell, 2002). It was in this atmosphere, characterized by a 'new reticence' about progress and modernity, that a certain nostalgia for the preindustrial past flourished. In fact, this backward-looking 'romantic opposition to capitalism' and late modernity helps explain why so many pioneering microhistorical studies have looked at communities and mentalities during the early modern period (Ginzburg, 1993: 20).

The critique of Western ethnocentrism that accompanied this rejection of modernist teleology reflects the strong influence that cultural anthropology has had on the field of everyday history. In fact, its practitioners self-consciously adopt a variety of ethnographic methods and insights, such as Franz Boas and Claude Lévi-Strauss's ideas about 'cultural relativism,' as well as concepts such as Clifford Geertz's "thick description," which emphasizes the importance of social context, signs, and symbolism in understanding the cultural meaning of human behavior and practices. Like ethnographers, they try, by way of written documents and other sources, to immerse themselves in the daily lives of those they study, with an eye to uncovering routine and repetitive acts that, they believe, reveal the dominant and underlying forms of a given culture. These are then 'decoded' or read like any 'text,' be it written or spoken, gestured or performed (Highmore, 2002b; Rosenhaft, 1987).

As the practitioners of microhistory and the history of everyday life have pointed out themselves, there are a number of other pan-European influences on their work – from the literary practices of Leo Tolstoy in *War and Peace* to modernist authors such as Marcel Proust and Italo Calvino, from Siegfried Kracauer's ideas about cinema and the supposedly discontinuous nature of reality to 'neorealist' Italian film. Other discernible influences include sociologist Erving Goffman's theories about the performative aspects of everyday interactions, Pierre Bourdieu's 'theory of practical action,' Henri Lefebvre's evocative work on 'everyday life in the modern world,' as well as Michel de Certeau's ruminations on 'social practices' and the 'reappropriation' of cultural objects in resistance to the rhythms and demands of consumerist modernity. Michel Foucault's work on persecution, madness, and the oppressive nature of modern institutions, as well as Sigmund Freud's attention to language and the way in which 'trifles,' 'slips,' and other 'insignificant details' can alert us to hidden meanings, have been important as well (Levi, 1991; Brewer, 2010; Muir, 1991; Highmore, 2002b).

Among historians the greatest influence has undoubtedly been E.P. Thompson, the doyen of self-critical Marxist historians associated with the British New Left. His pioneering work *The Making of the English Working Class* effectively launched 'history from below' in the 1960s, with its emphasis on consciousness, culture, and the everyday conditions and practices of those obscure individuals he hoped "to rescue…from the enormous condescension of posterity." Equally important were Thompson's ideas about crowd rationality and the central role of experience in identity formation (Thompson, 1963, 1971; Eley, 1989: 313). 'History from below' subsequently flourished in the United Kingdom and the United States, but it was in Italy and Germany that it assumed radical new forms. The main practitioners in Italy were active in the northern part of the country, which, as a whole, did not have a strong social history tradition. Carlo Ginzburg, Giovanno Levi, and other Italian 'microhistorians' coalesced around the Bolognese journal *Quaderni storici*, which began publishing specimens of the new genre in the late 1970s. Along with Lutz Niethammer, Göttingen historians Alf Lüdtke and Hans Medick established the practice of *Alltagsgeschichte* north of the Alps in Germany, where they published much of their own innovative work, as well as that of their colleagues, in the journal *Historische Anthropologie*. Though they share comparable concerns and reflect similar influences, *Alltagsgeschichte* and microhistory are not entirely the same undertaking. Whereas the latter gravitates toward the spectacular and 'unique' in order to get at lived experience itself, the former focuses on largely unconscious, routine, and repetitive acts in an attempt to reconstruct social relationships and daily transactions – which, they believe, are themselves the key to understanding historical development (Gregory, 1999: 103–104).

There are no American or French 'schools' strictly speaking, but Natalie Zemon Davis, Robert Darnton, and a number of other scholars in the United States produced a series of path-breaking studies that belong to this field – as did the French historian Emmanuel Le Roy Ladurie, whose reconstruction of social life in a medieval village became a model of the genre (Le Roy Ladurie, 1978).

Critiques of Microhistory and *Alltagsgeschichte*

In their classic studies *Montaillou* and *The Cheese and the Worms*, Le Roy Ladurie and Carlo Ginzburg both relied heavily on detailed interrogations of alleged heretics conducted by members of the Inquisition in France and Italy. Reading these sources against the grain, they picked out banal details and documentary fragments to get at larger historical issues as well as at more general socioeconomic and cultural patterns – such as the complex relationship between elite and popular culture. Since the focus is on those who, as a rule, left behind few written documents themselves, other important sources have included reports by police and church officials, teachers, physicians, and factory inspectors; personal correspondence and travelogues; parish registers, wills, notarial records, and protocols.

The often ingenious use of seemingly mundane source material has been widely praised by other scholars. But this reliance on documents left by the rich and powerful to get at the lives of the poor and oppressed has also been a source of hefty criticism. For instance, many of these documents, such as legal ones used in court cases, were designed to deceive and distort reality in ways that some historians have supposedly failed to grasp (Kuehn, 1989). The need for careful – and the possibility of sloppy – source critique is not peculiar to microhistory and the history of everyday life, of course. Still, its practitioners – especially microhistorians – have been especially sensitive to the potential dangers of using documents originally intended to convey information that is much different from the focus of their own scholarly pursuits. This is why many have consciously integrated their

research procedures and source analysis into the narrative itself. As Ginzburg and Levi explain, the 'obstacles interfering with the research,' such as 'lacunae or misrepresentations in the sources,' were 'constituent elements of the documentation' and thus became an 'intrinsic part of the account.' Similarly, the 'hypotheses, the doubts, the uncertainties,' as well as the researcher's very procedure and point of view are all included in the narration (Ginzburg, 1993: 22–23, 28; Levi, 1991: 106). By 'revealing their bag of tricks,' they create a sort of Brechtian 'estrangement' effect that 'defamiliarizes' or 'denaturalizes' the seemingly familiar and thus offers an especially fitting form for depicting the complexity of the everyday (Highmore, 2002b: 21–23).

Another weighty critique concerns the possibility that these historians will interpret sources, persons, and events in an anachronistic or ahistorical manner. The use of modern categories and discourses to describe and explain earlier experiences (instead of examining them 'on their own terms'), as well as the imposition of present sensibilities on the past, are all potential hazards of the enterprise – but again, not ones strictly limited to the various forms of 'people's history.' Still, the difficulty of interpreting past behavior and understanding the meaning(s) that historical actors ascribed to their actions is a staggeringly difficult enterprise (Bell, 2002: 271). Microhistorians and historians of the everyday also run the risk, and have been faulted for, romanticizing the past, focusing on 'picturesque detail,' and sentimentally celebrating ordinary people as heroes, proto-feminists, or freedom fighters; others have accused them of 'trivializing' the crimes committed by oppressive regimes such as the Third Reich by overstating the possibilities for resistance and nonconformity at the grass roots (Lüdtke, 1995: 10–12).

All of this draws attention to one of the great philosophical debates that microhistory and the history of everyday life bring front and center: the relationship between structure and agency, between free will and determinism. In fact, one of the greatest challenges of the genre is navigating between "the Scylla of blind historical forces that determine individual behaviors, and the Charybdis of a romanticized self-determination by radically free historical actors" (Gregory, 1999: 105) – i.e., not exaggerating or distorting the possibilities of agency in highly repressive societies (or in ones that used more refined methods of repression and surveillance in an effort to ensure conformity), or of downplaying the extent to which larger structures and institutional forces shape the lives of ordinary individuals. As Karl Marx famously put it in *The Eighteenth Brumaire of Louis Bonaparte* (1852), "Men make their own history, but they do not make it just as they please; they do not make it under circumstances chosen by themselves, but under circumstances already existing, given, and transmitted from the past." But historians of everyday life try to show the ways in which 'collective phenomena' are themselves the very result of individual agency and the actions of ordinary people: "The systems that presumably govern the world are not alien to everyday life but immanent in it; the living of everyday life itself is itself part and parcel of the process by which structure and ideology are reproduced and transformed." In other words, ordinary people themselves supposedly "hold the lion's share of responsibility for making that collective world" (Steege et al., 2008: 367–368, 372).

Scholars working on everyday life in Germany during the Third Reich have, in fact, been especially adept at describing the 'ambivalences and ambiguities' (Eley, 1989: 325) – the 'dark side' (Port, 2013) – of behavior at the grass roots, pointing out the ways in which ordinary Germans supported and profited from the regime's discriminatory policies at the same time that they bucked the system and pursued their own interests. Alf Lüdtke has aptly described this practice involving both complicity and resistance as *Eigensinn*, a notoriously difficult term to translate or even define precisely, but one that draws attention to the 'sliver of autonomy' (Bucur et al., 2009: 190) enjoyed by the seemingly powerless and weak – while, at the same time, rightly emphasizing the ambiguous and multivalent nature of most behavior (Lüdtke, 1995). This draws attention, in turn, to the way in which the everyday provides both a 'training ground' of sorts for conformity, as well as a site where conformity can be 'evaded' and acts of nonconformity can take place (Highmore, 2002b: 5).

Historians of everyday life and microhistorians have also had to contend with another criticism frequently leveled since local or 'case' studies first became popular in the 1960s: this involves the extent to which the individual, community, or event at the center of a given study are truly 'representative' of larger trends. All persons, communities, and historical events are in some way 'unique,' of course. But since the adoption of social science methods and insights in historical research, as well as E.H. Carr's calls in the early 1960s for a greater emphasis on causation and sophisticated historical analysis (as opposed to 'mere' narration), historians have been at pains to make larger analytical claims about the importance of their own often narrowly focused studies and relate the particular to the general, i.e., to larger historical trends and developments.

Microhistorians have been especially cognizant of this thorny challenge, given the radically reduced scale of their investigations, as well as their resolute insistence on context. Some concede the need for a comparative dimension, i.e., the need to compare their findings and conclusions to other similarly circumscribed studies. But they rightly insist that some issues can best be understood at the micro level – and others, for that matter, at the macro level. Institutions and institutional power, for example, would fall into the latter category, intimate relationships within the family and the very fluidity of identity in the other. A focus on formal power relations, institutions, and high-level policy often fails to comprehend or explain how and why things developed as they did on the ground – often in ways not intended by authorities and elites, as recent research on everyday life in the Soviet bloc has revealed (Port, 2007). In other words, the 'microphysics of power' at the grass roots can effectively serve to undermine and mitigate against the power of larger structural forces and processes (Steege et al., 2008: 361). Still, integrating and relating those two levels in a meaningful manner – balancing intimacy and distance, establishing causal connections – is one of the greatest challenges faced by microhistorians and historians of the everyday. The following cartographic analogy is useful for making this point: "it is a mistake to hand someone an architectural blueprint if he or she wants to drive to another city. The key is knowing which map we need in a particular instance, and

how to combine harmoniously maps of different scales" (Gregory, 1999: 109). Siegfried Kracauer believed that Marc Bloch, one of the founders of the *Annales* School, offered a venerable model in his two-volume *Feudal Society* (1939–40), which provides "a constant back and forth between micro- and macrohistory, between close-ups and extreme long shots" (Levi, 1991: 27).

In response to the issue of 'representativeness,' microhistorians in particular have embraced the concept of the 'normal exception,' a term originally coined by Edoardo Grendi. These are forms of seemingly unusual behavior that defy prevailing norms, which is the very reason they leave traces in the archives. But they do so on a regular basis, and – though contrary to what those in power and other elites consider to be 'normal' behavior – are completely normal for ordinary individuals, especially those on the socioeconomic margins of society. Such 'transgressions' are, in fact, 'perfectly representative of their own social milieu' (Muir, 1991: xiv). Of course, the ability to recognize something as a 'normal exception' in the first place posits an a priori grasp of larger patterns only afforded by a macro view. The focus on that which fails to fit into grand frameworks or narratives, that throws a wrench in the relentless search for regularity and predictability, highlights, in short, the complexity of reality, of the 'really real' – which is, after all, what everyday life at the grass roots truly claims to represent, or at least one significant aspect of it.

The Future of 'People's History'

The history of everyday life and microhistory enjoyed tremendous popularity in the 1980s. *Alltagsgeschichte* itself was hailed at the time as "the most important new departure" in West German historiography (Eley, 1989: 297). But by the end of the following decade, it, along with social history as a whole, had been largely eclipsed by the 'new cultural history' popular in the United States, which looked to the insights of postmodernism and the so-called linguistic turn for inspiration. Despite important differences in terms of method, assumptions, and intellectual influences, all of these new approaches shared a certain affinity in terms of what they criticized about the older historiography's focus on major events, powerful individuals, and dominant institutions – and then, with the rise of social science history, on the gothic structures and intangible historical forces associated with a steadfast materialist interpretation of 'how history works.'

Even though 'history from below,' microhistory, and *Alltagsgeschichte* are no longer as popular as they once were, reports of their death have indeed been 'greatly exaggerated' (Steege et al., 2008: 358). A number of historians in Europe and the United States continue to produce important specimens of this genre and continue to discuss its theoretical underpinnings and potential contributions – for example, in writing about the states that made up the now-defunct Soviet bloc. By examining the complex relationship between 'state' and 'society,' their post-1945 history suggests the fruitful ways in which an understanding of life at the grass roots can help explain developments and trajectories that an investigation of institutions, parties, and high-level politics cannot alone. It shows, in short, that even under regimes where the power relationship between the 'rulers' and 'ruled' was clearly asymmetrical, developments at the micro level could and did have a major influence on those at the macro.

It is a truism that contemporary politics can have a significant effect on the types of history pursued by a given generation, as well as on the research topics that interest its members. The sudden popularity of 'history from below' in the 1960s – especially the interest in ordinary people, social protest, and the behavior of 'crowds' – clearly reflected the political turmoil, social upheaval, and critical atmosphere of that decade. Changing political sensibilities and disappointments have since then marked a dramatic shift away from an interest in the plight of the working classes to that of other groups, including women, ethnic minorities, and colonial subjects. As Wendy Goldman has noted, "Today, historians seem more interested in identity, nationality, ethnicity, globalisation, and transnational histories, which reflect in turn preoccupations of our contemporary world" (Bucur et al., 2009: 199). That is undoubtedly true, yet recent political developments in a world increasingly dominated by global financial institutions and structures seemingly beyond the control of ordinary individuals – from the 'Arab Spring' in the Middle East to the emergence of the 'Occupy Movement' in the West – might very well spark a renewed interest in 'people's history' and the emphasis it places on the power and agency of ordinary individuals.

History: Overview

Jörn Rüsen, Institute for Advanced Study in the Humanities, Essen, Germany; and University of Witten/Herdecke, Bochum, Germany

© 2015 Elsevier Ltd. All rights reserved.

Abstract

This article presents history as a fundamental factor of cultural life. It addresses its anthropological fundaments in the human endeavor to make sense out of the experience of time. It tackles the narrative form of historical knowledge and the typology of historical representation. Special reference is made to the problem of intercultural communication and the power of ethnocentrism, its danger and chances to overcome it.

Anthropological Universals

On a general and fundamental anthropological level, history is the totality of the cultural practices through which human beings interpret their past in order to understand the present and anticipate the future. In other words, history is the generation of sense out of the experience of time.

But not every interpretation of time is historical. What determines the historical quality of an interpretation is the fact that time confronts human beings in two ways: *as real change within the world*, in which contingent events occur and are experienced, and as an *interior, temporal extension of consciousness* (and of the unconscious). Here, memories, imaginations, knowledge, intentions, and objectives, guided by the elemental mental forces of fear, anxiety, desire, hope, and longing, play a central role. We interpret the 'objective' time of real change (the present) through the recollection of another time (the past); thus the 'subjective' time into which we project a future is bound to our approach to past experiences. This is human culture's specifically historical procedure for experience and interpretation. What defines the historical interpretation of time is its implicitly meaningful and thus orientative conception of the course of time. The latter comprises the past, the present, and the future and at the same time articulates experiences and intentions; it is thus empirical and normative at the same time. The philosophy of history explicates this conception of the course of time as a particular mental structure. Even without philosophical reflection or justification, such a conception of the course of time organizes historical thought, and shapes its content. History interprets the contingent events of the past and defines their significance for the present. It organizes historical narrative as a particular kind of explanation (Danto, 1965). It is this 'explanation through narration' that defines the logic of historical thought in its academic form as well.

Conceptions of Time

The different conceptions of the course of time important for historical interpretation employ various temporal categories in various constellations (e.g., cyclical time, linear time, the concept of the *kairos*), each encouraging particular expectations: decline, progress, permanence, recurrence, revolution, destruction, and so on. They relate real temporal processes to the active intentions and self-conceptions of the subjects that make use of them. In other words, history mediates the subjectivity of acting and suffering human beings with the objectivity of the temporal process of their world (Rüsen, 2007). In early societies, this is accomplished by an appeal to divine forces, which impel the transformation of the world and the human spirit at the same time; in other societies, these divine forces are replaced by humankind as a spiritual and moral being, its ability to create symbolic worlds or to plan the conquest of the natural and social world through knowledge. Finally, nature too can be invoked as a sort of metaphysical instance for the continuity between the two temporal dimensions of human historicity. Nature can thus be understood as that which compels the human race, by means of social antagonisms, to create culture (as in Kant, for example), or as struggle of the races in Social Darwinist terms. Psychoanalysis, on the other hand, posits an interior, psychological nature, in order to explain the historical movement of the human world by means of the dynamics of the unconscious.

The idea of one single 'history' comprising all temporal change within the human world is of modern origin (Koselleck, 1985). However, it has a premodern equivalent in older cosmogonies, theogonies, and anthropogonies, as well as in the concept of redemptive history.

History as Event and Narration

In every culture and epoch 'history' has a *double meaning*. On the one hand, it designates *temporally organized events* in the past. At the same time, and inseparably from the first meaning, 'history' also means *the account of these events* that articulates their significance for our understanding of ourselves and of our world. The first meaning has to do with temporal succession, the second with its narrative representation.

Not everything that has happened can be called history, but rather only that which is somehow meaningful in the present: as for example the foundation of a city or a kingdom is significant to its inhabitants, as a person's birthday is significant to him or her, and so on. Usually this event is described in a sequence of occurrences. These may often be the actions of human beings, heroes, or divine beings, as in myth or epic; however, they may also involve more complicated phenomena, such as the development of a manufacturing process, the evolution in the meaning of a concept, the epochal transformation of a mentality, an 'axial time,' and so on.

In its second meaning, history is the representation of the past in the culture of the present. Here 'history' is the product of

historical consciousness: By the work of memory the past has come to life and meaning in a narrative form. In this way the past 'in itself,' that is, everything that happened, and has persisted as trace, relic, memorial, tradition, ethic, and so on becomes history 'for us.' I suggest to distinguish and organize the basic mental procedures involved in the following way:

- *Perception* of a different time that is owed to the fascination or the burdening awareness of the archaic, the obsolete, the mysterious trace, the persistent memorial, and so on;
- *Interpretation* of this time as temporal movement in the human world, according to some meaningful aspects (e.g., as evidence of the permanence of certain values, as examples of a general rule, as progress, etc.);
- *Orientation* of human practice by interpretation that can be generated in two ways – both by an external and an internal perspective. In the external perspective, human activity gets its temporal dimension relevant for shaping its intentions. Examples for this perspective are an increase of political legitimacy through political participation, or the restitution of the world before its destruction, or the renewal of acceptable life forms against the decline of morals. In the internal perspective human subjectivity gets its temporal dimension, where identity as a strong belief in belonging to and be different from others is at stake (e.g., "We are the children of the sun," or "We as a nation stand for the universality and achievements of human rights," or "We belong to the communion of saints," or "We represent true spirituality in contrast to the others' materialism"); and finally
- *Motivation for action* provided by this orientation (e.g., willingness to sacrifice oneself, even die for a certain ideal etc., or to kill others for the sake of historical ideas of national greatness, the missionary spirit, etc.)

Memory, History, and Master Narratives

There is an ongoing debate about the relationship between *memory* and *historical consciousness* (Megill, 1998; Seixas, 2004). Memory in the everyday sense refers to past experiences of individuals in their own lives, whereas historical consciousness primarily thematizes a past that exceeds an individual life span. Both, however – the individual memory on which individuality and social affiliation are built as well as the expansion of 'history' beyond the limits of a single life span back into the past – are inseparable like two sides of a coin: human beings tend to transform their own identities into temporally more comprising (including) structures, such as the community of saints, the nation, the people, the culture, and so on. The basis for the individuals' self-esteem and their practical temporal orientation tends to exceed their life span or to outlive them. It thus usually reaches far back into the past (Assmann, 1995).

'History' generally performs its orientative function by a 'master narrative' or 'metanarrative.' This describes the conception and evolution of the addressee's world in order to legitimate its normative framework. At the same time, it provides an experiential inventory that is available whenever problems of orientation require a solution by consensus. It depicts, confirms, and legitimates not only systems of politics, economics, and environment, but also the collective and individual subjectivity and identity of the people. Master narratives represent social affiliation and differentiation, internally and externally.

Master narratives generally organize social inclusion and exclusion *ethnocentrically*, ascribe positive normative characteristics and weight to one group (mostly one's own) and negative ones to other different groups. One's own lifeworld appears as cultured or civilized, whereas other worlds are looked upon as savage and barbaric. This difference can be articulated in different ways: as utterly opposed to one's own, as deviation from a norm, as retarded in development, etc. Just as history presents past experiences as a 'mirror' in which the present perceives itself, the image of others in the same historical mirror has a contrastive function: it defines a self-image. Under special conditions of an orientation crisis, however, the 'other' may be ascribed admirable features, as we can find in the image of the 'noble savage.'

Historical Culture

The interpretative work of historical consciousness and its product called 'history' becomes manifest in a society's *historical culture* (Karlsson, 2011). Historical culture is multidimensional, like every other part of human culture. It has religious, ethical, pedagogical, political, and rhetorical expressions; its cognitive substance always aims at the knowledge of 'wie es eigentlich gewesen' (how it really was). In an artificial way, we can distinguish five basic dimensions of historical culture as ideal types, each of which is quite different in its logic and thus accountable to different criteria of meaning:

- The *political* dimension is concerned with the legitimation of a political order in the context of historical thinking. Historical consciousness inscribes this order into the identity concepts of the people. Doing so the decisive principle of making sense of the past is *legitimacy* of power and domination.
- The *aesthetic* dimension is concerned with the emotional effectiveness of historical interpretations, or the domain which appeals to and affects the human senses. A strong historical orientation must always engage the senses. Pictures, sculptures, public monuments, and museums serve this purpose. Masquerades, dances, and music can all have historical content. Many older master narratives are composed in a poetic form and are ritually performed. Historical knowledge must employ literary models to become discursive. In doing so historical culture is guided by the sense criterion of formal coherence in a narrative representation and (traditionally called 'beauty').
- The *cognitive* dimension is concerned with the knowledge of past events significant for the present and the future. Without the element of knowledge, the recollection of the past cannot effectively be introduced into discourses concerned with the interpretation of current temporal experience. Mythical master narratives, too, have a cognitive status, though scientific method and practice may deprive them of it. They lose their orientative power when confronted with a knowledge of the past that possesses a more

elaborated relation to experience. In this dimension historical thinking refers to the sense criterion of truth.

- The *ethical* dimension is constituted by norms and values which stem from the social context of the historians. Here the past is subordinated to the judgments of the present. This relationship can be intensified to a concept of historical responsibility (Bédarida, 1995; Carr et al., 2004) that is based on an intergenerational connection between forefathers and offspring. The sense criterion in this dimension is the distinction between good and evil.
- The *religious* dimension refers to the temporal extension of sacred elements of human life. Here history is shaped by the sense criterion of redemption. Traditionally it opens up a perspective of transcendence in the representation of the past, but in modern times it may achieve a highly ideological form of innerworldly or secular religion (as developed in Marxism or fascism). Today, historical culture is characterized by an unreconciled relationship between secularism (most effectively manifested in historical studies as an academic discipline) and still powerful religious approaches to human life.

The interrelationship of these dimensions is complex, flexible, changeable, and full of tensions and conflicts. The different sense criteria try to dominate and instrumentalize each other. They need a discursive mode of interrelationship within which they may complement each other. A unifying principle of this discourse may be gained out of a cultural anthropology of historical thinking. It has to emphasize the potentials of overcoming ethnocentric factors in historical culture by referring to fundamental and universal values inherent in the cultural nature of every human being (Antweiler, 2012; Rüsen, 2012).

Typologies of Historical Representation

Synchronic and diachronic *typologies of the historical* can be generated out of the particulars of historical thought, and inquire into its carriers, functions, class and gender specificity, and other factors within the context of the social framework of determinations (Rüsen, 1996). Yet they only become historically specific, when they are capable to differentiate the specific interpretative work of historical consciousness and of its product – 'history.' Here history appears as the cultural orientation system of temporal consciousness – constructed according to the different potentials of historical meaning. Such a differentiation gained by a metatheoretical perspective has yet been little tackled. Previous efforts have usually focused on functional and formal aspects, and have less thematized the total domain of human temporal interpretation but simply the domain of historical writing. If at all only the Western tradition was considered. Nonetheless, such typologies can be used as analytical tools for the research in the wide areas of historical culture, especially for intercultural comparisons.

Nietzsche, for example, distinguished the monumental, the antiquarian, and the critical uses of history in terms of their advantages and disadvantages for life (Nietzsche, 1985).

Hayden White (1973) presented a very influential model for the analysis of historical writing, and applied it to the most significant historians and philosophers of history in the nineteenth century. It consists of a complex strategy of creating historical meaning by *emplotment* (with its variations of romance, tragedy, comedy, and satire), *formal argument* (with its variations of formalist, organicist, mechanistic, and contextual thinking), *ideological implication* (with its variations of anarchism, conservatism, radicalism, and liberalism), and *tropes* of historical discourse (with their variations of metaphorical, metonymic, synecdochic, or ironic uses of language).

White developed this typology for the analysis of historiographical texts; nevertheless, it can be applied to other manifestations of history, such as historical museums (cf Bann, 1984).

Rüsen (2005: pp. 9–19) also developed a universally applicable typology of historical sense generation according to its most basic principles: its particular references, its conception of temporal movement, its communicative form, and its identity concept. All these factors are communicated and constituted by the principle of historical sense:

- The *traditional type* recalls the origins grounding present relations. Traditional history represents the course of events in terms of the persistence of these origins and their normative power, and represents identity by affirming previous interpretive models of human subjectivity (e.g., social roles).
- The *exemplary type* recalls past facts that concretize the rules of human conduct. Exemplary history represents a course of events in terms of the transtemporal applicability of these rules, and constructs identity as rule-based competence. This narrative type is represented in Europe by the classical motto *historia vitae magistra*, in China sometimes by the metaphor of the mirror. This type is predominant in the historical thought of great civilizations up to modern times.
- The *genetic type* recalls qualitative changes in the past by which other and strange conditions become familiar ones in the present. The genetic construction of meaning presents a course of events as evolution, in which conditions change in order to become dynamically permanent. It constructs identity as the synthesis of permanence and change, in other words as a dynamic process. This type predominates in modern societies.
- The *critical type* recalls past events in order to use them as counterfacts against established patterns of historical orientation. Critical history constructs identity by negating pregiven identity-forming interpretive models, in other words, as the power to say 'no.'

Media

The diverse manifestation of history, in its dual significance as fact and as interpretation, crucially depends on the *medium* through which temporal experience and interpretation is communicated. *Language* is always predominant, although there are other creative areas of historical perception and representation, such as the visual and musical arts, architecture, and dance. The modes by which language puts human communication in order are decisive for the expression of historical consciousness.

History was originally communicated orally, as it is done now – in the private or informal sphere. In preliterate cultures, history becomes *oral history* or *oral tradition* (Vansina, 1985). Such a history is usually politically conservative: the traditional world order becomes obligatory; new experiences have to be integrated into it so as to confirm the collective's basic norms and identity. Such representations are sensually appealing to the senses and concrete; they are communicated face to face and correspondingly have immediate effects. The criteria of reference are of a mythical nature. Its validity claims are raised and made plausible through ritual and repetition. In modern historical research, *oral history* is the method for gaining historical knowledge from the recollections of people as actors and witnesses. Thus bit provides an important source for research about the mechanisms of biographical memory as an element of historical culture in the intersection of the public sphere and individual biography. The memories of witnesses about historically significant events, communicated orally, have obtained an important role in public historical culture – especially by the testimonies of survivors of great catastrophes such as the Holocaust (Langer, 1991).

The medium of *writing* has dominated for thousands of years and continues to dominate contemporary historical culture (in which, of course, oral elements continue as important and effective). Written history frees from the immediacy of the communicative situation and creates a distance between history as content and history as a form of communication (Ong, 1982). This distance increases the experiential horizon of historical consciousness to a large degree; it facilitates new methods for accumulating as well as managing experience. It provides new opportunities for objectivation in the approach to historical experience and it discloses new opportunities for subjectivation through historical interpretation as well: the narrator can become an author, and readers can obtain an expanded scope for critical readings. Validity claims are raised either through canonization, or become an opportunity for discursive justification. In either case, interpretation becomes a discrete practice of historical meaning construction; here lies its potential of specialization and the corresponding strategies of mediation and popularization. The original relationship between poetry and truth is dissolved; mythology has now become the potential subject for fundamental critique. Explicit conceptualization has received an essential cognitive element in the historical interpretation, so that history can, at least in the long run, become an object of study and theory.

Entirely *new media* have recently transformed the historical mode of thought. We cannot yet distinguish distinct lines of development and stable structures, but we can certainly indicate new developments from which we may expect transformations of the most basic kind.

The Internet has provided historical culture with an enormous input and enlargement of information and communication. It has opened up new possibilities of constructing individual historical perspectives according to the specific life situation of different people. It offers unlimited access to accumulating knowledge of the past and challenges the recipients to give it a peculiar meaning for their lives. By using this possibility everyone has become his or her own historian (Foner, 2002). This could lead to an anarchic fragmentation of historical culture and at the same time to an intensified communication with new chances of participation. It weakens pregiven (e.g., national) borders and limits of historical identity thus opening up new horizons of awareness: to be part of humanity as the broadest scope of placing one's own life into the temporal change of the human world.

This enlargement of the realm of historical culture goes along with a fundamental change in making sense of the past. In the historical culture of the public sphere, collective memory is flooded by a torrent of historical images. The forms of consciousness elaborated by scholars and literates (literacy) – and above all by the distancing work of rationality – are in danger of decreasing in significance, and especially in political efficiency. The grammar of history is progressively becoming imagology of presentations in which every era is contemporaneous, and the fundamental idea of a fundamental linear movement of time is disappearing. The constitutive difference of temporality thus might be suspended into a universal contemporaneity that can no longer be narratively put into order. Whether there can then be a specific 'historical order' within the orientative temporal continuity between the past, the present, and the future has at least become a problem. The very term of *posthistoire*, and the related discussion of a mode of life without genuinely historical interpretation (Niethammer, 1992), suggests that these questions are now open. At the same time, there has been an immense increase in access to data. New storage media allow new modes of historical experience, and radically call into question previous criteria of significance. At the same time, new media of communication – such as the Internet – permit no isolated, politically sanctioned decision about the meaning of history The abundance of possibilities and the diversity of new voices require new strategies, new forms, and new contents of historically grounded participation and exclusion. In each case, fixed ideas of the permanence and substance of individual and collective identity are being outstripped by the diversity of global communication, in favor of more dynamic and more open differentiations. This process then provokes reactions, which stubbornly insist on ethnocentric distinctions, often expressed through these new media as well.

Developments

The transformation in the media of historical thought as sketched above suggests a *transcultural*, *macrohistorical transformation* that will ultimately leave no culture unaffected. This may provide us with a cognitive mean for a diachronic classification of historiographical variety. Such a classification could be organized in terms of epochal distinctions, with still a typological quality. For example, White's or Rüsen's typologies could both be used to characterize historical processes. White's sequence of tropes can be understood as cyclical, and Rüsen's distinction between traditional, exemplary, and genetic historical thought can describe the great transcultural epochs where the critical type of historical thought mediates the transition between the other types.

One of the most important distinctions concerns the relationship between myth and 'history,' where the latter treats worldly affairs. Myth on the contrary, relates to a divine

prehistory as the source of meaning (Eliade, 1991). In contrast, 'historical thought' in the stricter sense discerns the meaning of history in the immanent dimension of a chain of events (*res gestae*). The Judeo-Christian sacred history mediates between these two modes of thought, and allows events in the world to appear as the manifestation of God's power and God's will. In other cultures, the divine and the mundane are mediated differently: mundane but somehow significant events have to be integrated into a comprehensive cosmic order. History becomes meaningful through nature, which is conceived as divinely ordered. With increasing complexity in human praxis, more and more mundane incidents are integrated into this order until it is finally 'historicized' and 'denaturalized.' Yet this process is often opposed by attempts to renaturalize it as biological racism.

Comprehensive large-scale developments of historical thought have very often been conceptualized as leading to the current status of historical studies. This has often been criticized as too one-sided, so the diversity of the new media and the different dimensions of the historical culture are emphasized instead. Nevertheless, plausible accounts of a developmental process can be articulated (in the form of typological hypotheses). These accounts can be used to discern and analyze transformations of historical thought in the diversity of different cultures.

Max Weber's conception of a universal process of *rationalization and disenchantment* appears as relevant as ever (Weber, 1988). The classical philosophy of history of Voltaire, Kant, and Hegel presented these criteria in the form of the actual course of events. Since historical studies acquired increased competence in investigating and representing real events in the past, the question of meaning was investigated within the framework of a logic of historical thought (Dilthey, Max Weber, Rickert). Presently this question is perceived primarily as the concern of the central verbal procedure of historical thought, as historical narrative (Danto, 1965). Issues of scholarly standards and truth claims (Evans, 1999) might be obscured by only focusing on the rhetorical and poetic strategies of historical writing (Rigney, 1990).

Despite this formalization of historical understanding the structures of real historical processes remain important points of reference. Here the global and often conflictual transformations brought about by modern industrial societies are in the foreground. Their developmental dynamics can be understood only by a concept of time in which the horizon of experience and expectation structurally diverge, and which can only be reconnected by a fundamental temporalization of the human world (Koselleck, 1985).

Narratives of progressive rationalization and disenchantment must, of course, be complemented by an account of a critical and transcendent re-enchantment resistant to methodical rationality, such as the endlessly renewed rationality of sense (value rationality); it refuses to dissolve in the methodical rationality of the control of experience. Historical studies, the development of which in Europe from the eighteenth century until now has been the most effective factor in the modernization of the historical culture, must employ sense criteria that methodical rationality alone cannot generate (Iggers et al., 2008).

The rationalization of modern historical culture is constituted by a universalization of the norms and values that render the past significant for the present. In the realm of these values, the ethnocentric logic of identity formation plays an enormously important role. It has always had a universalizing tendency, insofar as it describes its own world as both unique and normatively obligatory. In order to overcome the conflict-bearing power of ethnocentrism, one should emphasize the concept of 'humanity.' Humanity is a common frame of reference for historical identity. In the focus of historical experience, humanity is extended to the limits of the known world. In the logical framework of ethnocentrism this universality creates a fundamental, structural conflict of cultures in historical thought that has repeatedly led to violence, to the legitimation of domination, and even to genocide.

Problems of Intercultural Communication

This leads us to a fundamental problem in contemporary historical thought. It is shaped by the rationalism that culminates in historical scholarship and related human sciences (Bentley, 1997). This rationalization of history as scholarship corresponds to the modern rationalization of all knowledge, without which the organization of modern societies would be inconceivable. Is historical thought inseparable from the value system of Western culture in its current form along with this methodological rationality? If so, how can it conceive history in such a way that it accounts for the diversity in different cultures' articulations of 'history' as the orientative framework of human praxis? Does this diversity, once it has been researched and analyzed by scholarship, not always appear in the light of a particular interpretation – namely the interpretation to which methodological reason essentially belongs? (Seth, 2004)

Current tendencies in historical thought (postmodernism, postcolonialism, the 'cultural turn') are determined to overcome modernity in this sense. They want to create a pluralism of 'histories' that can break the spell of a uniforming rationality and a generalizing normativity. They thereby destroy the orientative power of modern historical thought with its notion of a unified direction of development, or 'progress.' At the same time they problematize the claims of scholarship that describe the laws of such development along with the desire for mastering them, e.g., as we can find in Marxism.

In the age of globalization, in spite of the critique of the claim for hegemony inherent in Western historical thought, we cannot do without either methodological rationality or the universal regulative of communication. We need this regulative to understand the present by the interpretation of the past, to define inclusion and exclusion, and to act in anticipation of the future. If the ethnocentric logic of such a universalization is to be broken or overcome, the truly universal regulative of historical thought and of historical culture can only *be a mutual and thereby universal recognition of difference and particularity*. The practice of this recognition is based upon and guided by a fundamental and universal idea of human dignity, and this idea serves as a generally acceptable principle of criticism. It is and will remain counterfactual, even utopian; nevertheless, it may disclose new dimensions of historical experience and lead to new and politically significant orientations of human life in time (Kozlarek et al., 2012).

Ethnocentrism is still effective in historical thinking. It is mainly criticized as an established form in the tradition of

historical studies as they have emerged in the West since the end of the eighteenth century. Here universalistic concepts of historical interpretation can be deciphered as generalized cultural peculiarities of the West. Postcolonialism therefore contradicts these ideas, but by doing so it uses the logic of ethnocentrism by negation. Other attempts of refusing Western traditions in historical thinking replace them by non-Western ideas, and by doing so, they create new ethnocentric attitudes that are becoming visible, e.g., as Sinocentrism (Huang, 2007; Sato, 2007).

There is no neutral standpoint beyond different cultural orientations. Postmodernism therefore proposes a relativistic idea of history, where every human is his or her own historian, and where the general validity of historical cognition is only a 'noble dream' (Novick, 1988). But this relativism destroys any possibility of critical argumentation in intercultural communication. It prevents a cognitive achievement, which may meet the challenge of globalization, which has to bring cultural difference into a new mode of thinking beyond the destructive power of ethnocentrism. In this new mode, difference and unity have to be recognized and synthesized at the same time.

This is possible by referring to anthropological universals in historical thinking. They frame the diversity of human life forms in time and space by a new idea of humankind (Antweiler, 2012; Rüsen and Laass, 2009). In difference to the tradition of philosophical thinking about history, which has unified it as one encompassing development of human life forms, this idea makes the unity visible in the diversity of life forms and their changes. The unity of humankind can only be understood by referring to the diversity and changeability of civilizations. By historical thinking and its hermeneutical approach to cultural difference this synthesis of unity and diversity can be brought about and achieved.

This new way of historical thinking, by which it meets the challenge of globalization, has to answer another challenge as well. The terrors and catastrophes of the twentieth century, such as the Holocaust, demand for new categories of historical thinking and new forms of historical narration. Without the categories of inhumanity and suffering historical thinking will miss this challenge. And without applying the possibility of integrating senselessness into its meaning – construction concerning the past, historical thinking will miss the dark side of human history, that cannot certainly be overlooked any longer (Friedländer, 1998).

Abstract

A distinction is made between a historical professional who is able to live from writing or else producing history, and a historical professional who is regarded as a fully competent historian by the academic community. The history of professionals in the first sense is followed from Antiquity (especially old China) to the present. The second sense of the term is newer than the phenomenon that started to develop in the eighteenth century and found a full dissemination in the nineteenth and twentieth centuries. Different stages of historical professionalism are discerned, starting with Ranke's followers from around 1830, whose state-centered professionalism was followed by a methodological phase from the 1880s. After 1950, other criteria than method were given priority, and these have come to compete with each other.

It is evident that the term 'professional' in this connection has two different meanings, which are related to each other but are not equivalent. The first (a) is professional in the sense of being able to live by the trade (in the meaning of an occupation, such as the French word 'profession'). The second (b) is professional as a qualified person who is recognized by society (not least by his or her fellows in academia) as competent to practice the trade with a closure directed against nonprofessionals, that is, amateurs and those writing on history without being 'real' researchers.

The Historian's Profession as Breadwinning

In the first sense of professionalism (see Professions and Professionalization, History of), there have been professional historians for a long time but there is no distinct collective process of professionalization. The writing of history is age-old. Some famous history writers were active in European antiquity, and especially Herodotus and Thucydides of Greece have won lasting fame. These and other early European historians were not writing history for their living. In China from at least the second century BC, and later in Korea and Japan, historians were engaged to describe the history of their country under a dynasty. This usage involved a real employment in China, and it even entailed a personal responsibility of the historian for what he wrote. Sima Qian (born *c.* 145 BC) was employed as Grand Scribe (or Historian) by Emperor Wu of the Han dynasty in 105 BC, which made it possible for him to live by his professional work. He was able to do researches in the imperial library and archives and thus composed his major history, the *Shiji*. Besides that, he worked on an improved calendar system and a sort of theoretical discourse on history (Wang, 1995; Nienhauser 2011). He and other Chinese dynastic historians were obviously fully occupied and cannot even normally have worked alone but must have had a small office with clerks at their disposal (there were subordinate scribes). The Chinese professionalism among its historians had no known counterparts. In Korea, the first well-known historians (eighth century AD) were politicians who wrote on their own behalf. In India, there were no real historians until the thirteenth century because of the dominant cyclical time perception in Hindu culture. The late Roman and medieval European historiographers had little profit from their writing and could not live from it. "A book belonged to its author for as long as it stayed in his hands. After that it was free as air" (Smalley, 1974). Some late medieval chroniclers in Europe, however, managed to live by their work as historians. Such chroniclers were employed by princes or cities in order to relate the important events that took place within the principality or city.

In Europe, the chroniclers employed by princes and cities (those active in monasteries were not employed for the purpose and so were not formally living by their historical writings) were followed later by official historiographers hired by kings and states for the 'proper' recording of the wars in which their masters were engaged. Titles like Historiographer of the Realm (in variations all over Europe) make clear the official mission of the historian. The French Historiographe du Roi was a title used from 1554 to 1824, and 104 persons bore the title. It was not so much a function as a title with a reward, and the historiographers were not highly regarded at court (Boer, 1998). For most such official historiographers, the revenue from the title was only a side income and not enough to live on. Quite another type of professional historian in this sense arose with the great wars in Europe in the seventeenth century: those who lived from their reports from the war scenes. They established a form of market situation for themselves, and especially those behind the Theatrum Europaeum were successful in their branch, a sort of intermediary between history and journalism.

University professors of history appeared from the seventeenth century but became a group of importance only from the eighteenth century and then primarily in German states. Until the late nineteenth century, only full professors normally were able to live, and sometimes live well, by their salaries, while their subordinate teachers were poorly paid if at all (Lingelbach, 2011).

Already from the late eighteenth century, another type of professional historian, in sense (a) of the word, appeared in Europe: literary men writing history and more or less living by their literary accomplishments. Men like Voltaire, Gibbon, Robertson, and, to an extent, Schlözer and Herder made themselves known as historians (though primarily as learned and literary men), and their works were sold in editions of considerable numbers. Their ambition was to a large extent to give to the reader an impression of historical personalities and their struggle with moral problems, a sort of applied political science or applied moral philosophy. These historians did not

strive for new factual knowledge at first hand but rather a better insight into the moral problems of politics pursued by states and kings. Such literary professionals who worked with historical subjects were more successful than the contemporary professors of the universities of Europe, who also earned their living from history and who were mostly not well known.

Still, in the (a) sense of the word 'professional,' the authors of the 'broad' literature on history had precursors in the eighteenth century in the form of school textbooks and, in England, orientations for magistrates written by employees in the legal system (Steedman, 2009). Popular narratives of history became common in Europe and the United States from the early nineteenth century. Many narrators of history wanted to give to their countrymen a better understanding of the past of their nation. Publishing narratives on national history for the broad layers of the population sometimes also gave a living to their authors already in the first half of the nineteenth century (Burke, 2011). It is easy to see the continuation of such popular narrative into the twentieth century. The number of persons who have had the possibility to earn their living by telling history in different media and not only in printed books has increased enormously. The demand for history as entertainment, originating in the eighteenth century among the upper classes, has grown and spread in society. In the twentieth century, publishers have been interested in different types of books, such as specialized historical works, textbooks for schools and universities, historical journals, historical fiction, and pure historical entertainment. Adaptations of history in various forms for radio and television have also gradually increased their share in the total turnout, and art film has been used for telling stories with a historical setting. The comprehensive number of persons who make their living from these forms of writing and processing history has never been calculated.

In the twentieth century, though starting around 1850, there has also been a great growth in the number of professional historians in sense (a) of the word, because of the growth of institutions where historians got employment, including the publishing establishments mentioned above (Lingelbach, 2003, 2011). Most numerous are, of course, those employed in teaching institutions. Here must be included all teachers specializing in history, both in secondary schools and at university level. Historians working in archives and museums also belong to this category. With the great expansion of secondary and tertiary education, the sector has been steadily growing in the twentieth century, especially after World War II. For France in 1910, Boer has estimated the number of historians in these categories to 1045 (Boer, 1998). On the eve of the 1950s, the number of professional historians in France was approximated as less than 3000, but then this number does not include archivists and historians employed in museums. In 1967, the number of the same limited category of professional historians had grown to close to 8000 (Charle, 1995). German and Australian calculations go in the same direction (Macintyre, 2000; Raphael, 2000).

Establishing Professionalism among Historians as a System of Norms

The second sense in which the term professional is used, "professional as a qualified person who is recognized by society (not least by his or her fellows in academia) as competent to practice the trade," has a more complicated historical reference. Historians who were recognized as competent historians by their contemporaries have existed for a long time. But in regard to the recognition by fellow historians, especially those with university posts, this is something much newer. If recognition is taken to mean an inclusion into a network, group, or formal association, only the history of the period from 1750 provided any means for the realization of such professionalism. If, further, a sort of common program of the network or group is required, the field is narrowed even more.

In the eighteenth century, German universities were flourishing and universities in other parts of Europe and its colonies were not. Because of the low level of state power in Germany, not only free authors could express their views but so could civil servants, such as professors. This made German universities, especially those in Halle and Göttingen, serve as nurseries for new notions in the humanities. Linguistics and history prospered. In the nineteenth century, 130 Protestant historians (plus an unknown number of Catholics) became full professors of history at German universities. For the first time, an occupational group of historians developed and a discourse on history emerged (Blanke, 1991). Mostly, however, these were individual accomplishments and the level of coordination between the learned men was low. Some historians (e.g., Johann Martin Chladenius and Johann Christoph Gatterer) lectured on rules and wrote on the theory of history (Reill, 1975). The process of standardization of methodological rules was, however, regarded with skepticism by some of the most important historians, such as August Ludwig Schlözer, who talked about imprisonment in scholarly rules, as Blanke has noted (Blanke, 1991). As to rules for the critical use of sources and general methodological emphasis, the introductory book by Friedrich Rühs from 1811 is noteworthy.

There were hardly any 'schools' of historians before well into the nineteenth century. Academic teaching of history and research in history were well established in many countries in the eighteenth century, though without a canon of methodology or a professed normative system, which applied to history as a discipline. History was rather regarded as a part of a wider discipline of morality, the French *sciences morales et politiques*. Past events could be used to show the consequences of different types of conduct, and new Enlightenment notions made it possible to analyze historical processes without referring to God or providence (Heilbron, 1990). For centuries, history had been used for this purpose, but the morality concerned changed its content and its stability in the eighteenth century.

The change, brought about primarily by Leopold von Ranke around 1830, was to create the conditions for a network of historians under the guidance of the master. He had meetings with his disciples, later known as his seminar, where problems of history were discussed. Ranke himself was a spokesman for three main principles of historical interpretation: the state as a central entity, the state system as the polity of international relations, and the necessity for the historian to evaluate each single entity for its role in history and not from its relation to contemporary politics. The first of these principles was a common ground for many thinkers of the period, but combined with the other two it formed a specific analytic system (Torstendahl, 2009). The third principle has been partly

traced back to forerunners in the eighteenth century (Meinecke, 1936; Blanke and Rüsen, 1984; Blanke, 1991) and it created the basis of the thought system, which became known as *Historismus*. Ranke's influential teaching made his version of this *Historismus* the basis of a conscious professional identity, which spread in Europe and had made inroads in many other parts of the world, especially the United States and East Asia (Berg, 1968; Eskildsen, 2008, 2009; Torstendahl, 2010).

In the German academic community of historians, the combination of *Historismus* and teaching through seminars became an instrument for the professionalization of historians. A common evaluative system was created in the latter half of the nineteenth century. A methodological part was often combined with individualization of persons and collective entities of the past, especially among the historians of the Middle Ages who were concerned with the editing of the *Monumenta Germaniae historica* (initiated in 1819; first volume published in 1826). This work elaborated further methodological principles for editing that were developed in France by Jean Mabillon and others from the seventeenth century onward, and that gave rise to the Ecole des Chartes (founded in 1821) at Paris. Methodology became important and the principles for the evaluation of sources became more and more systematized. A methodological direction of historians within the *Historismus* has therefore been discerned, with a philosophical direction as its counterpart. The former was characterized by its devotion to empirical studies with a sincere application of methodological principles in order to obtain objective knowledge, while the philosophical direction generally rejected the possibility of reaching any form of certainty and proclaimed the relativity of knowledge. In fact, it will seem that the differences within *Historismus* were great. On the one hand were those who saw historical relativism as fundamental and regarded history primarily as a means of orientation in the present. On the other hand were those who wanted to overcome as much as possible the constraints of the sources for understanding the past, though still with a considerable relativism in regard to values (Oexle, 1996; Scholtz, 1997).

A new turn of historical professionalism grew out of the empirical *Historismus*. It was important that new methodological manuals were published and widely accepted in the European community of historians. J. G. Droysen had lectured repeatedly on methodology and the principles of *Historismus* but the published version, his *Grundriss der Historik* (1868), was very concise. Ernst Bernheim's *Lehrbuch der Historischen Methode* (1889) and Charles-Victor Langlois' and Charles Seignobos' *Introduction des Etudes Historiques* (1898) were, in this regard, epoch making. These books were primarily methodological, but in both their different epistemological foundations played a great role. The books received a very wide circulation. They taught how to find secure knowledge in history. Their different philosophical bases occasionally gave rise to debates but their differences did not prevent their rule system from becoming widely appreciated among historians (Torstendahl, 2003).

An important result of the methodological turn of professionalism was that historians turned their attention to more and more limited problems. Around 1900, it was no longer usual for professional historians to make the whole history of a country the subject of their study. Rather they focused on a certain political event and its prehistory, for which they now were expected to gather all relevant material. The proper methods to evaluate sources were often regarded as a dividing line between professionals and amateurs.

Several factors helped to make methodology a central element in the professionalism of historians. One was the rise of national historical associations. This was a process that took place all over Europe (and also beyond Europe in some countries) in the latter half of the nineteenth century. Philosophical and political issues divided all such associations and, thus, only methodology was really a common basis. This was even more the case with the international congresses of historians, from 1926 organized by the Comité International des Sciences Historiques. The congresses can be traced back to 1898 but got their form later. In the programs of the international congresses of 1900 and 1903, methodology played an important role and the object of the discussion was which were the conclusions for the philosophical foundations that must be drawn from the established methods, rather than the other way around. After the congress of 1908, the French historian Simiand complained in a review article that methods had not been sufficiently emphasized in the congress contributions (Erdmann, 2005).

In the last decades of the nineteenth century and the early part of the twentieth, the historical associations of the European countries also in most cases started journals (Stieg, 1986). The influential German *Historische Zeitschrift* was, however, founded in 1859 as a private initiative by Heinrich von Sybel. The earliest still existing seems to be a Danish journal from 1838. During the twentieth century, the creation of journals of history became usual in all parts of the world, and some of these are much more than national journals but quite general (such as the *American Historical Review*, founded in 1895) or thematic for studies of the history of a major part of the world (such as the *Journal of Asian Studies*, founded in 1957). Other journals and reviews with a thematic or rather broad methodological focus, such as the *Revue de Synthese Historigue* (1900–31), the *Annales d'Histoire Economique et Sociale* (founded in 1929, and from 1946 called *Annales: Economies, Sociétés, Civilisations*), *Past and Present* (founded in 1952), the *Journal of Modern History* (founded in 1929), and so on, were later creations. In most of the journals, articles on themes of history were combined with critical reviews of books. An important element in such reviews was to examine the methods used and the shortcomings of authors in respect to methodological rules. Thus, in the form of critical reviews of the works on history, the methodological norms were spread. These norms were also commonly accepted. In the case that a historian wanted to contradict criticism, he or she had to show that the principles had been observed rather than that these principles were not valid. This is something that characterizes methodology but is not valid for the kind of substantive norms that formed the major part of the professionalism that Ranke had established, based on his kind of *Historismus*.

For the formation of the profession of historians, the debates on the application of historical methods were very important. A series of such debates took place in different countries in the first decades of the twentieth century. There was a big debate in Germany, called the *Methodenstreit*, on the correct use of methods in regard to any scientific activity. Generalization and interpretation were advanced as

alternatives. Karl Lamprecht, with his concept of social and cultural history, was rather lonely in Germany and is often regarded as defeated. In fact, part of the issue was the theories of *Historismus* and the alternative professed by Lamprecht. Another part dealt with methods and their application in the strict sense, where individualization (W. Windelband, H. Rickert, M. Weber, F. Meinecke, and others) was opposed to views based on structures and collectivities (W. Sombart, H. Pirenne, F. Simiand, and others) (Iggers, 1984). The struggle was reflected in other countries such as Finland, where Lamprecht's influence was strong. In other countries (e.g., the Scandinavian countries and China), there were other straightforward struggles about the use of methodological principles and their consequences for national history. The historians who advanced new and radical consequences of methodologies, which were already well known, had a program. They wanted to establish firm knowledge in history, a knowledge that was contrasted with guesses and conjectures, not historical relativism. In the United States, the focus of the debate was rather on the possibility of establishing objectivity (Novick, 1988).

Historical professionalism also increased through the ongoing specialization of all historical fields. In the beginning of the twentieth century, it was no longer the normal thing for a historian to take as the theme of an investigation the history of a country during a certain period. This had been quite usual in the middle of the nineteenth century, but in the first decades of the twentieth century this had changed. History had begun its separation into specific subfields, and economic, social, and cultural history was regarded as major examples of this. Specialized research institutes came into existence, and specialized journals were published: the *Economic History Review* from 1927, the *Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte* from 1903, the *Journal of Contemporary History* from 1966, and the *Vierteljahrshefte für Zeitgeschichte* from 1953. Similar journals were published in many countries with specific reference to the specialty in the national context. Specialization went further, chronologically and thematically. Investigations became very specialized in regard to field and object of study, and period of investigation. There was a dramatic change in the themes regarded fit for doctoral dissertations from the middle of the nineteenth century to 1920. Dissertations then were also outcomes of extensive archival research, where the author could and should show his or her (some women were achieving the doctoral degree at the time) acquaintance with sources and with the appropriate methods. Academic professionalism aiming at firm knowledge had found its way of expressing itself in such specialized studies.

At the same time as the second phase of historical professionalism in the sense of recognition among equals was triumphing in the interwar years, a distrust in the validity of its central notion, the idea of secure knowledge, was winning ground among historians. The philosophical direction of the *Historismus* had long since brought about doubts as to the possibility of obtaining security in historical research. Its proponents were influenced by the old tradition of hermeneutics, grown out from Bible studies, for acquiring a system of understanding. It contained two main requirements: preknowledge as the conceptual apparatus and direction of interest, and empathy as the means of acquiring an understanding of human thoughts and actions. Hermeneutics was regarded as a means to acquire more or less probable statements on the past, and the most general formulations included an ambition to maximize the probability through research. Collingwood's *The Idea of History* (1946) and Hans-Georg Gadamer's *Truth and Method* (1960) were influential in Britain and Germany respectively, and their works were complemented by the Frenchman Paul Ricoeur's *Time and Narrative* (1983–85).

Common to these works was that many historians accepted them as important foundations for the work of the historian. This meant that a new professional identity arose among some historians, conflicting with the earlier established group identity based on firm knowledge. As long as a basic norm in the hermeneutical camp was to increase the probability of historical statements through empirical research, the conflict could be kept within close bounds. After the 1980s, this was no longer possible. Various theoretical directions have taken the relativistic claim further. The debate in the 1980s and 1990s has gone out from Hayden White and his rhetorical analysis of historiography (White, 1978). The analyses of his standpoint have been numerous, above all in the United States, and have led to a variety of relativistic positions as regards the theory of history based on the assumption that history is basically a rhetorical and esthetic discipline. At the same time, in Europe, postmodernism has influenced other philosophers of history. A far-going relativism in different forms thus has more or less superseded the earlier basis of professional identity among historians.

At the same time as the idea of firm knowledge became questioned, the emphasis of professionalism was moved from the basis of methodology to the field of what was historically important. Social theories in the broad sense of theories of the social sciences had for a long time occasionally been used by historians. Braudel's book on the Mediterranean world from 1949 was breaking new ground in this respect. More regularly, historians have made models of important or interesting history the foundation of professionalism (or professional schools) from the 1960s onward. In economic history, it was already earlier the rule to rely on and use theories of economics, but theories of management and organizations and sociological theories were used to a large extent by historians in historical studies only in the 1970s and 1980s and more specifically Marxism in the 1970s. The professionalism of economic historians has come to rely on the ability to apply such theoretical instruments as well as specific economic (statistical) methodology. The analysis of social structures and social dynamics has also developed through the use of social theory. This approach had one of its origins in the Annales circle, then most often directed toward demography and geography and their social consequences. More explicitly, social science theory in general, including sociological and organizational theory, was proposed as the proper instrument for historical research by the so-called Bielefeld school, consisting of a group of historians who had some relation to the University of Bielefeld in the 1970s.

What they proposed was in line with what had been done by several American historians earlier, such as Merle Curti and Stephan Thernstrom, but their efforts had not been coordinated into a program. The Bielefeld historians advanced the concept of a 'historical social science' (Kocka, 1977; Wehler, 1980). This type of history found much appeal in the 1970s

and 1980s. Although parts of this enthusiasm for social sciences were criticized later, it is rather the theories used than the close link to social science (including social anthropology, which found growing appeal among historians) that have met opposition. The use of social science theories has thus been one source of professional identity among historians in recent decades.

All through the twentieth century, historical professionalism has also been challenged from political quarters. Autocratic regimes all over the world have tried to turn historians into docile instruments for the propaganda of the ruling ideology. Many have suffered for their professional ideals; others have accepted the norms of the state instead of the norms of the profession (Baets, 2009).

By the early twenty-first century, when historians have tried to base their professionalism on interpretative theories, methodological rules, and social science theories, all without general acceptance, the history of historiography seems to have met a new interest. Different standpoints to historical knowledge may unite in the interest in investigating the history of historiography from different angles, and it is equally important for all different standpoints. The role of this disciplinary self-understanding for a renewal of professionalization should not be overrated, however. The history of the discipline cannot meet the requirement of providing the norms through which a closure can be upheld against nonprofessionals, and as regards norms there is no unanimity.

Historical professionalism has developed in stages from Rankean *Historismus*, to methodological claims to find a firm historical knowledge, then further to fields of importance. No single normative basis is currently prevailing, and the frail identity of the profession seems to rely on the quasi-theoretical field of its own history.

Abstract

History as a discipline is a continuation of extradisciplinary forms of dealing with the past and has therefore never enjoyed a monopoly on its representation. Moreover, within the discipline there has always been a plurality of representations competing with one another. This article traces the modern problem of the narrative representation of history to its origins in the Aristotelian and the rhetorical traditions. The same goes for the modern question whether historical narratives can be true.

The modern doubts as to the practical functions of history are also traced to its origins. Although traditionally history's function was conceived of as pragmatical (*historia magistra vitae*), this idea presupposed that the past was basically similar to the present and the future. Since the rise of modernity in the eighteenth century this presupposition increasingly lost its plausibility. Because change became permanent, there was a rupture between the present and the past. Although this rupture was the very condition for the possibility of the 'disciplinization' of history, it rendered traditional pragmatical conceptions of history obsolete. Nietzsche's distinction between the monumental, the antiquarian, and the critical functions of history – taken over by, among others, Michel Foucault – is presented as a solution to the practical problem that still has validity.

Introduction

History as an institutionalized, academic discipline is a continuation of extradisciplinary forms of dealing with the past and, therefore, never enjoyed a monopoly on its representation. Narrative representations of origins – be it in the form of myths, legends, religions, or ideologies – are found in most cultures. These different forms of representing the past offer collectives an *orientation in time*: they give a *meaning* to the present by locating the present on a time axis between a future and a past.

Next to the variety of disciplinary forms of historical representation (Stern, 1970; Kelley, 1991; Lorenz, 1997), these extradisciplinary representations of history still exist, often competing with another and with disciplinary history. The problem how to demarcate the extradisciplinary from the disciplinary ways of dealing with the past – including their functions – has therefore haunted history as a discipline from its very beginning. Traditionally, the discipline's identity has been based on its *truth claim, based on its critical methods* and its *archival foundation* . This article will only deal with the disciplinary representations of the past in the West. It will *only* take extradisciplinary representations into account in order to cast light on the origins and the official borderlines of the discipline (Fain, 1970; McNeill, 1986).

Historical Representation and Its Function as a Historical Problem

Although the concept of representation has a clear-cut meaning in philosophy – that of a picture, in which the *structure* of the pictured phenomenon is *maintained* (Mormann, 1997) – in history the term is usually used as an equivalent of concepts like *image* or *construction*. In titles like 'The representation of Hitler in the US press, 1933–1945' or 'The representation of the Black Woman in the literature of the Antebellum South,' historians emphasize the constructed and interpretative character of historical reconstructions: history cannot directly be presented, but is *re*presented by the historian in language. This emphasis is rooted in an awareness that historical representations are *no mirror images* of history itself and is usually accompanied by an awareness of the fundamental *plurality* of historical reconstructions. At the same time, it is sometimes accompanied by an awareness of the *practical* functions (or the *politics*) of representation.

For the consciousness of this 'representational' character of history, two developments were crucial. The first development was the conception of history as an *object of knowledge*, independent of its individual representations. According to Koselleck, this development originated in Europe, in the mid-eighteenth century, when history as a process – *historia* – was first distinguished from the traditional *historiae*, i.e., the *stories* told about the past.

History could only be conceived of as an independent object of knowledge when it was no longer regarded as a binding *tradition* or as a practical *craft* belonging to literature or rhetoric, i.e., as the art of telling (his)stories in order to persuade a public, as had been the case in Europe from classical antiquity until the mid-eighteenth century. And history's functions only developed into a problem after the traditional idea, that past experiences were relevant for present purposes and that histories could teach by example what to do and what not to do (*historia magistra vitae*), began to loose its plausibility. 'History' thus is the direct product of the idea of 'progress' and of 'modernity.'

The second development, that promoted the awareness of the representational character of history, was the 'discovery' of its *perspectival character* during the Enlightenment. Although the possibility of multiple stories about the same events was known already – and a central concern of rhetorics – Enlightenment historians were the first to recognize explicitly that the historical representations *necessarily* vary with the *perspectives* of the historians and with the *development of time*. The Enlightenment also stimulated the tendency to identify cognitive, scholarly activity with *empirical* disciplines, which was a consequence of the competition of the *Geisteswissenschaften* with the modern natural sciences (Scholtz, 1991; Momigliano, 1990).

Koselleck dates the fundamental change in the relationship between Europeans and their sense of the past halfway through the eighteenth century, according to Pocock these changes had already started in the seventeenth century (Koselleck, 1979; Pocock, 1962). The traditional idea of a continuity between the past, the present, and the future was gradually replaced by the experience of *permanent and 'progressive' change*, so typical of modernity (Scholtz, 1991; Hardtwig, 1990). Because everything was changing all of the time, the past turned into a 'foreign country' (Plumb, 1973; Lowenthal, 1985; Rüsen, 1983–89).

Early in the nineteenth century, this experience of *difference* between the past and the present would lead to the association of history with the notions of *non*recurrence and *non*-generalizability, later expressed in the concepts of *uniqueness* and *individuality*. *History*, thus, came to be conceived of not just as random change through time – which could be cyclical and thus repeatable – but as *change as a process of directional and irreversible development*.

With the emergence of this specific new sense of the past, the stage was set for the development of history and the social sciences into separate disciplines. The object of history was increasingly identified with *non*recurring phenomena in the human past, while the social sciences were identified with recurrent phenomena in the human present. Because recurrence is a precondition for generalization and thus for (structural and processual) theories, history and theory gradually turned into opposites, excluding one another. Thus the idea was born that the forms of representation in history differed fundamentally from those in the social sciences. While historical representation was usually characterized as *time oriented* and as *narrative*, social scientific representational forms were characterized as *analytical* and *theoretical* (Meran, 1985; Burke, 1992; Lorenz, 1997). The modern question of narrative in history was thus born in the eighteenth century as a concomitant of the rise of modernity.

The Classical Roots of the Modern Debate (1): The Aristotelian Heritage

Both the Enlightenment conception of history and its critique in Herder and in later Romantic thinkers – the two conceptions of history that still define the terms of the modern debate – must be viewed in the context of Aristotelian philosophy, because the Aristotelian definitions and distinctions of disciplines were still very influential in the eighteenth century (Aristotle, 1963).

In Aristotle's (384–322 BC) philosophy, there is a basic distinction between empirical knowledge of singular facts and universal knowledge of general facts. Concrete, empirical knowledge just formulates the *contingent* and *particular* characteristics of its object, while theoretical knowledge formulates its *necessary* and *universal* characteristics. These latter characteristics are viewed as *recurrent* and *unchanging* and were therefore limited to the domain of *nature*. Theoretical knowledge was therefore limited to the domain of nature too. Theoretical knowledge, according to Aristotle, does not only inform us *what* reality looks like, but also *why* this is the case: theoretical knowledge is always *explanatory* knowledge, because it informs us about the *causes* of what happens. Therefore explanations in science are causal explanations and are ideally based on theoretical knowledge. This idea would dominate later philosophy of science in the form of positivism from Auguste Comte to Carl Hempel (Meran, 1985).

Within Aristotelian philosophy the domain of human activity or *culture* (praxis) held a fundamentally different status from nature, because contingency, particularity, and change characterize the first domain. This domain, therefore, was *not* open to theoretical knowledge and to scientific explanation *in principle* ('*de singularium non est scientiae*,' as Duns Scotus wrote in the thirteenth century). History, according to the Aristotelian system, belonging to the domain of culture, could never be regarded as a science and was located in the domain of *practical* knowledge, more akin to poetry (including literature).

Although both poets and historians dealt with the same phenomena, i.e., *human actions* and *events* (albeit respectively in verse and in prose), history only dealt with what was *real* and poetry with what was *imagined*. The historian, according to Aristotle, "describes what happened" while the poet "describes what can happen" (Aristotle, 1963: p. 419). This distinction was later codified in the distinction between the *res factae* (Latin: res = affairs; factae = done) or 'things done,' which was the domain of history, and *res fictae* (Latin: fictae = imagined), which only concerned poets.

The duty of the historian to stick to the facts and to tell the *truth*, the *whole* truth and *nothing but* the truth, derived mainly from the model of Thucydides. It received its canonical formulations in Cicero (106–43 BC) and Lucian (*c*.AD 125–200), who also linked truth in history directly to *impartiality* by avoiding moral blame and envy (*sine ira et studio*). The German historian Leopold von Ranke (1795–1886) would only repeat these classical ideals in the nineteenth century, with great force and effect (Iggers, 1997).

According to Aristotle, the poet enjoyed a 'constructive liberty' not shared by the historian. While the unit of the historian is defined by what had happened to specific subjects at a specific *time* at a specific *place*, the unit of the poet was *not* defined in such a way. In poetry, actions and events are put together by a unit of *meaning*, that is by constructing a whole with a beginning, middle, and an end, held together by a *plot*. The parts of the poetic unit all fulfill a function in – i.e., derive their meaning from – this whole. Because of its constructive quality, Aristotle held that poetry was more philosophical than history. This characterization was also based on the idea that poetry – for instance, tragedy – was concerned with *general* problems – types – and not only with particulars, like history.

The Aristotelian definition of history would define the parameters of the debates on historical representation up to the present. The *opposition of nature and culture* and the identification of nature with necessity and repetition, and culture with contingency and change, have defined the methodological battlefields in the philosophy of history. This opposition linked nature to (universal) theory while excluding (particular) history from theory a priori. As influential has been the *opposition of poetry and history* and the identification of history with the domain of the factual in opposition to the domain of fictionality.

Last but not least, the Aristotelian *opposition of historical units and poetical units* has put the *relationship between chronological*

and narrative ordering of events on the agenda of the philosophy of history i.e., the relationship between chronology and narrative. This opposition raised the question what narrative explanations are and how they relate to causal explanations.

The Classical Roots of the Modern Debate (2): The Rhetorical Tradition

Another fundamental root of the modern debate on historical representation can be traced back to classical *rhetoric* (Koselleck et al., 1982). Accounts of the past were dealt with by classical authors like Aristotle, Cicero, Lucianus, and Quintilianus (*c*.AD 35–96) primarily in the context of rhetoric, especially *forensic rhetoric*, i.e., rhetoric used to persuade a judicial court. So, the problem how to compose and write an account of the past was primarily dealt with as a problem in a *communicative* context and not as a *cognitive* problem, as was the case since the nineteenth century. Therefore the question how to produce a *convincing* history loomed larger than how to write a *truthful* history – which in turn explains why rhetoric later acquired a doubtful reputation until it was officially expelled from the scholarly domain by Descartes, only to return in the late twentieth century in the train of postempiricism and post-positivism (Nelson et al., 1987). This origin in forensic rhetoric also explains why the domain of history was identified with the domain of *human action*.

Now to be convincing, according to rhetoric, truth may help, because Plato argued that true arguments are the most convincing. Quintilianus, however, later pointed out that truth as such was neither a necessary nor a sufficient condition for being convincing. Being *convincing* is directly related to being perceived as *probable* rather than as being factually *true*, because some truths are hard to believe. In order to be convincing, according to rhetoric, past action primarily must be explained in (motivational) terms *understandable* and *plausible* for the *audience* addressed. Therefore, the reconstruction of past actions was basically conceived of in the rhetorical tradition as an act of *translation* of factual information by a speaker, who has a specific *aim* and who addresses a specific *audience*.

The rhetorical emphasis on probability instead of on truth was a consequence of its focus on *communication* and the awareness that factual truth is not a communicative category. It did *not* imply any plea for blurring the distinction between facts and fiction in history, nor the idea that truth in history fulfilled no practical function. To the contrary, the truth of the past was sought after, because only *true* accounts of past actions were *useful* as *exempla* for later generations (Momigliano, 1990; Hay, 1977). History was thus usually regarded as *inherently pragmatic* for some 20 centuries until the presuppositions of this pragmatic conception lost their plausibility with the rise of 'modernity' in the second half of the eighteenth century.

The Modern Debate on Historical Representation (1): The Problem of Narrative

Basically, the theories of historical representation developed since the eighteenth century can be classified on basis of their relationship with the Aristotelian and the rhetorical characterizations of history. There is a genus of theories, that can be seen as a continuation of Aristotelian theory, and there is a genus of theories, that opposes Aristotelian theory. Both genera contain several species.

The first genus consists of theories that have transformed the Aristotelian analysis of *poetical or literary narrative* into theories of *historical narrative*. According to these theories, historical narratives are structured by plots (P. Ricoeur; P. Veyne; H. White; D. Carr), colligatory concepts (W. Walsh), configurational ideas (J-.G. Droysen; L. Mink), or metaphors (F. Ankersmit). This view implies that historical narratives are *not* structured by a chronological order; instead they are structured by linguistic instruments that synthesize chronologically disparate elements into a *synchronic unity* (as, e.g., is done by concepts like 'The Enlightenment,' 'feudalism,' or 'imperialism'). Narratives, thus, are fundamentally different from chronologically ordered historical representations, such as chronicles and annals.

The *fundamental* difference between literary and historical narrative, according to most of these narrative theories, is the difference between fiction and fact: while the construction of literary narratives is only restricted by what is *plausible*, historical narratives are restricted by what is factually *true*. Therefore, history could and did claim a scholarly status in being empirical in the broad sense of a *Wissenschaft*.

This position was first developed by the Historical School from Niebuhr and Ranke onward and is philosophically legitimized by historicism that posits a fundamental connection between the narrative form of representation and the notions of time and of individuality. The basic idea is that narrative is the linguistic medium, which shows how a phenomenon (a person, nation, idea, etc.) develops its defining characteristics – its *identity* or *individuality* – in time, just as a biography shows how an individual has developed its identity in time (Lübbe, 1977; Veyne, 1978; Ankersmit, 2012). And although most narratives appear to follow the natural flow of time, it is, in fact, the other way around: the central idea of a narrative (e.g., the Enlightenment, the Age of Revolutions, etc.) determines which temporal units and orders (periodization, etc.) are the relevant ones for the narrative in case. Narrative time is thus always *constructed* time. Droysen formulated this insight some 140 years ago (Droysen, 1857).

Within this first genus of narrative theories, there are several species that show important differences among each other. The first species, exemplified by Louis Mink, Herman Lübbe, and Frank Ankersmit, has developed the argument that explanation by narrative is *sui generis* and is logically independent of causal explanation. All members of this species hold that the *narrative mode of representation* is *explanatory in itself*.

The second species, exemplified by Arthur Danto and Jörn Rüsen, holds that explanation by narrative, although different from lawlike explanation, is based on causal explanation nevertheless. The narrative mode of representation is analyzed here as a set of *causal chains*.

A third species of narrative theories, exemplified by Paul Ricoeur, David Carr, and Paul Veyne, has developed the argument that historical explanation has a narrative form and a plot structure. Ricoeur and Carr, moreover, argue that human experience itself is narratively structured and that there is an *a priori fit between human experience and narrative explanation*.

Both human individuals and communities can be said to have the same narrative form of self-constitution, because their identities can only be represented in the form of narratives.

Whatever their differences, all of these three species of narrative theories regard narratives primarily as explanatory schemes. All three try to answer the Aristotelian question how narratives explain, if not straightforward causally.

A fourth species of narrative theories is not primarily focussed on issues of *explanatory logic*, but on the *rhetorical problem* why narratives are regarded as *plausible* and *convincing*. Ann Rigney, and Hayden White in his *Metahistory*, exemplify this type of narrative theory. First, White argues that all historical narratives fulfill an ideological function, aimed at specific audiences. Second, he argues that historical narratives contain one of four literary plot structures: comedy, tragedy, satire, or romance. Third, he argues that all history can be emplotted freely in these four manners. Narratives are accepted by an audience as probable and as plausible, according to White, when the narrative plot structure and its ideological implication are *recognized* and *accepted as such*.

The acceptability of historical narratives, according to White, is thus *relative to audiences* and *relative to ideological aims* and *not* only dependent on the 'objective' truth of the factual statements in the narrative. In this respect, White's theory has a rhetorical ring, although his fixation on plot structures is at the same time Aristotelian. However, on the issue of narrative truth, White deviates fundamentally from both Aristotelian and rhetorical presuppositions. Contrary to Aristotle, he blurs the borderline between fact and fiction in history by stating that historical narratives are 'fictions of factual representation.' Consequently, according to White, there are no epistemological grounds for preferring one historical representation over another, only political and aesthetic ones. So, along with rhetoric, he holds that plausibility bears no necessary relation to truth. However, contrary to both Aristotelian and rhetorical theory, White severs the crucial link between research and composition of historical narrative: the composition of narratives is not treated as following from – and restricted by – research, but as a fully independent process (Paul, 2011).

The second genus of theories of historical representation somehow opposes Aristotelian theory. Historically this genus derives from eighteenth-century Enlightenment *conceptions of history*. Contrary to Aristotle, Enlightenment historians like Voltaire, Condorcet, and Chladenius, held that history could be both *theoretical* – in the sense of containing knowledge of a general character – and *scientific* – in the sense of being empirical. 'Theoretical' or 'hypothetical' history was thus claimed as a legitimate 'scientific' project, in which 'theory' and empirical knowledge could be integrated. Theoretical knowledge was no longer exclusively identified with the domain of nature and no longer exclusively interpreted as knowledge of what is necessary and universal. All knowledge of a general character was regarded as theoretical, including empirical generalizations and theories of the middle range. In the twentieth century, this type of position has been defended by the proponents of the *conception of history as a social science*, who conceived of history as a *mix* of particular and general characteristics. As the general characteristics could be theorized, they emphasize the importance of *theories* and *models* in historical reconstructions (Wehler, 1973; Kocka, 1977; Tilly, 1981; Burke, 1992; Iggers, 1997). This type of representations, being explicit about the concepts and arguments used, is often called *analysis* instead of narrative, emphasizing its affinity to the social sciences. This happened especially when 'traditional' history and its function were seriously questioned between 1960 and 1980.

The Nineteenth-Century Origins of the Modern Debate on the Functions of History

From classical antiquity until the eighteenth century the pragmatic presupposition that past experience was meaningful for present purposes was not questioned seriously, nor that the (empirical) truth coincides with the (ethical) good. From the end of the eighteenth century onward, however, historians and philosophers began to doubt the salutary nature of history and therefore the function of history: when history is no longer experienced as a meaningful and salutary process, what good is the study of history then? Nietzsche's all too nasty question in *The use and disadvantage of history for life* (1874), whether the study of history had *any use at all*, was the logical endpoint of this vanishing faith in history.

European historians basically countered these doubts by two strategies of demarcation. Firstly, by attempts to enhance the scholarly status and 'objective' credentials of history by increasingly expelling the rhetorical and artistic dimensions from its disciplinary domain. An increasing tendency to conceive of history as a *Wissenschaft*, opposed to *Kunst* or art, by identifying the discipline with its empirical research methods (*Forschung*) at the cost of the literary and artistic methods of its presentation (*Darstellung*), was the result (see Hardtwig, 1990; Scholtz, 1991).

Secondly, these doubts were countered by demarcating disciplinary history sharply from any *substantial philosophy of history*, especially from its Enlightenment and Hegelian variants (including Marxism), and from any *practical function*. In the famous words of Ranke, historians were not to pass any judgment on the meaning of the past – as the Enlightenment had done – but only 'to show what actually had happened.' By this demarcation strategy, the *reflection on the practical functions of history* was excluded from the disciplinary discourse and was expelled to the *philosophy* of history.

This epistemological demarcation had become possible, while history was professionalizing and attaching itself to the (usually: national) *states* both institutionally and financially (Berger and Lorenz, 2010). Because both the state elite's and the majority of the professional historians presupposed that education in (national) history was essential for 'nation building,' the practical functions of history ceased to be a problem. The practical function of history was now conceived of as *indirect* – through individual and collective identity formation alias *Bildung* – rather than as direct through *exempla*. This view was also held by proponents of a 'contemplative' function of history, like Ranke.

The ideal of objectivity was silently identified in historical discourse with promoting the *practical* cause of the 'impartial' nation state. This identification was not seen as a problem, because in the dominant conceptions of history, the historical process *itself* was identified with the genesis of nations and

states. It would take two World Wars, before this identification turned into a serious problem due to an increasing lack of plausibility. Nietzsche's nasty question, until then comfortably put aside by many professional historians as 'philosophical,' had to be faced at last: what good is the study of history anyway?

Nietzsche's analysis and classification of the functions of history in *The uses and abuses of history*, although framed as a critique of the nineteenth-century discipline of history in Germany, has proved to be very fruitful up to the present day (Rüsen, 1983–89; Kocka, 1989; Hardtwig, 1990; Tollebeek, 1990) Basically, Nietzsche distinguishes three ways to deal with the past and three types of history that correspond with three different attitudes and basic needs of human beings. Therefore, history has three basic functions that serve as mutual correctives and cannot be reduced to each other.

The first way to deal with the past is pragmatic, as an active *acting* being. Actors may address the past in search of examples, which, according to Nietzsche, deserve imitation. The past addressed in this way is treated as 'a collection of monuments.' That's why Nietzsche calls this pragmatic type of history *monumentalistic history*.

The second way to deal with the past is full of piety, as a *contemplative* being, when one is looking for one's roots in the past in search of one's identity. The past addressed in this way is treated as ' a collection of antiquities' or as 'a museum'; therefore, this 'pious' type of history, i.e., history just for the sake of the past, is labeled *antiquarian history* by Nietzsche.

Because man is not only directed toward the past, but also toward the future, it is impossible always to treat the past as a 'museum.' In order to create something *new* it is necessary to break with the past to some extent and to replace it. Therefore, it is also necessary to address the past in a critical way, as something to be criticized as fit for replacement. This type of handling the past, which Nietzsche compares to 'cutting one's roots loose with a knife,' is called *critical history*.

All three types of history have their own type of dangers and deficiencies that can only be remedied by history of the other types. Monumental history, for instance, tends to equalize the past and the present and to be very selective, obliterating differences and rendering huge parts of the past, unfit for the monumental function. This tendency can only be counteracted by the antiquarian impulse, which in turn suffers from 'historical myopia' and from a 'blind drive to collect.' This tendency, in turn, can only be counteracted by the critical impulse, which in turn must be held in check by the other two in order to prevent critical history from degenerating into a war against one's past.

Historiography can be seen as the combined product of these three impulses, in varying mixes. Disciplinary history since the nineteenth century, however, has usually – although not exclusively – embraced the antiquarian self-image and legitimization, because the recognition of both the monumentalistic and the critical approaches to the past would raise the problem of its practical functions and its claim to 'objectivity.' In accordance with this contemplative self-image of most historians, the antiquarian presentation *of identity* – i.e., the narrative reconstruction of the genesis of individuality in time – is usually presented as the discipline's only practical function. As in Nietzsche's time, the monumental and the critical functions of history are usually not discussed within the disciplinary boundaries (Angehrn, 1985). At times, however, for example in the 1970s, the situation has been different, because of an influential number of 'critical' historians in the profession (Kocka, 1989).

Symptomatic of this state of affairs is that recently the monumental function of history has been delegated to a separate domain, i.e., the domain of *collective memory* and of *lieux de mémoire*. The same holds for the critical function of history that is central to projects like gender history, postcolonial studies, and Foucault's critical history (which replaces the Enlightenment self-image of the West by an image of a disciplined 'carceral society'). These forms of critical history were often *not* regarded as belonging to the domain of history proper or are at best tolerated in its margins (Foucault, 1980; Scott, 1988).

Mainly in one historiographical domain – that of the *Holocaust* – reflection on the functions of history has included both its critical and monumental functions, because the very possibility of the antiquarian approach is fundamentally questioned here. Not accidentally, increasing skepticism concerning future 'progress' – and thus of 'modernity' – is causing increasing doubts as to the object-character of 'the past.' Historical representation *as such* has turned into a problem, because it is doubted whether the traditional categories and procedures of historical representation in order to 'objectify' the past, can function in this unimaginable domain where the very temporal distinction between past and present is problematic. Some hold that psychoanalytic categories like trauma, repression, transfer, splitting off, and working through are more apt to characterize the relationship between the historical representations and represented historical reality. Others have suggested that the 'overwhelming' dimensions of the Holocaust can better be characterized through the notion of the *sublime* (Friedländer, 1992; LaCapra, 1994; Frei and Kansteiner, 2013).

Mainly in this historiographical domain, the discussion about the functions of history is directly connected to the discussion on historical representation and its limits. From there, the discussion is being continued concerning some of the discipline's fundamental presuppositions, such as the presupposition that the past is 'at a distance' from the present and the future – and thus no longer 'present.' Along this route the debate is nowadays reflecting on the assumptions that gave birth to history as a discipline more than 200 years ago (Lorenz and Bevernage, 2013).

Abstract

Since the institutionalization of history as a distinct academic discipline in the nineteenth century, the truth claim of history has basically been founded on some idea of the historical method. What was considered to constitute this 'method' of history, however, has varied considerably over competing conceptions of history and over time. The various conceptions have been connected to different theories about what constituted history *itself* (as an object) and what was considered as reliable *knowledge* of this object (if possible at all). Therefore, the debates about the methods of history have always been embedded in debates about theories of history – and vice versa. As natural science was often considered to be the methodological opposite of history, images of natural science have also influenced the debate about historical method and theory. This article traces the main course of these debates since the nineteenth century and offers some ways to classify them.

Introduction

Since history turned into an academic discipline in the nineteenth century and since professional historians claimed a privileged epistemological status for their approach vis-à-vis nonprofessional approaches to history, debates about the role of methods and theories in history have followed a clear pattern. In periods of relative uncertainty and of crisis about the status of history as a distinctive academic discipline – such as 1880–1920 and 1965–85 – many historians participate in these debates. In those periods, *Methodenstreit* is more or less intense and visible, while in periods of relative certainty and of academic recognition, this type of debate usually recedes into the background. So, seen from an *historical point of view*, reflection on the role of methods and theories in history is in a sense a symptom of crisis – at least outside the small group of historians and philosophers who *permanently* reflect on history in their capacity as philosophers of history. This direct connection between a 'reflective mood' among professional historians and their sense of professional uncertainty makes sense because, as will be elucidated below, method and/or theory have usually been presented as the discipline's *cognitive foundations*, especially its claim to produce 'objective' knowledge of the past. Therefore doubts and debates about method and theory in history are always doubts and debates about the discipline's cognitive status, its academic credentials and its claim to objectivity.

Seen from the *point of view of the sociology of science*, debates about the role of methods and theories in history have usually been directly linked to battles waged by the proponents of different conceptions of history for academic legitimacy and supremacy, that is, for academic recognition and reputation. In periods of serious competition for 'intellectual capital' (Bourdieu) between several competing factions, operating within the same 'academic field,' debates about methods and theories in history have been intense. This not only holds true for history, but also for other social sciences such as sociology, economics, psychology and, therefore, is a characteristic of pluralistic or polyparadigmatic disciplines.

Characteristic for the periods of increased interest in theory and method is also an increased interest in the history of the discipline from both an intellectual angle and an institutional angle. This interest in disciplinary history is usually motivated by a desire to locate the origins of the preferred conception of historical theory and method in the discipline and to generate academic credentials by locating prestigious founding fathers or precursors of the preferred conception in the discipline's pedigree – the closer to 'the origins,' the better. Therefore, in history, an increased interest in the history of history writing, alias in *historiography*, can usually be observed alongside an increased interest in theory and method: theoretical and methodical reflections usually are accompanied by reflections on the origins, nature, and variety of historiography.

Seen from a *philosophical point of view*, debates about the role of theories and methods in history often have a blurred character due to the vague philosophical status of the central concepts of theory and method. Therefore, some elementary conceptual clarifications are called for in order to answer the question why theory and method in history have turned into a heavily contested area at times since history turned into an academic discipline.

Theory and Method in History: Some Preliminary Distinctions

In discussing the role of theory and method in history it is necessary to introduce some basic distinctions. Due to the double meaning of history as *res gestae* and as *historia res gestae*, theory in history can refer both to *history as a process* and the *knowledge of that process*. Therefore the *first basic distinction* to make is the distinction between (1) *theories, that deal with characteristics of history as a process* (such as, for instance, Marx's theory of history as class struggle or Treitschke's theory of history as nation formation), and (2) *theories that deal with the characteristics of knowledge of history* (such as, for instance, that scientific knowledge of history has the form of lawlike knowledge or the form of concrete particulars). Theories of type (1) can be called *substantial* or *material* theories of history, while theories of type (2) can be called *cognitive* theories of history, i.e., theories of historical knowledge.

Cognitive theories of history can further be subdivided in (1) *epistemological theories* and (2) *methodological theories*, while substantial theories of history can also be subdivided in finer subsets. Substantial and cognitive theories usually have been interrelated, because presuppositions about *what* can be known

about the past are linked to presuppositions of *how* the past can be known. Substantial theories, for instance, that hold that the historical process is characterized by underlying mechanisms and regularities, analogous to theories of classical mechanics, have been interrelated with cognitive theories that posit that real knowledge of history implies knowledge of general laws. And the substantial theory that the historical process is characterized by a fundamental contingency and *not* by hidden regularities alias a 'motor' has been interrelated with cognitive theories that posit that real knowledge of history is knowledge of particular facts instead of general laws.

Substantial theories, in this way, not only have consequences for methodological positions, but also for epistemological positions. Substantial theories, that posit some kind of affinity or even identity of the knowing subject and the object of history in contrast with nature (as was the case with Hegelian idealism and its offshoots in historicism, such as Droysen's and Dilthey's versions of historicism), have usually been interrelated with methodological theories that posit a distinct kind of method for the human sciences – such as *understanding* or *Verstehen* or *interpreting* – in contrast with the methods of the natural sciences – usually defined as some form of causal or lawlike *explanation*. And these distinct methodological theories have, in their turn, usually been interrelated with distinct epistemological theories, linking methods of understanding to hermeneutic or phenomenological theories of knowledge and methods of explanation to empirical theories of knowledge. Before taking a better look at this terrain, however, it is first necessary to clarify the central *concepts* of method and theory as well as their interrelationships in history. When analyzed more closely, both method and theory in history appear to have a broad variety of meanings.

Historical Method(s): Concept and History

Analyzing the meaning of 'method' in history, it is useful to start with a clarification of the term 'method' in other disciplines first (J. Meran, 1985). In the mathematical sciences, it is common to refer to axiomatic-deductive, to infinitesimal and to inductive methods, meaning *a set of formal, technical procedures* in order to solve problems within a specified range. Outside the mathematical sciences, the meaning of method is usually far less defined. In philosophy, for instance, there is a long tradition referring to methods of all sorts, ranging from Descartes' *Discourse on method* to Kant's *transcendental method*, from Marx's *dialectical method* to Husserl's *phenomenological method* and to de Saussure's *structuralist method*, to name just a handful. These 'methods' in philosophy, however, do *not* constitute defined formal rules for specified ranges of problem solving, but constitute complex sets of ideas, concepts, and rules of thumb for analyzing specified domains such as scientific knowledge, the human consciousness, the history of mankind, the meaning of concepts, or the meaning of language in use or of language as a system of signs. 'Method' in philosophy, thus, is definitely *not* identical with a set of formal techniques, but a loosely circumscribed research program. This diffuse and nonformal meaning of method is also characteristic of the human sciences.

In history, the term historical method was first introduced in a systematic way in the sixteenth century by Jean Bodin in his treatise of source criticism, *Methodus ad facilem historiarium cognitionem* (1566). Characteristically, Bodin's treatise intended to establish the ways by which reliable *knowledge of the past* could be established by checking sources against each other and by so assessing the reliability of the information conveyed by them, relating them to the interests involved. Historical method was thus at the same time intended to defeat skeptical doubts with regard to the possibility of reliable knowledge of the past. Skepticism (alias historical Pyrrhonism) had been fed by a large quantity of scriptural forgeries parading as original historical documents, primarily produced by competing churches and nobles to back up their claims to rights and property. Therefore, the traditional claims to impartiality, truth and trustworthiness of historians, dating back to classical Antiquity, were no longer believed, and were now replaced by a claim to impersonal and intersubjective method.

This direct *relationship between history's claim to truth and method* would characterize all later treatises on historical method, although what was meant by method did change over time. In the eighteenth century, historians of the Enlightenment, such as Schlözer, included not only the source critical techniques as *the* historical method (*Forschung*) but also the way the results of historical research were synthesized into a textual whole (*Darstellung*) and presented to an audience. This broader conception of method had its roots in the classical rhetorical tradition and would only be rediscovered in historical theory from the 1970s onward. The German historian and historical theorist Johann Gustav Droysen (Droysen, 1857–1882) has become one of the pivotal historians behind this 'rediscovery' of the textual and rhetorical dimensions of history, because his treatment of historical method in the earlier and the later versions of his *Historik* embodies the transition from the broader to the narrower conception of historical method (Meier and Rusen, 1986; Nelson et al., 1987).

The larger part of the nineteenth and twentieth century would be dominated by the research-oriented conception of historical method of the so-called *Historical School* in Germany, led by historians as Berthold Niebuhr and Leopold Ranke. Their conception of history has long been regarded as the beginning of modern, scientific history, and harked back to the narrow conception of historical method, limiting the methodical character of history to source criticism (Grafton, 1997). The historical composition and presentation – the *Darstellung* – was no longer regarded as methodical and was now seen as the literary, artistic, or aesthetic component of history. Therefore, the question of whether history belongs to the arts or to the sciences could and did arise from the nineteenth century onward, a question that became part of the continuing *Methodenstreit* (F. Stern, 1970; Fay et al., 1998).

In the nineteenth century, during the process of rapidly increasing disciplinary differentiation and academic institutionalization, it became customary in the human sciences to identify disciplines with *one* specific method that was presented as the guarantee of its 'truth' and 'objectivity.' In this process, sociology was identified with *the* sociological method and history with *the* historical method. Canonical formulations of this conception of historical method can be found in E. Bernheims *Lehrbuch der historischen Methode* (Leipzig, 1889) or in Ch. Langlois and Ch. Seignobos *Introduction aux études historiques* (Paris, 1897).

Historical method in the nineteenth century usually referred to the techniques for conducting historical *research* on written materials, the so-called *sources*. These techniques – partially taken over from philology – were traditionally subdivided into three parts, corresponding with three subsequent steps in research: *heuristics*, that is the techniques for locating the relevant sources; *source criticism*, the techniques by which the temporal and spatial origins of the sources are established as well as their authenticity; and *interpretation*, by which the 'cleansed' information derived from the sources is put together by means of interpretation in order to infer 'what really happened.'

Usually a distinction was made between *primary* and *secondary* sources. Primary sources consist of the written material produced more or less contemporaneous with the object of research, ideally recorded by eyewitnesses (model: the official records of parliamentary debates). The time span between primary sources and what they represent is thus as small as possible, because distance in time is regarded as a major source of unreliability of the information conveyed. Secondary sources consist of records written a considerable time *after the fact* and not by eyewitnesses (model: 'hear say'). As the information in secondary sources is based on *other* sources, it is, at best, 'second hand.' Therefore, it is regarded as less reliable than primary source information. According to the dominant, Western conception of history since the nineteenth century, serious academic history can only be based on primary sources, because those are the only reliable source of information on the past. Therefore, the archives were usually considered to be the workshop of the professional historian.

According to the same nineteenth-century conception, nonscriptural or 'low' cultures were primitive *by definition* and simply had no history comparable with 'high cultures.' In this way the scriptural, source-based conception of historical method defined – and limited – the object of academic history to the history of 'high cultures,' especially the history of the West. It would last until the second half of the twentieth century before these biases in the very conception of historical method would be seriously criticized, especially by 'history from below' and by *postcolonial theory*. It dawned on an increasing number of historians that entangled with the history of 'the West' there was and is a history of 'the rest.' As a consequence, *global* and *world history* have been on the rise since the 1990s, using comparative and transnational approaches (Haupt and Kocka, 2010).

Another traditional distinction was that between *internal* and *external* source criticism. *Internal* source criticism is actually *textual* criticism, i.e., the hermeneutic procedures by which a text is reconstructed (if it is passed down in an incomplete form or in several variants) as a whole and the textual procedures by which authorship and textual authenticity are checked and its meaning established. *External* source criticism consists of those procedures by which a source is checked by information derived from *other* sources – written and material. The so-called *auxiliary sciences*, such as paleography, chronology, sillography, toponomy, numismatics, and diplomactics, usually play an important role in this phase when historians are dealing with older periods. And when modern historians are dealing with nonscriptural, oral cultures or with cultures, that left few or no scriptural traces, archaeology and anthropology often function as auxiliary science. Only in the course of the twentieth century did reference to *multiple methods* within *one* discipline became the rule, thereby reopening the problem of truth and objectivity and paving the way for a new wave of skepticism. For if *the* method can no longer be regarded as *the* procedural guarantee for the truth and objectivity of the discipline, what could? So an influential argument ran (R. Bernstein, 1983; Megill, 1994). Recognition of plural methods within one discipline, therefore, has often been regarded as a threat to the discipline's academic credentials.

From the late 1960s onward, the process of methodological differentiation within all of the human sciences took an unprecedented pace, leading to a temporary fragmentation of most disciplinary fields and a questioning of most traditional disciplinary boundaries and self-definitions. Significantly, the new, 'polyparadigmatic' self-image was at the same time regarded by many as a *crisis* of their discipline. This also held for history in the 1960s and 1970s regarded by many as one of the social sciences (Novick, 1988; Appleby et al., 1994; G. Iggers, 1997). Later, the changes in styles of 'doing history' were often characterized in terms of an ever increasing number of 'turns' (linguistic, cultural, spatial etcetera) (American Historical Review, 2012).

Historians identified the quantitative method, the biographical method, the comparative method, the ideal-typical method, understanding as a method ('Verstehen'), the causal method ('Erklärung'), discourse analysis as a method, the micro-historical method, and to a psychoanalytical method in history. Other historians claimed that the concept of method had become severely overstretched, holding that most advertised *methods* in fact were *theories* about historical knowledge, that could only be checked by *the* historical method of source criticism. Therefore, a closer look at the relationship between historical method and theories is necessary.

Theories of Historical Knowledge (1): Empiricism and Antiempiricism

The connections between historical method and historical theory can be located both on the level of *epistemology* and on the level of *methodology*. As epistemology is the theory of knowledge, historical epistemology deals with the theory of historical knowledge, i.e., the conditions of its possibility, its range, sources, and foundations. Basically two epistemological positions have been defended in relation to historical knowledge from the nineteenth century onward, empiricism and antiempiricist idealism.

The problem whether and how it is possible to acquire knowledge of other minds, i.e., the *mental states of others*, such as thoughts and intentions, separated from the knowing subject in both time and space – the typical problem of the historian – has been a fundamental one since the mid-nineteenth century. According to *empiricism*, mental states could only be known as far as they correlated with empirically observable epiphenomena. The empirical dispositions or expressions *of* other minds are seen as the only access *to* other minds (Hempel, 1966).

The proponents of phenomenological and hermeneutic views (*hermeneutics* is the theory of interpretation, originally of

text interpretation), to the contrary, have always affirmed this possibility of a nonempirical access to mental phenomena. Phenomenology claimed *introspective methods* as the access to the mental universe; hermeneutics, far more influential in the theory of history than phenomenology, claimed that *'reading' other minds* could be conceived of as *analogous to reading texts*.

The fundamental cognitive activity in all hermeneutic theories is the *interpretation* of meaningful symbols and symbolically structured phenomena (like actions and cultural objects), whereas all empiricist theories regard the *observation* of objects as the fundamental cognitive activity. Just as it is possible to know the ideas expressed in a text by reading and interpreting, it is possible to know the ideas expressed in actions and in all artificial objects by *inferring* the unobservable ideas from their observable expressions through *reenactment* and *interpretation* by the historian (Droysen, 1977; Dilthey, 1981; R. Collingwood, 1993). This possibility was guaranteed, according to the hermeneutic views, by the basic unity of mankind, implying the *basic unity* of subject and object of knowledge in the human sciences. Therefore each *Alter* was an *Alter Ego*, accessible through a process of intuitive identification and transfer in thought or idea (therefore idealism). So in historical epistemology, just as in the other human sciences, the basic divide between 1850 and 1970 has been the one between empiricist and antiempiricist, idealist positions. It would last until the 1980s, with the rise of postmodernism and its offshoots in the discipline of history, before the unitary presuppositions of hermeneutic theories would be seriously criticized and questioned. Western (White) Male was no longer accepted by all as the model of all mankind. This has led to a renewed emphasis on the basic diversity of knowing subjects and their epistemological and methodological relevance for disciplines like history (Scott, 1991).

Theories of Historical Knowledge (2): Unity vs Duality of Method

Between 1850 and 1970, this basic divide in the domain of epistemology roughly corresponded with the basic divide in the domain of historical *methodology*, i.e., the divide between the proponents of the theory of the *unity of scientific method* and the proponents of the theory of a fundamental *methodological dualism of the human and the natural sciences*.

Methodology as such aims at the *rational reconstruction* of the normative rules that are constitutive for a specific discipline and its development. Rational reconstruction, in contrast with historical reconstruction, presupposes that disciplinary practices and their development can be reconstructed in terms of *logical* and *empirical* arguments; this presupposition is, of course, an *idealization* of the rationality of real disciplinary practice, because apart from rationality, power and privilege also play their role in reality. Methodology abstracts from those nonrational factors in disciplinary life and aims to reconstruct the cognitive criteria and ideals, by which the practitioners of a discipline judge each other's products and evaluate their relative quality. Methodology, therefore, *presupposes* the existence of a basic cognitive consensus and rationality among the practitioners of a discipline. This presupposition, of course, has been criticized both for the natural as for the human sciences (Goodman, 1978; Rorty, 1986; Novick, 1988).

Next to the basic ideal of truth, other cognitive ideals of a discipline are reconstructed by its methodology, such as the *explanatory ideals* of the discipline and its *criteria of progress*. At this level the basic methodological divide between the proponents of the *unity* of scientific method and the proponents of the *dualism* of scientific methods must be located, because the divide revolves around the question of whether there is *one* explanatory ideal for *all* disciplines or not. This issue has dominated the methodological debates for more than a century since 1850 and is known under the labels of the *explanation vs understanding controversy* (Gardiner, 1959; Hausmann, 1991). According to the *unity of science view*, also often labeled as *positivism*, there was just *one* model or logic of explanation and of development for *all* empirical disciplines. Classical mechanics in the nineteenth century was usually considered to be the paradigm for all other disciplines, including human sciences like history. The only difference between the various disciplines was their *phase of development*. Underdeveloped disciplines (like history) showed little similarity to Newtonian mechanics while developed ones did. Immature disciplines only produced 'explanation sketches' (C. Hempel) that had to be developed into real explanations. The only difference between disciplines was thus a matter of scientific *maturity* and not a matter of explanatory *logic*.

Real *scientific explanation* boiled down to *subsuming an event* to be *explained under a general law*. Therefore, the event to be explained can be *logically deduced* from the general law in combination with the given circumstances (the so-called initial conditions) and is at the same time, given the law and the initial conditions, predictable. According to this view on the logic of scientific explanation, that is also known under the headings of the *subsumtion model*, the *deductive-nomological model*, or the *covering law model of explanation*, explanation and prediction in science are basically the same; explanation is really prediction in the past alias retrodiction. Scientific explanation, in this view, is showing why what happened, was – given the known laws and circumstances – expected to happen because it was bound to happen: explanation boiled down to show what happened was *logically necessary*. Given the fact that the general laws were usually (though not exclusively) interpreted as *causal* laws, formulating universal and invariant connections between causes and effects, scientific explanation was usually seen as causal explanation and *explanatory necessity* also as *causal necessity*: scientific explanation specifies the causes of what happened by formulating its causal determinations.

Now although this unitary theory of scientific explanation was amended and modified in time, in order to account for statistical and probabilistic forms of explanation in the natural sciences, its status was based on the *assumption* that 'positivist' theory at least provided an adequate reconstruction of *natural* science and its development from the seventeenth century onward. This assumption has been increasingly undermined by *postempiricist* and *postpositivist* philosophy of science roughly since the 1960s and 1970s. Both the empiricist underpinnings of the covering law model and its logical claims were undermined by historical examples, arguing that the supposedly paradigmatic cases in the history of science did not fit the basic logical models of philosophy of science. Therefore this 'turn' in

philosophy of science is often called the *historical turn*, because history was mobilized against explanatory logic (Lakatos and Musgrave, 1970). However, before examining the implications of postempiricism and postpositivism in philosophy of science for the opposition between classical unitary and dualistic methodological theories, an overview of the dualistic positions and arguments is called for.

Theories of Historical Knowledge (3): The Autonomy of History

The philosophical defense of the *autonomy of historical explanation* vis-a-vis the explanatory models of natural science usually has started off with a critique of the unitary claim. From Droysen and Dilthey, through Windelband, Rickert, Weber, Collingwood, and Gadamer, to White and Ricoeur, the argument has been developed that historical explanation is not only *empirically* different, but *logically* different from the covering law model. This claim of autonomy has traditionally been defended in three variants: an ontological version, an epistemological version, and a methodological version. The *ontological argument* for methodological dualism was first systematically developed by J.G. Droysen and later by R.G. Collingwood and his school. It usually harks back to Vico and Hegel, because it is based on an idea of a *subject–object identity* in history: in history, mankind confronts itself, and history, therefore, is basically the autobiography of mankind. History is fundamentally the process in which mankind *expresses* and *develops* itself in the form of diverse cultures; and because mankind has *made* history, it is capable of *knowing* history in a direct way, according to this argument, just as the writer of an autobiography knows the history in case in a direct way. Historians basically try to reconstruct cultures and the particular ideas expressed in its cultural practices (such as religions and rituals) and its material artifacts (such as its temples and sacred objects). When historians offer *explanations* for the past, they construct *intelligible and plausible connections* between the culture and the ideas expressed in it on basis of their research of the sources under consideration. When they succeed in this task, they offer an *understanding* of the phenomena under consideration (*Verstehen*). *Understanding history* is conceived of as basically similar to *understanding a text*; the major difference is that the texts of history have more or less disappeared and therefore must be reconstructed first on the basis of their traces by research. This type of intelligibility is possible, because in history man confronts man and therefore intuitive understanding is possible in contrast to the situation in the sciences of nature, where the knowing subject confronts an external object.

The intelligibility sought for by historians – *historical understanding* – is thus centered on *connecting ideas to their expressions in particular spatiotemporal contexts*, and proceeds by going back and forth between parts and whole in the so-called *hermeutic circle* or *spiral*. Historical understanding is therefore logically different from scientific explanation: the type of connections, which historians present, are not causally determined and cannot be deduced from general laws. *Historical* connections are *not necessary but contingent* connections, which always could have been different from their actual form.

Neither are they based on empirical observation, but on plausible *inferences*, based on critical research of the sources and on analogical reasoning. Historical understanding at best produced *plausible* and *probable* knowledge, and never *certain* or *founded* knowledge, as scientific explanation, based on sensory experience and logic presumably did. And being dependent on intellectual, interpretative *activities* by the historian, which could be trained but not formalized, historical understanding, thus, remained 'subjective,' i.e., embedded in the culture, time, and place of the historian. On the basis of this argument, Gadamer in his *Truth and Method* (1960) would radically historicize the idea of historical understanding.

The second type of argument in defense of methodological dualism is not ontological, but basically *epistemological*. It was first systematically developed by Wilhelm Dilthey and bears a resemblance to Droysen's argument, because it also harks back to Hegel's idea of a subject–object identity in history with its implied 'history as the autobiography of mankind model.' However, Dilthey does not ground historical method directly in the subject–object structure of the historical process *itself*, but in the *inner experience* ('Erlebnis') of historical facts as *mental facts*. The 'mental facts' of history and of other *Geisteswissenschaften* consist of feelings, thoughts, and strivings of human beings living in the past that are only accessible through the mind and the inner experience of the historian. Like Droysen, Dilthey posits that the historian makes the mental facts of the past intelligible as expressions of ideas, by putting them in a particular spatiotemporal context alias in a *Lebenszusammenhang*. And like Droysen, he contrasts historical understanding with scientific explanation by rejecting causal, lawlike reasoning for history, but unlike Droysen, Dilthey emphasizes the contrast of the 'inner experience' of the historian with the 'outer experience' of the scientist as the foundation of methodological dualism.

The third type of argument in defense of methodological dualism is of a *methodological* character. It is *not* based on an ontological claim that history deals with an object fundamentally different from nature, and *neither* is it based on an epistemological claim that the historical facts are different from natural facts, being accessible to an 'inner' way of knowing. According to the methodological argument, as developed by Windelband, Rickert, and Weber, *two fundamental ways of knowing or methodological approaches* can be distinguished that are connected by two fundamentally different aims or knowledge interests. The first way to approach an object is a *generalizing* method; in this case, one abstracts from the particularity of the objects of knowledge and tries to detect and explain its general characteristics. According to Windelband, this generalizing method was specific for the *nomothetic* sciences (Greek: nomos = law; tithemi = to posit), such as the natural sciences. The second fundamental approach of an object is the *particularizing* method; in this case, one abstracts from the general characteristics of an object of knowledge and tries to describe its specific characteristics. According to Windelband, this particularizing method was specific for the *idiographic* sciences (Greek: idios = particular; graphein = to describe), such as history. However, both the generalizing and the particularizing method are *independent* of the nature of their objects

of knowledge; nature can be studied in an idiographic way (for instance, in geology) and history can be studied in a nomothetic way (for instance, in developmental psychology). It all depends on one's methodological *interest*.

Rickert and Weber would develop Windelband's basic ideas by introducing the dichotomy between sciences of nature (*Naturwissenschaften*) and sciences of culture (*Kulturwissenschaften*). Rickert introduced the idea that knowledge interests behind disciplines were guided by *values* (*Wertbezogenheit*); Weber pointed out that values usually change through time. According to him the change of the guiding values behind the sciences of culture could explain why those disciplines did not accumulate knowledge in the systematic form like the natural sciences, and why they seemed to enjoy an 'eternal youth' (Weber, 1922). At best the sciences of culture could accumulate knowledge at the intermediate level *between* individualizing descriptions and universal explanations in the form of *ideal types*, according to Weber. He suggested comparison as the method at this intermediate level. Lübbe, Veyne, and Mink would develop the Weberian methodological position later, identifying history with the particularizing methodological interest (Lübbe, 1977; Veyne, 1978; Mink, 1987).

All in all, *different conceptions of historical method* are connected to *different theories of historical knowledge*. Since the characteristics of historical knowledge are usually defined in contrast with scientific knowledge as the major contrast class, theories of natural science are also presupposed in theories of historical knowledge. Fundamental changes in theories of natural science, therefore, affect theories of historical knowledge by *detour*. The rise of postempiricism, postpositivism, and the historical turn in philosophy of natural science, thus has undermined most traditional, classical defenses of methodological dualism in an indirect way by undermining the classical unitary model of science. A few remarks must suffice.

Postempiricism has effectively undermined the presupposition that scientific knowledge can ever be grounded on *certain* foundations in sensory experience. The opposition between grounded and certain knowledge on one side – traditionally attributed to the natural sciences – and inferential and probable knowledge on the other – traditionally attributed to the human sciences – has thus vanished. This opposition has been replaced by the insight that *all* sensory experience is guided and framed by concepts and theories. All empirical knowledge, therefore, is based on interpretative *activities* of the knowing subject because it is *theory laden*. Therefore, *all* knowledge is *fallible* and open to later *re*interpretations. Postempiricism, thus, has dissolved the presupposed absolute contrast between a 'subjective' kind of knowledge, based on interpretation – characteristically for the *Geisteswissenschaften*, the *Kulturwissenschaften*, or the historical sciences – and an 'objective' kind of knowledge, based on empirical observation and experiment, not in need of interpretation. Postempiricism has thus relativized both the distinction between theoretical knowledge and empirical knowledge, on one side, and the distinction between interpretative knowledge and empirical knowledge, on the other. It has, thus, brought *conceptualization* and *interpretation* to center stage in *all* disciplines (Skinner, 1985). Doing so, postempiricism has undermined traditional underpinnings of the idea of fundamentally distinct scientific and humanistic methods and the idea of a fundamental contrast between the 'objectivity' of science and the 'subjectivity' of the humanities. Both scientific domains aim at *empirical* argument and *intersubjectivity* (Megill, 1994; Oexle, 1998; Daston and Gallison, 2007).

Postpositivism, based on postempiricism, has in turn effectively undermined the presupposition that all scientific explanations can be reduced to one basic model, i.e., the subsumtion model of explanation. By discrediting this presupposition for *natural* science (Salmon, 1990), postpositivism a fortiori has discredited the subsumtion model for the humanities. Moreover, the fact that the explanation of mental states by nonmental states has not succeeded up to the present, has also discredited unitary views (Bohman, 1991).

In the theory of history, postempiricism and postpositivism have led to a renewed reflection on the nature of historical knowledge in *postmodernism* and in a renewed interest in approaches inspired by *literary theory*. After the classical science model was discredited, the roots of history in rhetoric and literature were rediscovered, leading to a renewed interest in the linguistic forms in which history is represented, i.e., in theories of historical *representation*. The postmodern vanguard, often identified with the *linguistic turn*, pushed both theory and method in history into the background, locating historical representation *beyond* epistemology and methodology, on the terrain of aesthetics, rhetoric, and politics (White, 1973; Megill, 1985; Ankersmit and Kellner, 1995; Fay et al., 1998).

This move, in fact, harks back to the *pre*methodical and *pre*disciplinary roots of history, cutting history loose from its claim to constitute a truth-seeking discipline and to produce 'objective' knowledge (Rüsen, 1983–1989; Lorenz, 1997). Nevertheless, the pendulum is already swinging back, leading to broader approaches of history that keep up the cognitive claims of the discipline based on *both* research (Forschung) and composition (Darstellung), while integrating the literary and the practical dimensions of history. Moreover, recently unity of science claims has returned in some forms under the banner of the so-called *digital humanities* that use tools provided by computing (such as data visualization, information retrieval, data mining, text mining and statistics). Therefore the present landscape of theory and methods in history shows even more variety than 10 years ago (Berry, 2012).

Abstract

Human Immunodeficiency Virus (HIV) infection, the cause of Acquired Immune Deficiency Syndrome (AIDS), has become a significant threat to global public health, faster than any previous epidemic. Recent decades have seen significant progress in the global HIV/AIDS response, largely due to increased availability of treatment and targeted efforts to decrease transmission and incidence. This article highlights HIV risk prevention strategies that have been developed, implemented, and demonstrated efficacy in reducing the risk of HIV infection among adolescents, women, men who have sex with men, and heterosexually active men.

Significant progress has been made in the global human immunodeficiency virus/acquired immune deficiency syndrome (HIV/AIDS) response during recent decades. Since 2001, new cases of HIV have been reduced by more than 50% in 25 of the worst-affected countries (UNAIDS, 2013). In 2012, there were approximately 2.3 million new cases of HIV reported globally, showing a 33% decline in the number of new infections from 3.4 million in 2001. The greatest declines have been observed in sub-Saharan Africa (25% between 2001 and 2011) and the Caribbean (42% between 2001 and 2011). During the same time period, the number of AIDS deaths also declined from 2.3 million in 2005 to 1.6 million in 2012, an accomplishment largely attributable to wider availability of antiretroviral therapy and the continuing decrease in HIV transmission and incidence (UNAIDS, 2012b).

Despite the progress made in the last decade, the burden of this epidemic continues to present a challenge to the global community in expanding and sustaining commitments to combating HIV. The 2013 UNAIDS report estimated that there were approximately 35.3 million people living with an HIV (PLHIV) infection in 2012 (UNAIDS, 2013). Sub-Saharan Africa remains disproportionately affected, and in 2011, 23.5 million PLHIV resided in this region. Southern Africa is the worst affected subregion in the world, accounting for 34% of all PLHIV in 2009 (UNAIDS, 2011a). Women of various global regions comprise half of all adults (15 years and older) living with HIV. This proportion has remained constant over the last 15 years (UNAIDS, 2013).

Across the globe, there is growing recognition that a comprehensive HIV prevention strategy is an optimal approach to combat the HIV/AIDS epidemic, as it integrates diverse biomedical, behavioral, and structural intervention components to prevent HIV transmission. Current strategies for HIV prevention incorporate the following: (1) biomedical interventions, such as treatment as prevention, preexposure prophylaxis (PrEP), and voluntary medical male circumcision (VMMC); (2) behavioral interventions that create demand, improve adherence to risk-reduction mechanisms, and provide psychosocial services to improve acceptance and utilization of essential HIV prevention and treatment services; and (3) structural interventions, such as policy-related changes, sterile syringe, and condom distribution.

This article highlights HIV risk prevention strategies that have been developed, implemented, and demonstrated efficacy in reducing the risk of HIV infection among adolescents, women, men who have sex with men (MSM), and heterosexually active men.

Adolescents and Youth

Impact and Epidemiology

An estimated 5.4 million adolescents and youth in the age-group of 15–24 years were living with HIV in 2012. Ninety-seven percent of new infections occurred in low- and middle-income countries (UNAIDS, 2011b). In 2011, sub-Saharan Africa accounted for approximately 85% (1.8 million) of all adolescents living with HIV (UNAIDS, 2011a). However, in a concentrated epidemic such as the one in the United States, adolescents are responsible for nearly half of all new HIV infections, despite representing only 25% of the total population (Guttmacher Institute, 2006a,b).

Between 2001 and 2011, new adolescent HIV infections decreased globally, although the difference was not statistically significant (UNAIDS, 2012a). The most notable reduction was seen in countries in sub-Saharan Africa and the Caribbean (UNAIDS, 2012c). The decline of new HIV infections among young people worldwide has been occurring simultaneously with behavioral changes such as waiting longer to become sexually active, having fewer partners, and an increased use of condoms with multiple partners (UNAIDS, 2012a). However, many adolescents still do not receive the support that they need to prevent transmission. For example, from 2001 to 2012, areas of the Middle East and North Africa experienced an estimated 50% increase in the number of new HIV infections among young people (UNAIDS, 2012c). Many young people in the age-group of 10–14 years are unaware of their HIV status. Additionally, there is a gender divide, as rates among young women in the age-group of 15–24 years are twice as high as those for young men, accounting for 22% of all new HIV infections and 31% of new infections in sub-Saharan Africa (UNAIDS, 2011b).

Selected Predictors of Risk

Adolescent HIV risk has been associated with a broad range of psychosocial predictors on multiple ecological levels, including individual, relationship, social, and structural. Many of the predictors in this constellation of risk are amenable to modification, an important consideration from a preventive perspective.

At the individual level, variability in perception of risk susceptibility impacts willingness to engage in sexual risk behavior. Similarly, evidence indicates that individual characteristics such as personality traits, psychological states (e.g., impulsivity, low self-esteem, psychological stress, depression), and self-efficacy (e.g., condom negotiation, condom use) play a role. Adolescents' HIV risk behavior also seems to be associated with other risk behaviors such as substance use, delinquency, and pregnancy.

Relationship characteristics also can have a significant influence on adolescents' risk behavior and subsequently their odds of contracting HIV. Although some commonalities in predictors of risk transcend gender, the role of social and intimate relationships creates important differences between male and female adolescents. Females are affected by issues such as partner's age, relationship control, fear of condom negotiation, and intimate partner violence – all factors that have been associated with increased HIV risk. For males, relationship factors more often provide protection against HIV transmission. For example, belief in contraception responsibility, partner's sexual inexperience, and early stages of the relationship have been protective against risky sexual behavior and associated with increased condom use.

On a social level, societal factors have an extensive impact on HIV risk, given their role in shaping cultural norms and influencing behavior. In a supportive social environment, young people can access HIV prevention, treatment, care, and support services. For example, faith-based organizations can play an important role in helping adolescents and youth access services. In Malaysia, the Department of Islamic Development partnered with the Ministry of Health to implement training programs to sensitize religious leaders on HIV-related issues and to reduce HIV-related stigma and discrimination within the communities (Malaysia AIDS Council, 2011). Similarly, among African-American youth, religion is one of the most ubiquitous influences. Involvement in and influence by religion has been shown to be significantly greater for African-American youth than their Caucasian and Latino counterparts. Understandably, religion, particularly religious persecution, has been shown to increase HIV risk among adolescent and young African-American MSM.

Structurally, gender inequalities, poverty, limited access to education, and gender-based discrimination have been shown to also significantly exacerbate risk of HIV infection among adolescent and young women. Widespread gender norms and violence contribute to heightened vulnerability in this population. For example, poverty and aspirations for a better life often motivate young women to engage in transactional sexual relationships, which increase risk of HIV acquisition. Regarding violence, findings of a South African study showed a relationship between intimate partner violence and HIV transmission among young women (Jewkes et al., 2010). Additionally, young women have lower comprehensive knowledge about HIV than young men. In sub-Saharan Africa, only 28% of young women demonstrated comprehensive knowledge compared with 36% for young men (UNAIDS, 2013). Eliminating new HIV infections among children requires ensuring that HIV prevention services reach this population and keep adolescent girls HIV-negative.

Intervention Efficacy

A new analysis featured in a 2013 UNICEF report shows that by increasing investment in high-impact interventions, two million adolescents, particularly girls, could avoid becoming infected by 2020 (UNAIDS, 2013). High-impact interventions include condoms, communications for behavior change (e.g., mass media), and targeted approaches for at-risk and marginalized populations. This prevention approach is also characterized by use of combined scientifically proven, cost-effective, and scalable interventions targeted to the right populations in the right geographic areas. This is in addition to investments in other sectors such as education, social protection and welfare, and strengthening health systems (UNICEF, 2013).

High-impact HIV prevention programs for adolescents have been implemented and evaluated in a multitude of settings, including community settings, schools, clinical sites, detention centers, and substance abuse treatment centers. Sufficient evidence indicates that regardless of the intervention venue, participation in an intervention yields some degree of positive risk reduction (Mullen and Ramirez, 2002; Ross et al., 2006). The most frequently reported outcomes are reduction of unprotected sexual intercourse or increased condom use and decreased frequency of sex. Other observed modifications include delay of sexual initiation, increased sexual knowledge, reduced sexually transmitted infection (STI) incidence, and fewer sexual partners. Although many interventions have effectively reduced sexual risk behaviors, these programs often result in only small to moderate effects and lack long-term sustainability.

Review of youth-based interventions in all countries reveals that tailored interventions for particular groups (e.g., African-American female adolescents, MSM, intrauterine device users) are generally more effective than broad-based interventions, whether implemented in high- or low-prevalence countries, or in generalized or concentrated epidemics. Recognition and responsiveness to the heterogeneity of adolescents allows prevention efforts to target specific behavioral risk characteristics, developmental levels, sexual preferences, and gender differences. Globally, strategic information on adolescents and youth within the HIV response, however, is lacking, particularly from key subpopulations. Therefore, global organizations such as UNICEF have called for a focused effort on collecting strategic information on adolescents who inject drugs or engage in transactional sex, young MSM, street-connected and institutionalized adolescents, and those from disadvantaged socioeconomic or ethnic backgrounds.

Implications for Practice: Improving Future HIV Prevention Efforts for Adolescents

Multiple efficacious HIV prevention interventions exist for adolescents. The 2013 UNAIDS report on HIV, adolescents, and youth calls for an expansion of successful approaches to HIV prevention for adolescents and youth. Preventing HIV in adolescents will depend not only on the development and evaluation of innovative intervention approaches but also on effectively translating and integrating efficacious programs into self-sustained components of clinic practice, school curricula, or community programs. Increasing evidence shows that it is possible to adopt or adapt existing HIV prevention interventions for adolescents in new contexts while also maintaining the core elements, theory, internal logic, and positive outcomes of the original program (McKleroy et al., 2006). However, implementing existing programs in a new community requires attention to cultural and contextual factors as well as specific HIV-related risks of the new target population. Failing to make these considerations may result in interventions that lack relevance, acceptability, and sustainability in the target population (Castro et al., 2004). Therefore, a critical step is implementing tailored interventions that target risk factors for specific groups of adolescents. This will help ensure effectiveness in reducing high-risk sexual behavior and STIs.

Investments should focus on interventions that can be efficiently scaled up and reach those most vulnerable. Such an effort would help extend, reinforce, and amplify intervention strategies and have a greater impact on HIV risk among adolescents.

Women

Impact and Epidemiology

When the HIV/AIDS epidemic was first recognized in the early 1980s, it was gender-structured to primarily involve networks of men. In the 1990s, HIV infection rates among women greatly increased and have remained stable, affecting a growing number of women. Women make up a greater proportion of new diagnoses than men; therefore, the number of HIV infections among this group is increasing in many countries. In 2012, women accounted for half of the 35.3 million global total cases of infection, primarily as a result of heterosexual transmission (UNAIDS, 2013).

HIV/AIDS is the leading cause of death for women in their reproductive years (15–49). Among young people in the age-group of 15–24 years, the HIV prevalence rate for young women is twice that of young men. Additionally, HIV-positive women are at increased risk for STIs, including *Trichomonas vaginalis*, *Chlamydia trachomatis*, and human papillomavirus; cervical dysplasia; and genital cancer. The high rate of HIV infection among women has dramatic consequences for both their own health and public health.

Selected Predictors of Risk

Much of the existing HIV prevention literature portrays women as especially vulnerable to HIV infection because of biological susceptibility. Male–female HIV transmission is twice as efficient as female–male, and multiple female-specific biological characteristics (e.g., sex during menstruation, oral contraceptives use) may enhance the efficiency of heterosexual transmission. HIV risk for women is also deeply intertwined with socially and culturally propelled imbalances of gender and power. For example, violence against women has been associated with HIV infection. Globally, 10–60% of women in the age-group of 15–49 years experience abuse (WHO, 2013). Previous research has indicated that fear of violence undermines the ability of women and girls to negotiate safer sex. It also has been well documented that abuse history is associated with HIV risk behavior such as lower rates of condom use, higher lifetime number of sex partners, earlier initiation of sexual activity, higher rates of drug and alcohol use, and a history of STIs. Moreover, abuse history has been associated with lack of responsiveness to STI and HIV risk-reduction interventions.

Intervention Efficacy

Both male and female condoms have been shown to be effective in preventing HIV transmission. In contrast to male condoms, which require men's willingness to use them, female condoms allow women to exercise power in their sexual decision-making without having to engage in condom negotiation with their male partners. Findings on the acceptability of the female condom, however, have been mixed and they are not used as widely due to several barriers. Therefore, behavioral interventions that focus on delaying sexual debut, decreasing the number of sexual partners and concurrent partners, and increasing safe sex behaviors, including condom use, are often components of several HIV prevention programs.

Reviews of HIV prevention programs in the United States for women have suggested that the most efficacious interventions (1) are guided by social psychological theories; (2) include only women; (3) emphasize gender-related influences, such as gender-based power imbalances, and sexual assertiveness; and (4) are led by peers. Multiple HIV behavioral interventions for women in the United States have been shown to be effective in reducing risky sexual behavior and increasing condom use. However, their impact on HIV transmission and incidence seems to be limited. Additionally, when examining developing countries, behavioral interventions have been shown to be less effective in reducing HIV transmission and risky sexual behavior among women.

Implications for Practice: Improving Future HIV Prevention Efforts for Women

Recent findings on HIV risk interventions for women emphasize the need to focus on both biological and behavioral interventions in order to reduce HIV transmission and incidence. Behavioral interventions are essential to help increase women's HIV knowledge, develop skills, and reduce risky sexual behavior. However, they also can enhance the

effectiveness of biomedical interventions by increasing condom use, HIV testing, and the uptake of other biomedical interventions.

Evidence also suggests that future research needs to more adequately address the contextual conditions impeding women's ability to protect themselves against HIV. Therefore, structural and policy-related interventions are also important. Globally, there is increasing recognition that gender should be addressed more systematically in all HIV/AIDS prevention programs, though progress is still slow. In 2012, 81% of countries reported that they included specific measures for women in national HIV strategies but only 41% allocated specific budget lines for such activities (UNAIDS, 2012b). It is important to realize that the most evolved set of HIV prevention intervention programs are structural interventions that address women's social risk for disease through myriad public health approaches from education, behavioral strategies, and biomedical interventions to policy. Ultimately, interventions for women that ignore the social, economic, cultural, and political realities of their environment will not be optimally effective.

Men Who Have Sex with Men

Impact and Epidemiology

MSM constitute the largest proportion of new infections in most of the developed world. Global prevalence rates, however, may be significantly underestimated, given only 87 countries currently report HIV prevalence among MSM. Data are most sparse for the Middle East and African regions, where criminal sanctions against same-sex sexual behavior can make epidemiological assessment challenging. Among MSM in Asia, the Caribbean, and Latin America, data on newly identified HIV epidemics are beginning to surface (UNAIDS, 2012a,c).

Surveillance data from low- and middle-income countries indicate that MSM are 13–19.3 times more likely to be HIV-infected than the general population. HIV prevalence among MSM ranges from 0 to 40%. Countries that have an HIV prevalence rate above 20% include Bolivia, Jamaica, Mexico, Thailand, Trinidad, and Zambia. In Pattern 1 countries (i.e., industrialized countries with large numbers of reported HIV/AIDS case such as North America, Western Europe, Australia), MSM continue to make up the largest proportion of new AIDS cases each year (UNAIDS, 2012c). In the United States, young MSM accounted for 72% of new infections among 13–24 year olds, and MSM in this age-group represented 30% of new infections among all MSM in 2010 (Centers for Disease Control and Prevention, 2012).

Selected Predictors of Risk

Currently, knowledge of HIV status is low among MSM. Patterns of sexual risk behavior may vary substantially depending on one's knowledge of his HIV status and that of his sexual partner. Evidence indicates that MSM aware both of their own and of their partner's HIV status are less likely to engage in discordant unprotected anal or oral intercourse. In several MSM subgroups, individual HIV testing behavior is impacted by social norms, low perceived risk of HIV infection, fear of a positive test result, and not knowing available testing locations. Additionally, for many MSM, stigma, discrimination, and laws criminalizing sex between men cause reluctance to disclose their sexual activities to health-care workers, thus limiting their access to voluntary HIV testing.

It has been suggested that the rise of the Internet as a facilitator of sexual networking has increasingly contributed to the reemergence of HIV among MSM (Centers for Disease Control and Prevention, 2003). However, evidence of the impact of advances in electronic communication on sexual risk behavior is inconsistent. Although HIV status disclosure is higher among men meeting partners online than those who meet partners in public locations, e-dating increases the ability to meet potential sexual partners, including those who prefer unprotected sex.

Intervention Efficacy

To date, HIV prevention approaches have been insufficient to mitigate the HIV epidemics in MSM. A number of behavioral interventions have been somewhat efficacious in reducing risk behavior among MSM but do not effectively decrease incidence of new HIV cases. Results of a systematic review concluded that studies with strong research designs (e.g., theory-based, measured biological outcomes, included control condition) indicated that individual-level, small group, and community-level behavioral interventions for MSM (e.g., individual counseling, peer education, group counseling, community building) reduced unprotected anal sex by 27% compared with minimal or no intervention. Effectiveness was greatest among interventions that included efforts to promote personal skills such as keeping condoms available and behavioral self-management, indicating merit of including such content in the development and delivery of new interventions for MSM. These interventions were most effective for majority white populations, illuminating the gap in outreach for some high-risk populations that have been critically underserved in intervention research, particularly MSM in countries where English is not the primary language (Jones et al., 2008).

Behavioral interventions are necessary to address HIV in MSM but are insufficient alone. New biomedical modalities such as daily oral PrEP and rectal microbicides have shown promise. For example, PrEP is a method in which individuals who are not HIV-positive take medication to reduce their risk of acquiring HIV. Robust data suggest PrEP's efficacy among MSM. A study by Grant and Lama (2010) demonstrated a 44% reduction in risk of HIV acquisition in this population. Recommendations from the Centers for Disease Control and Prevention indicate that PrEP should be offered to high-risk MSM "at substantial, ongoing, high risk for acquiring HIV infection" (Centers for Disease Control and Prevention, 2011). Little is known, however, about how to measure the duration of risk among MSM. Thus, it remains unclear how to identify MSM at ongoing high risk and how to determine the necessary duration of their PrEP use.

HIV testing programs for MSM are of special concern, given difficulty engaging these men in testing behavior that has been observed in many settings. Studies from Brazil, China,

Ukraine, and Uganda suggest that in some areas, offering community-based and mobile testing at convenient times and in culturally appropriate venues can increase voluntary testing rates. Additionally, 'test-and-treat' programs may be effective for MSM. Data show decreases in HIV incidence among individuals who know their status, as these individuals are less likely to engage in riskier sexual behavior. Early HIV identification through self and partner testing may enhance prevention efforts. Yet, questions remain on how to address the deleterious effect of social stigma on delaying individuals from accessing testing and treatment services.

Use of technology-enabled HIV prevention efforts has presented a unique opportunity to access MSM populations. Evidence indicates that scalability of HIV prevention programs can be enhanced, as online capacities offer the opportunity to increase fidelity of the delivery of program content with minimal incremental costs. Randomized control trials have demonstrated the feasibility of effectively enrolling, surveying, and administering online HIV prevention interventions to subpopulations that are often more difficult to reach through conventional means (e.g., rural) (Bowen et al., 2007; Preston and D'Augelli, 2004). Additionally, online research allows for enrollment of participants from broad geographic areas, increasing the extent to which research results may be generalizable. Modern computing platforms and survey utilities can also enhance measurement of complex behavioral patterns. For example, an Internet-administered questionnaire to collect information about sexual networks reported a more precise breakdown of the timing of sexual relationships compared with interviewer-administered methods (Rosenberg and Sullivan, 2010). Identified limitations of use of new communication technologies and online facilities include concerns with selection bias, ability to consent, and survey completion. Additionally, misclassification issues such as fraudulent data collection (e.g., survey submission by ineligible individuals) may arise where monetary incentives are offered.

Implications for Practice: Improving Future HIV Prevention Efforts for MSM

Reducing HIV incidence among MSM will require a diverse set of interventions, based on the understanding of patterns of spread and local norms. Coordinated behavioral and biomedical approaches could significantly decrease HIV incidence in MSM if delivered to scale. For example, efforts to increase HIV testing and treatment and also optimize PrEP uptake may be enhanced with technology-enabled strategies to achieve scale and strategic use of personally delivered package components. These prevention tools could substantially reduce new HIV infections in MSM; however, their effectiveness will continue to be undercut if structural considerations are not also properly addressed. Stigma, discrimination, and social-level homophobia continue to limit access and uptake of necessary services such as testing, condom availability, and PrEP. Expanding coverage and reaching these men requires structural changes and reform of policy that enable culturally tailored care. Safe and affirming spaces for prevention, treatment, and care must be a focus of future HIV prevention efforts for MSM.

Heterosexual-Active Men

Impact and Epidemiology

Heterosexual behavior constitutes a growing mode of HIV transmission in the United States and is a primary mode of transmission worldwide (UNAIDS, 2013). Although heterosexual men play a key role in HIV transmission to women, as a risk group, they have been and remain virtually invisible in most HIV/AIDS prevention theory, research, and interventions (Exner et al., 1999; Raj and Bowleg, 2012). In many countries, the focus of the epidemic has historically been on women and youth. For example, women are considered to be particularly vulnerable to HIV infection because of sociocultural and biological factors. Models of gender and the influence of male power and privilege also undergird important theoretical frameworks for understanding women's HIV risk. This has directed the focus to women in HIV public health prevention campaigns, leaving heterosexual men to receive considerably less attention in the epidemic.

Selected Predictors of Risk

Societies worldwide frequently position male sexual power as a prime driver of the HIV epidemic. In many contexts, the relational nature of dominant male norms exacerbates the risk of HIV transmission for women. This routine depiction of masculinity paints men as invulnerable and may play a role in preventing men from engaging in safer sexual behaviors and delaying them from seeking HIV preventative care and treatment. For example, masculinity is sometimes defined by having sex with multiple or concurrent partners. 'Traditional' male gender roles are also associated with less consistent condom use, less belief in male responsibility for contraception, negative attitudes toward condoms, abusive responses to condom negotiation, and intimate partner violence – a known correlate of transmission risk among women.

Intervention Efficacy

Behavioral interventions that focus on strategies to decrease risk behaviors among heterosexual men are typically created to support biomedical interventions. For example, there is compelling evidence that VMMC reduces the risk of heterosexually acquired HIV infection in men by approximately 60% (Bailey et al., 2007; Gray et al., 2007). By the end of 2011, VMMC had been performed on more than 1.3 million men in African countries, where this intervention approach is emphasized, nearly doubling the number completed from 2010 to 2011. Randomized controlled trials have shown that when performed by well-trained health professionals in properly equipped settings, male circumcision is safe. Additionally, a systematic review identified an estimated 20% reduction of HIV incidence among women whose male sexual partners had been circumcised (Weiss et al., 2009).

PrEP is an HIV prevention method in which HIV-negative individuals take a daily pill to reduce their risk of becoming infected. Findings from randomized trials have shown that PrEP is effective in protecting heterosexual men against HIV acquisition in diverse geographical settings. Challenges to PrEP have included the cost, potential drug toxicity,

and viral resistance. Additionally, there is evidence of behavioral disinhibition, leading to increased behavioral risk compensation (i.e., increased sexual risk-taking among individuals using known effective HIV prevention methods) among heterosexually active men. For example, a 2013 study discovered a significant increase in unprotected sex with outside partners among heterosexual male PrEP users (Mugwanya et al., 2013). PrEP, however, has been shown to reduce the risk of HIV infection among adult men and is particularly effective when combined and integrated with other HIV prevention methods.

Implications for Practice: Improving Future HIV Prevention Efforts for Heterosexual Men

WHO/UNAIDS recommendations emphasize that VMMC should be considered an efficacious intervention for HIV prevention in countries and regions with heterosexual epidemics, high HIV, and low male circumcision prevalence. Because VMMC provides only partial protection, it should only be one element of a comprehensive HIV prevention package that includes HIV testing and counseling services, promotion of safer sex practices, provision of condoms, and proper sexual health education to support skills and motivation to engage in these strategies. Including a prioritized focus on PrEP for high-risk heterosexually active men can also maximize prevention impact of an integrated approach.

Changing male cultural and socialization patterns will certainly not be an easy task but should be targeted. Focusing HIV prevention efforts on heterosexual male sexual behavior can make a difference in the epidemic among men and their female partners. Future programming that is invested in the intersections between masculinities, gender equality, and health can bolster a thriving culture of human rights and social justice.

Conclusion

Three decades after the first reported cases of AIDS, the HIV/AIDS pandemic continues to cast a tremendous burden. Considering the global scope of human suffering, negative social and economic impact, loss of productivity, and medical care costs related to HIV/AIDS morbidity and mortality, increasing the development, testing, availability, and implementation of efficacious risk-reduction interventions for various populations remains paramount. This article described global HIV risk prevention strategies that have been developed, deployed, and demonstrated efficacy in reducing HIV risk behaviors and infection rates among adolescents, women, MSM, and heterosexually active men.

Sufficient evidence suggests that the necessary tools to substantially alter the HIV epidemic regardless of mode of transmission are available. A growing number of countries are demonstrating increased control of the epidemic through effective prevention and treatment efforts. Additionally, meeting the scientific challenge of a functional cure is promising as the possibility of a vaccine draws closer. Much, however, remains to be done scientifically, programmatically, and socially. Key barriers to knowledge of HIV status and access to prevention, care, and treatment services continue to thrive in the forms of human rights violations, sexual orientation legislation, maltreatment of women and girls, marginalization of children, and stigma and discrimination. To address these issues, there is a continued need for budgetary support, political leadership, and commitment in partnership with affected communities.

In the absence of a highly effective vaccine or cure and with the current state of growing fiscal constraints and infrastructure and limited resources worldwide, maximizing prevention efforts will require utilization of evidence-based approaches for optimal combination of biomedical, behavioral, and structural interventions. When implemented in prevention efforts tailored to both HIV-negative people and PLHIV, combination prevention is a comprehensive strategy to ensure reduction in HIV incidence and strong control of the HIV/AIDS pandemic.

Abstract

Arlie Russell Hochschild is frequently cited as one of the most influential sociologists of the twentieth and twenty-first centuries. This is in part due to her contribution to the sociology of emotions, and she remains a central figure in this field of study. Within this general development lie concepts such as emotional labor and emotion work which have entered the lexicon of sociology and other disciplines and have extended her influence over a wide field. Her work moves thematically through the family, work, relationships, love and caring, and on each of these topics she has contributed unique insights. Underpinning this analysis is a desire to demonstrate the centrality of emotions in social life and how emotions explicate linkages between macro and micro domains. Hochschild's orientation is increasingly that of a public sociologist, and in this way her ideas are accessible to an audience beyond academia. This analysis of her work traces the origins and key elements of her theoretical ideas and considers her contribution to contemporary sociology and society.

Introduction

Arlie Russell Hochschild was born in Boston, Massachusetts, in 1940. Her keen observational powers were apparent from an early age as is evident from the many references to her personal life in her writing. At age 12 years she was transported into a very different cultural environment when her diplomat father was assigned to the American Embassy in Tel Aviv. The family subsequently lived in New Zealand where Hochschild began her college education and – she has noted – her experience of diverse cultures, and of being an outsider within these cultures, was instrumental in moving her toward her future discipline. The diplomatic world of symbolism and performance also provided material for her future study, and she has described being aware from a young age of the distinction between inner and outwardly expressed emotions. By the time she returned to the United States to enter Swarthmore College as an undergraduate, her cultural experiences were far wider than the average American student. The setting for her postgraduate study – the University of California in Berkeley – had a similarly transformative effect on her outlook. She entered Berkeley in the early 1960s and the campus soon became, as she describes herself, "the epicenter of national ferment" (Hochschild, 2013a: 2). The often violent campaign for social and political change, along with the feminist movement, influenced Hochschild's emerging ideas:

> With these movements swirling about me, I set about the quiet, steady work of gathering intellectual tools with which to clearly understand what was going on … and my search began to link the public trends astir at that time to the more private world of the family.
>
> 2013a: 2, 3

In this way Hochschild was attempting to decipher how the family, more generally intimate relationships, would emerge out of this era of change. The survival of family and relationships has been a major seam of interest in her work and is a topic to which she has returned throughout her career – most recently in 2013 with her collection of essays 'So How's the Family?'

Academic Career, Honors, and Awards

Arlie Hochschild graduated from Swathmore College with a degree in International Relations in 1962 and was awarded an MA (1965) and PhD (1969) in sociology from the University of California, Berkeley. She began her academic career in the University of California, Santa Cruz in 1969 and in 1971 she returned to the Department of Sociology in Berkeley as an Assistant Professor. She was appointed a Full Professor there in 1983 and has remained in Berkeley throughout her academic career except for a year spent teaching and researching in India as part of a Fulbright Scholarship and a semester as Lang Visiting Professor in Swarthmore College in 1992.

Hochschild has been the recipient of a Guggenheim Memorial Fellowship (1976–77), a Fulbright Scholarship (1997–98), the Andrew Mellon Foundation Emeritus Award (2007), and the Arensberg Award for lifetime achievement for Research on Work (2006); four awards from the American Sociological Association (ASA) – The Charles Cooley Award (1983) for her book The Managed Heart; The Jessie Bernard Award (2008) for The Second Shift, The Time Bind, and Global Women; the Award for Public Understanding of Sociology (2000), and a Lifetime Achievement Award (2001) from the Sociology of Emotions Section of the ASA. She has received research funding from the Ford Foundation (1990–91) and the Alfred P. Sloan Foundation (1997) – the latter to establish a Center for Working Families in the University of California, Berkeley. Hochschild has been conferred with honorary doctorates by Swarthmore College (1993), The University of Oslo (2000), Aalborg University (2004), The University of Lapland (2012), and Mount St Vincent University in Canada (2013). Her books appear in more than 15 languages, and her works have been the subject of a number of international conferences and seminars – most recently in 2012 when Zeppelin University in Germany hosted the

International Conference in Honour of Arlie Russell Hochschild.

Theoretical Influences

Arlie Hochschild began her sociological studies in a theoretical environment in which the study of emotions was primarily sited within the discipline of psychology. Within sociology emotional life was either ignored, subsumed within other theoretical categories, or left theoretically underdeveloped as in the work of Simmel and Mead. Durkheim, who studied an area (suicide) closely linked to emotions downplayed its personal, emotional, dimension. Parsons, working within the dominant theoretical perspective of the mid-twentieth century, namely structuralism and functionalism, did include emotions but as peripheral rather than as core to his theory of social action. Yet, within the Department of Sociology at Berkeley she found theoretical influences – notably those of Erving Goffman – which were more in harmony with her emerging ideas. Goffman had incorporated emotions into his work – notably in his dramaturgical perspective – but while acknowledging his influence Hochschild has argued that Goffman's conceptualization remains at surface, rather than at deep, level and are situation specific ("His characters had feelings … but we couldn't know, from Goffman, where these feelings came from"(2003: 7)). C. Wright Mills was another early influence, in particular his idea that the personality can be sold in the market, but Hochschild adds the proviso that people 'actively manage feelings' in this transaction (2012a: 229). She also drew on concepts developed by Marx, notably his ideas about alienation, as well as elements from Freud and Darwin, to develop 'A new social theory of emotion' (2012a: 228):

> Drawing on Dewey, Gerth and Mills, and Goffman within the interactional position, I explore what gets 'done to' emotions and how feelings are permeable to what gets done to them. From Darwin, in the organismic tradition, I posit a sense of what is there, impermeable, to be 'done to,' namely, a biologically given sense related to an orientation to action. Finally through Freud, I circle back from the organismic to the interactional tradition, tracing trough an analysis of the signal function of feeling how social factors influence what we expect to and thus what feelings 'signal.'
>
> Hochschild (2012a): 232

Hochschild's starting point is that human emotion and feeling are intrinsically social and that emotions are key to social life ("… it is through emotion that we know the world" (2013a: 4)) and to understanding links between micro and macro domains. As with Goffman, emotions are managed performances by individuals but Hochschild argues that these performances are conducted within cultural constraints and guided by rules (Feeling Rules) that vary according to social class, gender, etc. What people feel and express therefore depends on cultural norms and one's social category or position and these norms are absorbed from childhood within the family and elsewhere. The expression and management of emotion involves conscious effort and the way we do this 'emotion work' can be at the surface or deep level. When internal feelings are manipulated to produce a desired performance this involves emotional labor. If this process moves into the public sphere, and emotions and feelings are regulated by the workplace or market, then emotional labor becomes a commodity and this can have alienating consequences for the individual – a concept Hochschild based on Marx's theory.

Major Works and Publications

The basis of Hochschild's ideas were laid out in a 1979 American Journal of Sociology paper (Hochschild, 1979) but more specifically in The Managed Heart, published in 1983, and subsequent publications indicate the thematic development of her work. The next two books (The Second Shift (1989) and The Time Bind (1997)), focus on another major interest – family relationships and the gender division of labor in households. Her 2002 collection with Barbara Ehrenreich (Global Women) explores how modern family life is connecting to the market for its needs, and two more recent works (The Commercialization of Intimate Life (2003) and The Outsourced Self (2012b)) develop this outsourcing theme. In Hochschild's most recent book (So How's the Family and Other Essays), published in 2013, she spans and reviews her major thematic interests and emphasizes the linkages between them.

In the Managed Heart Hochschild develops the idea that institutions can manipulate emotions based on a study of airline flight attendants and bill collectors. Friendly, empathetic, service is an important selling point for the airline industry (as in most service industries), and this is ensured by selection of suitable personnel and training to fit the person to the job. In this way, Hochschild explains, feeling rules are no longer at the discretion of the worker and emotion work "… comes to belong more to the organisation and less to the self" (Hochschild, 2012a: 198). Some element of this is generally part of working in the service sector but the practice, she argues, becomes more insidious as organizations attempt to control emotions at a deeper level ("they suggest how to imagine and thus how to feel" (2012a: 49). This can result in emotional dissonance or alienation when strains develop between what the employee actually feels and what she/he is expected to present to the public. This aspect of Hochschild's theory has been criticized as overly deterministic, as creating "an illustration of emotionally crippled actors" (Bolton and Boyd, 2003: 289). Bolton and Boyd (2003) suggest that such interactions are two way, that workers have more control over their emotions than Hochschild implies, and that airline attendants can and do resist the demands of management. They argue that forms of emotional self-management vary considerably in the contemporary workplace, and this is supported by research findings indicating more nuanced feeling rules and emotions in present-day work settings (see King, 2012). Similarly, Wouters (1989) rejects the idea that having one's emotions commodified is inherently alienating. Yet, Brook (2009: 9) maintains that the commodification of emotions is acutely alienating and threatening to self-identity and that Hochschild's concept of emotional labor, although narrower in scope, is a valid interpretation of Marx's theory of alienation.

Hochschild has referred to families "as our most precious and emotionally powerful form of mutual commitment" (2013: 4) and the family has been a consistent seam in her work. Her concept of the family is broad; that is, constellations of people in close relationship to each other and the underlying theme is how people are managing love and care in contemporary society. In The Second Shift and The Time Bind she explores how the family is absorbing "… the revolution in the role of women" (Hochschild, 2003: 7) that has resulted from the large-scale entry of women into the labor market. In The Second Shift she describes how couples divide up their family and work responsibilities with women expected to undertake additional physical labor as well as a third 'shift' of emotional work in the home. Men do disproportionately less emotional work in families than women – the result, Hochschild suggests, of their higher status within these relationships. In The Time Bind she again examines the interaction between family and work life but this time she attempts to control for the work environment. The impetus for this study came from a finding in The Second Shift that the sharing of family roles was associated with marital happiness that led her to examine work and home balance in family-friendly companies. In these environments, however, where gender equality was facilitated, family/work tensions were still apparent, and there was evidence of some subjects seeking refuge from the family in the world of work. Although she presented these findings at that time as evidence of the negative impact of the market on family and personal life, it was clear that broader issues were also at play, which relate to the nature and status of caring. According to Hochschild caring work is viewed as low status and "doesn't necessarily bring joy" (2003: 5) – a view she admits holding herself from an early age – and this will remain an issue even if the market accommodates family and work lives. Hochschild has since remarked that combining family and work responsibilities relates to something deeper and is fundamentally about a balance of social and moral worlds (2013a: 276). These deeper themes are developed in her next group of books.

The Commercialization of Intimate Life and The Outsourced Self (and Global Women which she coedited with Barbara Ehrenreich) continue to explore how people are 'doing' love and care in a society in which the majority of parents work outside the home, and marriage and informal systems of care are becoming increasingly precarious. The Commercialization of Intimate Life describes the impact of this confluence of factors on families including the children who are positioned as eavesdroppers in this ongoing saga. However, as Robert Bellah notes on the cover of this book, this is not a celebration of the traditional family but rather an exposure of its shortcomings and inability to cope with the crisis in love and care. Hochschild implicates "the stalled revolution for gender equality" (Hochschild, 2003: 170) in this impasse. Her view is that caring and nurturance have been demoted and marginalized, contrary to the original tenets of feminism, which sought to engage both parents equally in childrearing. Present-day families, unable, and sometimes unwilling, to cope with the demands of both work and care roles, are outsourcing the latter. As society increasingly consumes rather than produces care, she argues, this outsourcing of care has become inevitable.

In The Outsourced Self Hochschild follows the consequences of the commodification of carework and growing pressure from the market to commercialize the self (2012a: 14). Experts are now retained for activities once regarded as ordinary and instinctive and the intimate realm is increasingly influenced by the market. It is a far cry, she suggests, from the 'just do' spirit of spontaneous community cooperation of former times (2012a: 14). Another theme here is the gendered nature of carework in that women are disproportionately employed in areas which require care and emotional labor and how emotional labor is now crossing borders and has a transglobal dimension. Intense emotional labor is required when women cross continents to care for children leaving their own children in the care of others. In the Outsourced Self she describes an extreme expression of the encroachment of the market into intimate life referencing surrogacy clinics in India. In these clinics surrogates produce babies for couples in more affluent regions and Hochschild refers to these centers as a point "on an ever-widening two-lane global highway" that connects poor to rich nations (Hochschild, 2011: 262). Those who run the clinics view surrogacy as a straightforward, mutually beneficial, commercial transaction and appear to be immune to the emotional labor involved as the women suppress feelings in order to detach from the babies. Hochschild notes that "this ideal of the de-personalized pregnancy is eerily reminiscent" of Huxley's novel Brave New World (2011: 265).

These examples of twenty-first century emotional labor connect to Hochschild's theory of emotions and her analysis of caring work, and it also links to broader conceptual themes concerning the colonization of the lifeworld as developed by Habermas (1987). But while Habermas confined this incursion mainly to the public sphere, Hochschild, as Musial (2013: 44) suggests, has demonstrated the extent of its invasiveness into people's intimate lives. In her most recent publications, Hochschild revisits this issue, pointing to the dangers of a market culture that is profoundly changing the nature of emotional attachment, where we feature as consumers rather than creators of love, and asks "What, if anything, is too emotional to sell?" (Hochschild, 2011: 263).

Impact of Hochschild's Contribution

Arlie Hochschild's contribution is multifaceted but within academia her primary influence lies in her theoretical and empirical development of emotional life and more specifically in marking out the Sociology of Emotions as a field of study. In doing so she shifted attention to the social dimensions of emotions demonstrating, in contrast to biological approaches, that emotions are fundamentally social and that social factors infiltrate the entire process and context. Her viewpoint is determinedly sociological although amenable to cross-disciplinary approaches, and while this work is more generally sited within microsociology it has strong links to macro concerns via her studies of institutions. Emotion, as she has said, 'is the heart of what sociology is' (D'Oliveira-Martins, 2014) and provides an explanatory bridge between the self and society which makes this study area central to sociological inquiry. Hochschild's approach can be traced from Simmel and Goffman but, as the introduction to her theoretical development above implies, Hochschild did not merely build on the

nascent ideas of Goffman and others but reached deeper and broader in producing a theoretical framework that made emotional life theoretically and empirically visible. She was not the first sociologist to identify emotions as important but it was Hochschild who delineated this area providing a paradigmatic framework and workable concepts – an achievement Goffman doubted was possible (see D'Oliveira-Martins, 2014). In doing so she initiated a seam of analysis within sociology which has increased in importance over the past three decades, and the influence of her theoretical ideas span many disciplines and arenas. As Bolton and Boyd (2003) note, little has been written in the area of emotion over the past 30 years which does not cite The Managed Heart.

Her most widely disseminated contribution has been her linking of emotions and work, describing how workers carry out emotional labor that can be incorporated by the capitalist labor process. The concept of emotional labor has been mentioned in over half a million publications and cited in 10 000 academic papers and the number of citations has grown exponentially since 2000 (Hochschild, 2013b). The number and variety of these empirical studies attest to the validity and efficacy of these concepts and to the vibrancy of the subject area – as the editors of a recent collection of papers on this theme suggest (Grandey et al., 2013). Anat Rafaeli's (2013) analysis of emotional labor as a social meme of particular societies is an example of the theoretical outreach of this work and implies an analytical program which is simultaneously moving deep and wide. There have been calls for more attention to be paid to core issues (see Garey and Hansen, 2012; Wharton, 2013), but it is clear that these concepts have proven sociological and cross-disciplinary appeal. Moreover, the concept of emotional labor has been adopted by organizations and incorporated into the intellectual arsenal of business gurus. As Hochschild notes, "… capitalism has found a use for emotion management, and so it has organised it more efficiently and pushed it further" (2012a: 186).

Hochschild's theoretical influence is, however, broader than just the analysis of work and labor. At a basic level her framework allows us to understand emotions in social life and she provides diverse empirical evidence to demonstrate the importance of emotions and emotion patterns in society. Wharton, a frequent commentator on her work, has remarked that the main concerns of "Hochschildian sociology" – relationships and families and the encroachment by the market into these intimate realms – signify the importance of her work (Wharton, 2011: 463/464). Ways of belonging and relationships have transformed in contemporary society but the need for attachment and meaning remain key to social and psychic survival. Her ideas, developed in The Second Shift and The Time Bind and now extended to families in the global economy, provide a basis from which to tease out the complexities of present-day emotional attachments and the caring responsibilities that go with them.

Some of Hochschild's views on the family may need re-evaluation to take account of contemporary relationship trends. Similarly, structural issues, especially class, may have a greater impact on emotional expression than her work implies (Simon and Nath, 2004). According to Hochschild, emotional scripts and agendas for men and women differ with women taking on more emotionally expressive duties and men more likely to stay affectively neutral. This scenario does not take sufficient account of changes in family dynamics and gendered emotion work which is emerging from current empirical work. Women are increasingly taking on traditionally male attributes and becoming more economically independent while some men's lives have been transformed by adverse economic conditions (Lively, 2013: 242). Noelle Chesley's (2011) work illustrates how job instability among lower socioeconomic male groupings is driving more equitable family arrangements as men are pushed into more active parenting and household roles. Similarly, analysis of male emotions within the sphere of masculinities theory is deconstructing binary notions of emotional lives and traditional concepts of male emotions. The pressure on some groups of men to suppress their feelings and produce culturally acceptable emotional performances is emerging as a consistent trend and high male suicide rates may be a manifestation of this, representing the externalized cost to society of this repression of emotions (Cleary, 2012). Alongside this is a broader movement assessing work–life balance that is reevaluating conventional, including gendered, ideas of living and working and in which traditional female emotion skills have a high currency (Lively, 2013: 242).

These themes relate to Hochschild's discussion of dominant emotional narratives such as the extolling of the rational, emotion-free voice in western thought and the implications of this for social and political life. Yet, according to Hochschild, we are beginning to value authentic, spontaneous, feeling to prize the 'unmanaged heart,' a trend, she suggests, is "emerging in response to the rise of corporate guile" (2012a: 190/192). At the same time, as intimate life moves into the market language and feeling rules are changing as we become separated from the acts by which we used to say we care. Here Hochschild is connecting to a body of work mapping emotional discourses over time (see, e.g., Elias, 2000; Wouters, 2007). These ideas also reflect those of Giddens (although she rejects a close connection – see Wilson and Lande, 2005) as well as Bourdieu's notion of emotional capital. In a shifting, fragmented world where people struggle with issues of self-identity, her focus on emotion work helps to illuminate the activities of individuals attempting to create meaning. As Hochschild has remarked this puts the study of emotions at the very heart of twenty-first century sociology in tracing links between private troubles and public issues (2013a: 7).

Hochschild's role as a public sociologist is an increasingly important dimension of her activities although this facet has always been present in her work, and she speaks of "a powerful split between two parts of myself – one geared to 'doing' and the other to 'figuring things out'" (2013a: 1). Her narratives of public concern move through the contradictions that continue to exist in work and home, the impact of the care void on children and older people, the extent to which caring work is being outsourced to the market, the downsizing of public services, the growing gap between rich and poor, and the challenges of globalization. The realities of the global care industry are vividly described in her profiles of mothers doing the emotional labor of detaching themselves from their own children to care for others in more affluent parts of the world. Her public role and the communication of her ideas to an audience beyond academia is facilitated by the accessibility of

her published work. Hochschild is the recipient of three New York Times Notable Books of the Year, and Judith Shulevitz described The Outsourced Self as in the genre of popular or public sociology and Hochschild as "eliciting thoughtful reflections from ordinary people" (New York Times/Shulevitz, 2012). Her ability to convey her ideas in sparse and easily understood ways was also the basis of an ASA citation which referred to her "creative genius for framing questions and lines of insight often condensed into paradigm shifting words and phrases" (American Sociological Association, 2013). Another, related, feature is her ability to insert her own life into her work which resonates with feminist thinking. Although some colleagues cautioned against linking personal and intellectual stories, Hochschild believes this subjectivity is key to her observation. Very few theorists place themselves to such an extent within the story and while, at times, this may appear sentimental, even atavistic, in tone (as in her description of summers spent in rural Maine) it hits a more political, and realistic, target in her account of working and parenting as a young academic in the 1970s (Hochschild, 2003). The fact that Hochschild journeyed through an inequitable gender system is clear from her narrative (see Hochschild, 2003: 227–254, Inside the clockwork of male careers). Her struggles were/are not the same as the majority of women grappling with the complexities of combining employment and motherhood but her narratives reach over this divide due to her willingness to go out there and engage with people using her very considerable ability to empathize with her respondents. These personal inserts, along with her engagement with those she writes about, bring a particular explicitness as well as integrity to her work. She has shown herself to be an honest appraiser of feminism and its appropriation by capitalism which "incorporated the idea of equal pay for equal work and diversity but dispensed with any challenge to the priorities of the system women wanted in on" (2003: 254). These themes signal another significant achievement – becoming a senior academic in a sparse female terrain and going further to enter an even rarer sphere – the annals of encyclopedic collections as a major sociological theorist.

Barbara Ehrenreich (2011) has referred to Hochschild as an iconic thinker but she has, as demonstrated above, underpinned the originality of her thinking with a strong theoretical base and workable concepts. She has produced a body of work, including a subdiscipline, which is firmly established within sociology and widely known across other disciplines and beyond academia. This work engages with many of the key issues of our times – primarily how we love and care for each other and is underpinned by data that she continues to collect and mine herself. As a public intellectual she has delivered her message from both small and illustrious platforms using the discipline of sociology as the channel and in this way "she exemplifies the ideals of engaged and informed sociology" (American Sociological Association, 2013). The communication of this message is also aided by another factor that Wharton (2011) has referred to – her personal interest in the work of those who seek to follow in her footsteps. Few academics of her level give such time to mentor interested scholars, doing emotion work herself as she weaves issues from across the world into the emotions paradigm. She once told an interviewer that she likes to take her readers on an intellectual journey, guiding them to explore the important issues of our time (see Wilson and Lande, 2005). Assessing four decades of her very considerable body of work one can conclude that Arlie Russell Hochschild has accomplished this.

Abstract

This article considers the systematic extermination of the Jews of Europe by the Nazis during World War II. It will also allude to the historical background of the extermination and to related contemporary circumstances. A first section of the article deals with some aspects of the historical context, a second one will briefly present the immediate setting of the 'Final Solution to the Jewish Question,' while the third and central part will address the extermination *per se* and the reactions to it.

'The Holocaust' is the term most widely used in reference to the systematic extermination of the Jews of Europe by the Nazis during World War II. Usually, the term also alludes to the historical background of the extermination and to related contemporary circumstances. The first section of this entry will deal with some aspects of the historical background, the second will briefly present the immediate context of the 'Final Solution to the Jewish Question,' while the third and central part will address the extermination per se and the reactions to it. This chronological presentation does not imply an unavoidable passage from one phase to the next. However, while the link between the evolution of German history during the first two decades of the twentieth century and the onset of the Nazi regime was in no way evident, the causal relation between the anti-Jewish policies of the early war period and the extermination was much closer.

The Background

The historical origins of the Holocaust remain an object of ongoing debate. Whereas some scholars consider the extermination of the Jews as the consequence of a specific evolution of German history, at least from the end of the nineteenth century onwards, others interpret the Holocaust as an outgrowth of modernity, the implementation of a pitiless instrumental rationality at the service of a totalitarian racial utopia. Both approaches are not incompatible.

The rise of racial anti-Semitism, the spreading of social Darwinism, and the publication of the first theories of racial anthropology and eugenics turned the late nineteenth century into a breeding ground of ideological trends that were to become central tenets of the Nazi worldview. And, although political anti-Semitism declined in the Wilhelminian Reich at the beginning of the 1900s, an increasingly vocal anti-Jewish hostility spread throughout wide sectors of German society. In this evolution, the outbreak of World War I became a major turning point.

After a brief period of national unity, the unforeseen prolongation of the conflict and the growing political polarization which it induced triggered a radicalization of anti-Jewish attitudes, mainly in the nationalist-conservative camp. The defeat of Germany, the revolutionary upheavals that followed, and the birth of a republic hated and rejected by an important sector of the population, as well as the vast majority of the traditional elites, fanned the already virulent anti-Semitism even further. The Jews were accused of bearing the responsibility for the national humiliation (the 'stab in the back' myth), of controlling the new republic, of instigating bolshevism and, above all, of conspiring to dominate the world, as described in the most widely read anti-Semitic forgery of the century, *The Protocols of the Elders of Zion* (1919).

It was in this postwar atmosphere that Adolf Hitler began his political career by joining the tiny German Workers' Party (DAP) in Munich, in late 1919. In 1920, the DAP became the National Socialist German Workers' Party (NSDAP) with anti-Semitism figuring prominently in its 25 point program. Notwithstanding the failed putsch of 1923 and Hitler's brief incarceration, the resumption of his political agitation in 1925 along with systematic organization, unrelenting propaganda, and, more than anything else, the impact of the Great Depression propelled the party into prominence on the national scene.

Anti-Semitism lay at the center of Hitler's worldview from the outset of his political career and remained so after his accession to power on 30 January 1933. Reduced to its core, this anti-Semitism viewed historical evolution as determined by a merciless racial struggle dominated by the confrontation between Aryan and Jew. The outcome of this struggle was to decide the fate of mankind and particularly of the Aryan race. Hitler's faith had an apocalyptic dimension, presented in terms of 'scientific' theories. But how far this worldview concretely led to the systematic planning of the anti-Semitic policies of the regime, or, obversely, to what extent these measures were the result of uncoordinated initiatives stemming from a growing radicalization of the party and its agencies, remains an open question. One could argue that the ideological guidelines indicated a general framework for action, but that the 'twisted road' followed by the implementation of the anti-Jewish policies was dictated by changing circumstances. In any case, during the 1930s, no plan for a physical extermination of the Jews existed; the ever-more extreme anti-Jewish policies of the prewar years had two successive and identifiable aims: the exclusion of the Jews from the national racial community (the *Volksgemeinschaft*) and, thereafter, their expulsion from the Reich.

From the outset of the new regime the Jews were dismissed from the civil service, from a growing number of professions, and from all major fields of German cultural life. Moreover, all that belonged to or had been influenced by the 'Jewish spirit' had to be cleansed from the German cultural sphere: Freud's or

Einstein's theories, Heine's poetry, Mendelssohn's music, books, works of art, memorial plaques, films, libretti – anything. A stream of anti-Jewish incitement was daily spewed out by all the propaganda channels of party and state, under the guidance of Propaganda Minister Joseph Goebbels and chief party ideologist, Alfred Rosenberg; it found its most rabid expression in *Der Stürmer*, the 'specialized' anti-Jewish organ of the Gauleiter of Franconia, Julius Streicher. The entire education system soon absorbed the anti-Semitic message, as did the Hitler Youth (HJ) and the League of German Girls (BdM). The indoctrinated youngsters of the 1930s were to become the soldiers of the 1940s.

In September 1935, the Nuremberg Laws added strict biological separation to social and cultural segregation by forbidding marriage and sexual relations between Jews and Germans (the Law for the Protection of German Blood and Honor). The Reich Citizenship Law reduced the Jews to second-class citizens. Finally, the first 'Supplementary Decree' to the Reich Citizenship Law defined who was a Jew or, alternatively, a 'mixed breed' of the first or second degree (November 1935). Any transgression of the 'Blood Law' was considered as 'race defilement' (*Rassenschande*), and the offenders (usually the Jewish male offenders) were sent to jail or a concentration camp.

In 1936, the *Reichsführer SS*, Heinrich Himmler, was put in command of all German police forces. This reorganization of the control and terror apparatus led to the appointment of SS General Reinhard Heydrich, previously chief of the security service of the SS (*Sicherheitsdienst* or SD) to the command of both the SD and the newly established Security Police (*Sicherheitspolizei*), which included the Gestapo and the Criminal Police. After the outbreak of the war, these agencies were further centralized within the Reich Security Main Office (*Reichssicherheitshauptamt* or RSHA). While the planning of direct anti-Jewish terror was mainly Himmler's and Heydrich's preserve, the plundering of Jewish assets and enterprises was orchestrated by Hermann Goering's Four Year Plan Administration, and, after the dismissal of the conservative minister of the economy, Hjalmar Schacht (who had managed to protect some measure of Jewish economic life), by his Nazi successor, Walther Funk.

After the annexation of Austria, in March 1938, the drive to compel the Jews to leave the 'Greater German Reich' ('Old Reich' and Austria) became overwhelming. During that year, 'compulsory Aryanization' and, ultimately, the prohibition of any Jewish economic activity destroyed the material basis of Jewish existence in Germany. Notwithstanding the widespread reticence of most countries to take in Jewish refugees (easily identifiable since, at the demand of the Swiss government, their passports were marked with a 'J'), forced emigration and even expulsion over the borders became standard Nazi practice. Finally, on 9 and 10 November, following the killing of a German diplomat by a Jewish youth in Paris, a nationwide eruption of state-organized violence, the so-called 'Night of the Broken Glass,' destroyed the remnants of Jewish life in Germany. The Jews of the Reich now desperately attempted to flee. The panic soon extended to the Jews of the 'Protectorate of Bohemia and Moravia,' after the German occupation of Prague in March 1939. Yet, it was the German attack on Poland, on 1 September 1939 and the outbreak of World War II that entirely changed the fate of European Jewry.

The Immediate Context of the 'Final Solution' (1939–41)

During the first 2 years of the war, the goal of Nazi anti-Jewish policies still appeared uncertain. Jewish emigration from the Reich and occupied Europe remained a possibility, although wartime conditions soon reduced it to a trickle. The goal frequently alluded to was a territorial concentration of Europe's Jews, first in the easternmost part of Poland, in the Lublin area of the newly established 'General Government' (the name used for the nonannexed area of Poland which was put under the authority of the Nazi 'Governor General,' Hans Frank), then, after the victory over France, in the French island colony of Madagascar, and, finally, after the attack on the USSR, in Arctic Russia or Siberia. None of these plans ever materialized, except for some short-lived attempts to deport Jews from Vienna and the Protectorate to the Lublin area, in the fall of 1939 and in early 1941.

A few months after the occupation of Poland, the Nazis started to deport hundreds of thousands of Jews and Poles from territories annexed to the Reich, such as the Warthegau (a part of western Poland), into the General Government; they drove the Jews into ghettos in larger towns and even dumped Jews from the Reich into Vichy France, in the fall of 1940. The deportations within ex-Poland may have been linked in part to the regime's policy of ingathering ethnic Germans from the Baltic countries, the Russian occupied territory of Poland, and the Balkans in the 'Great Germanic Reich.' Thus, the deportations of Jews and of Poles from the Warthegau were meant to make space for the incoming *Volksdeutsche*. The policy was pursued under the orders of Himmler, as newly appointed 'Reich Commissar for the Strengthening of Germandom' (RKF). It was meant to be the first stage of what became known as 'General Plan East' (*General Plan Ost*), aimed at establishing German domination in the East for centuries to come. The enslavement of entire nations and the death of tens of millions of local inhabitants was taken into account. This policy was probably not directly linked to the genesis of the 'Final Solution' since it cannot explain the deportations from the west (to be described later on).

Simultaneously, from October 1939, an entirely separate but not unrelated operation had started in the Reich: the systematic mass murder of the mentally ill, the so-called euthanasia or 'Aktion T-4': personnel were trained and killing methods were developed that were to be used for the mass extermination of Jews after the scaling down of T-4, in the summer of 1941, to a less visible 'euthanasia' operation (Aktion 14f13).

In Western Europe, the much smaller Jewish populations were not secluded (except for the establishment of a semi-ghetto in Amsterdam) or as brutally treated as the Jews of Poland. But their exclusion from public service and the liberal professions, growing curtailment of their economic activity, the registration of persons and property, limitations on travel, and police surveillance turned them into pariahs. Their persecutors were not only the Germans, but also satellite regimes such as Vichy France.

After the German occupation of Yugoslavia and Greece in April 1941, Serbia remained under direct military control and Croatia became a satellite; in both countries, harsh anti-Jewish measures were introduced. Slovakia's anti-Jewish policy

followed strict German orders. Romania implemented fierce anti-Semitic measures of its own, and only Hungary and Bulgaria maintained semi-independent policies in this domain.

In order to facilitate their control over the Jews – beyond territorial concentration – as well as to degrade them, the Nazis compelled all those over the age of 6 to display a 'Jewish star' on their clothing, first in Poland, then, from September 1941 on, in the Reich and the Protectorate, and, in the spring of 1942, in all countries of occupied Western Europe. But the principal instrument of Nazi domination was the 'Jewish Councils.' These councils, composed of representatives of the Jewish communities, received German orders, conveyed them to the Jewish populations, and were responsible, upon pain of death, for their implementation. Moreover, in Eastern Europe the Jewish Councils became agencies of a Jewish self-administration of sorts, struggling against impossible odds; justly or unjustly, they often became targets of sarcasm, resentment, and even hatred in their own communities. Some historians have adopted a highly critical stance toward the councils, considering them as instruments in the hands of the Nazis for the destruction of their own people. Others have questioned this overall characterization as the differences in the behavior of the councils were considerable. All in all, the councils' members were ordinary people confronted with entirely unprecedented circumstances: their own reasoning was incompatible with the murderous strategy of the Nazis.

The Extermination

Systematic mass extermination of Jewish populations began with the German attack on the USSR, on 22 June 1941. Whereas in most newly occupied Soviet territory mainly Jewish men were executed until August 1941, in the Baltic countries and in Transnistria (where the Romanian army was the principal ally of Germany), entire Jewish communities were butchered from the outset. The killing of Jews in party or state positions had been ordered by Heydrich on the eve of the campaign; the perpetration of pogroms by local inhabitants was also explicitly fostered by the Germans. Whether the killing that engulfed the entire Jewish population from August 1941 onwards was independent of any instrumental goals, or whether, as with the starving to death of two million Russian POWs before the spring of 1942 (around 3.3 million died before the end of the war), it derived from difficulties experienced by the Wehrmacht in securing sufficient food supplies for the army is not clear. In any case, the mass murder of Jews on Soviet territory (around 500 000 victims by the end of 1941) was not perpetrated solely by the 'intervention units' of the Security Police and the SD (*Einsatzgruppen*), by local auxiliaries, and by the Romanian army in the south, but also by tens of Reserve Police Battalions and regular Wehrmacht units. In other words, not only the 'troops of the ideological war' (the SS) but ordinary men, possibly ten of thousands of them, were involved, often willingly so, in the mass murder of the Jews.

Few historians would now argue that the decision to exterminate all the Jews of Europe predated the attack on the USSR. Some contend that this decision was taken by Hitler soon after the German onslaught, during the period of 'euphoria,' due to the apparent success of the invasion, and that it found its expression in Goering's letter to Heydrich of 31 July 1941, ordering him 'to take all necessary measures to prepare the Final Solution of the Jewish Question in Europe.' Others argue that such an order was issued in the early fall, when doubts may have risen in Hitler's mind about the prospects of a quick victory in the East. Others still link the order to the USA's entry into the war, in other words to the transformation of the European war into the 'world war,' which, as Hitler had 'prophesied' in his Reichstag speech of 30 January 1939, would see 'the extermination of the Jewish race in Europe.' This last interpretation seems bolstered by documentary evidence. On 18 December, according to Himmler's appointments diary, the SS chief met with Hitler and wrote down: 'Jewish question/ eradicate as partisans.' The reference to 'partisans' is clearly a way of describing an enemy lurking behind the lines, an internal foe, who, just as in 1917/18, would stab Germany in the back if given the chance. Finally, some historians doubt the existence of any clear order given at the highest level and consider total extermination as resulting from the cumulative effects of local initiatives.

By October 1941, the killings had extended to Jews from the Greater Reich and the Protectorate who were deported mainly to Lodz, Riga, Kovno, and Minsk. In Riga and Kovno, thousands were shot on arrival. The others were exterminated later with the inhabitants of their ghettos. They had also spread to Serbia, where the Wehrmacht executed some 6000 Jews in reprisal for partisan attacks. During the same month, Jews were forbidden to leave the continent, 'in view of the coming final solution of the Jewish Question' and the construction of the Belzec extermination camp (possibly that of Sobibor too) began in the General Government.

In early December, the first extermination site became operational at Chelmno, near Lodz, principally for the murder of Jews from the Warthegau. On 20 January 1942, in a meeting in Berlin (*am Grossen Wannsee*), Heydrich informed an array of state secretaries, senior SS officers, and other selected officials of the general extermination program that, according to his computations, was to apply to 11 million European Jews. From then on total extermination became a problem of logistics and of some measure of haggling between the Germans and various governments or local authorities about handing over their Jews. In almost all cases, foreign Jews were arrested and delivered first, local Jews followed (as will be indicated further on, in some rare cases Jews were not handed over at all).

The arrests of Jews, mainly in Western Europe, and the logistics of the deportations were coordinated between the Higher SS and Police Leaders (HSSPF), Himmler's delegates to each occupied country or major area, local authorities and police forces, and the Jewish Affairs section at the RSHA (IVB4) under Adolf Eichmann. Furthermore, the deportations demanded joint planning with the Reich Railways Authority (*Reichsbahn*) and its territorial subdivisions (*Ostbahn*, etc.). Once the Jews reached the camps, they passed under the command of the SS Economic and Administrative Main Office (*SS Wirtschafts- und Verwaltungshauptamt*) under SS General Oswald Pohl (except for the *Aktion Reinhard* camps). In the camps, the Jews were destined for extermination; however, mainly in Auschwitz, selections separated the healthiest and the strongest from the mass of the inmates, submitting them to slave labor before sending them to their death.

The first stage of the extermination chiefly included the Jews of the Warthegau and of the General Government who, through 1942, were killed in the *Aktion Reinhard* camps (Belzec, Sobibor, Treblinka, and Majdanek), as well as in Chelmno. The deportation of the Jews of Warsaw to Treblinka began in July 1942. Simultaneously, deportations from Western Europe (France, Belgium, and Holland) started. By then, the principal Auschwitz extermination camp (Auschwitz II or Birkenau) had become fully operational. The killing method shifted increasingly from the use of carbon monoxide gas to that of Zyklon B, a powerful pesticide utilized in the fumigation of army barracks and ships' holds. Before they were killed, the victims' valuables and clothes were taken away and their hair was shorn; after the gasings, gold teeth, and artificial limbs were removed from the corpses. The German economy recycled the 'booty': gold was smelted and delivered to the *Reichsbank;* hair was used for mattresses, slippers, etc.; clothes were distributed by the *Winterhilfe* (the German winter-relief organization). Homes, furniture, and other belongings left behind by the deportees were distributed to deserving *Volksgenossen* or acquired, usually at dirt-cheap prices. This allocation of spoils spread to occupied countries in the West. Particularly valuable objects, mainly art, looted all over Europe by the *Einsatzstab Reichsleiter Rosenberg* or ERR, were offered to Nazi leaders (Hitler and Goering headed the list), to German museums, and various other German institutions.

In 1943, the last batch of German Jews was deported to the extermination camps; the deportations from Western Europe continued, and, simultaneously, the Jews of the Balkans and, by the end of the year, of Italy (following the German occupation of the greater part of the peninsula) were included in the killing process. From March 1944 onward, after the occupation of Hungary by German troops, this country's Jews became the last large national group of victims (over 400 000) to be sent to Auschwitz-Birkenau. On 2 November 1944, Himmler ordered the cessation of the mass exterminations; his order was frequently disregarded, even after the liberation of a growing number of camps by the Allies. 'Death marches,' organized by camp commanders or SS personnel, went on throughout the winter of 1944–45 and practically until the German surrender in May 1945. By the time the war in Europe drew to a close, approximately 5.5 million Jews had been exterminated.

The exterminations on Soviet territory had become widely known by the fall of 1941. Information about the mass killing of European Jewry beyond the Soviet border spread throughout the continent, and in Allied and neutral countries from the second half of 1942 onward, although the technical details of the 'Final Solution' may not have been widely known until 1944. The overall reaction was one of indifference and inaction, sometimes of outright collaboration. While Vichy authorities and police collaborated with the Germans in the arrests and deportations, Switzerland hermetically closed its borders to the Jews who attempted to flee. In general terms, the Christian churches intervened feebly, mainly on behalf of converted Jews. Thousands of Jewish children were hidden in Christian institutions; in most cases, their lot was conversion. The silence of Pope Pius XII, notwithstanding some help from the Vatican in hiding Jews in the fall of 1943, has, to this day, remained a matter of heated debate.

In some cases, the reactions were different. Spain and Portugal allowed the transit of Jews through their territory. Sweden attempted to take in the Jews of Norway when the deportations started and it took in almost all the Jews of Denmark (most of whom were transported to safety by the Danes themselves). Protests against the anti-Jewish measures were staged in Holland, in early 1941; the Italians tried to protect the Jews in their own country as well as those under their control. Bulgaria refused to deliver its own Jewish citizens, although it did deliver the foreign Jews. Finland rejected all German demands regarding its small Jewish population.

'The abandonment of the Jews' by the Western Allies is largely undisputed nowadays. Rejected or fatally delayed rescue plans involved transfers of ransom money to the Germans or their allies, or the bombing, in 1944, of the Auschwitz gas chambers and of the railway line connecting the camp with Hungary. Such refusal to help, whether known or merely sensed, could but contribute to the feeling of total isolation of the Jews of Europe in the face of the German extermination process.

The concrete possibilities of Jewish resistance were almost nil. Moreover, by the time most European resistance movements became active, the bulk of European Jewry had been exterminated. Hence Jewish armed revolt in the ghettos (the best-known instance being the Warsaw ghetto revolt of April 1943) or even in the camps, although hopeless, carried the utmost symbolic significance. As for the immense majority of European Jews, they had practically no options even when impending murder was obvious: flight and hiding were limited options; despair and numbness, overwhelming.

Abstract

Discussions on the human 'home' and related categories always oscillates between emotionally charged categories of belonging and more practical reasonings about the location of persons and groups in the world – one argument today being represented by the 'invention of tradition' approach, the other recently tending towards sociobiological and ethological claims about the existence of a human instinct which orientates us towards total 'environs' or natural habitats. This article enquires into very different ways of constructing material and spiritual homes, trying to show that the striving for a 'home' might be a human universal, but that, on the other side, the ideal is never totally realized, as human fragility and dispersal drives us always and again away from our homes. In the era of 'moving targets,' anthropological fieldwork has partly lost its central referent: the small group presumably inhabiting a restricted area since immemorial times. However, we should acknowledge that humans all over the world are struggling to recreate homes under the impact of growing mobility and globalization. The anthropological field therefore re-emerges over again, sometimes 'under fire,' sometimes through more peaceful visits of anthropologists to other people's homes.

Definition and Meaning of 'Home'

The term 'home,' being of Anglo-Saxon and Germanic origins, often carries rational and irrational connotations at the same time: house, landscape, habitat versus place of belonging, object of nostalgia, place of origin. The German equivalents, *Heim* and *Heimat,* originally meant 'house' and 'owned land,' but later on denoted ideal and material spaces offering homeliness or German *Gemütlichkeit.* Not coincidentally, the term *Heimat* was re-introduced into the German written language through the reception of British gothic ideas and romanticism. Moreover, *Heimat* was adapted by many other languages as a lean word signifying a mixture of connotations all tending towards an emotionalized interpretation of the place a person feels adapted to: 'my home is my castle.' While loaded with emotional charge, the term 'home' usually also carries allusions to very profane and unromantic connotations, such as in the euphemistic names given to institutions catering for the poor, old, and disabled, or in the meanings expressed by the untranslatable German term *unheimlich* (the 'uncanny' of Freudian philosophy).

Anthropologically relevant references to 'home' initially appeared during the nineteenth century in Anglo-Saxon and German romantic and gothic styles of writing in which it denoted *Ur-Heimaten* or certain groups of humankind, such as the 'Aryan' origins in Asia or people's origins in other 'cradles' (Kuper 1988). Later on the term 'home' acquired a more specific political meaning as in the case of the 'homelands' assigned by the South African apartheid regime to ethnicized groups of 'black' citizens, which had the purpose of containing them in reservations or similar constructions of 'home rule.' More recently, the term has gained some significance again in anthropological studies of migrant, diaspora, and fugitive populations (Malkki 1995; Vertovec and Cohen 1999).

The related discussions move between two poles, one pole being represented by the 'invention of tradition' approach (Hobsbawm and Ranger 1982), and the other pole tending towards sociobiological and ethological claims about the existence of a human instinct which orientates us towards distinct 'environs' or natural habitats (Wilson 1975). From an anthropological perspective, the often rather unreflected and untheorized use of the term 'home' in scientific texts offers a good opportunity for checking the process of translation between European and non-European cultures. For the discussion of universalistic assumptions about a human drive for being 'at home' involves very heterogeneous forms of belonging, alienation, or indifference towards a 'home.' Often the 'drive' to be at home seems quite easily contented with illusions of a spiritual home; yet in some cases historical processes lead to violent conflicts about presumed 'home countries' between certain groups.

Mary Douglas (1966) introduced anthropologists to a world of symbolic attributions, in which the body can signify everything, and everything can mean the body. The same applies to homes, when looked at as a rational construction of territorial belonging on the one hand, and as an image of embeddedness in a particular social and geographical landscape, or nostalgia about such a situation, on the other.

Ways of Being 'At Home'

Obviously, the portable shelter constructed by a group of Kung hunters and gatherers is not the same as the proverbial British or German 'castle.' Anthropologists observed, however, that so-called bush people in Africa, traditional Australian aborigines, as well as groups inhabiting the rainforests of South Asia and South America, have developed elaborate systems of navigation in their regions, based for example on landmarks or tactile qualities of the ground (Widlok 1997). In the nineteenth century, Australian aborigines imagined their ancestors to wander around and with their actions invent the current topographical shape of their habitat. In so doing they related to the 'ground' in a way not at all alien to European conceptions of identity defined by geographical, social, genealogical, and individual physical characteristics of a given group in a given area (Spencer and

Gillen 1938). Attracted by some of the benefits of provincial town life or driven away by colonial powers from their places, their twentieth-century descendants may insist on returning to their promised lands, if their means of living allow such a step (Berndt 1977). Welfare programs can thus paradoxically lead to a partial return to traditional ways of living and especially of nurturing their ancestors' grounds. However, often we are no longer able to discern whether indigenous nativists adhere to old projections of a social and spiritual life onto certain 'hunting grounds' and places of survival through gathering activities, or whether this just follows Western concepts of belonging, grounded and capitalizing on geographical features of a given area.

There is varied ethnographic and mythological evidence of responses to loss of old nurturing grounds, including the wish to re-enchant the relationship between humans, heaven, and nature, although so far there is not enough comparative research available on the symbolism of land and house. Yet there is some evidence that human groups that succeed in storing greater amounts of food develop more closely-knit local mythologies bound up with the topography of landmarks, human dwellings, places for growing and harvesting food, as well as holy places. Horticulturists and cattle-breeding populations living in segmentary societies or low-grade forms of centralization tend to organize the household, the surrounding area, and faraway places that are of interest to the group by socially constructing ancestors and territorial spirits or divinities (Lienhardt 1961, Levi-Strauss 1955). The 'juridic domain' (Fortes 1969) concerning the simple facts of life – dwelling together, dividing up food, working a territory, keeping a herd, and maintaining property rights – is thus organized by an explicit ideology of belonging, descent, holy grounds, and the profane (Kramer and Kramer-Marx 1993). A supernatural interpretation of shrines and natural features, even of artificially organized biotopes, can be the territorial expression of a temporal cult of vegetation which unites social groups in a harmonious view of the ego, the household, the family, and other related persons with its ground, including all the plants and animals living or to be raised therein (Turner 1969).

A 'system of total exchange' (Mauss 1960), of generalized reciprocity, seems to pervade and bind human groups and their natural surroundings together. Paradoxically, this can privilege those groups which have reasons to claim to have been the first humans in a particular region and can give them a superior status, heavily defended in conflict, or lost and exchanged with the status of a pariah. The conflict between Hutu and Tutsi in Central Africa has had such a component (Maquet 1961). In a time of international arms traffic, and armed interventions into local cultures, tensions of this kind can lead to severe cases of mass violence.

There is a definite difference between such closely knit groups or networks of groups and the nation states of world society, in so far as the 'total social fact' (Mauss 1960) of traditional societies is organized into a tight overlapping of the domains of landscape, social structure, cosmology, etc. (Fortes 1969). The father or uncle can be the earthmaster, celebrating a holy shrine, and the next moment he can be the leader of a group of young warriors. This does not mean, though, that the social reality of these groups is more homogeneous than ours. Whilst subscribing, like their fellows, to a certain degree to the governing harmonious ideology of space, time, and home, some outsiders, skeptics, and dissidents always disagree and hold rational or disenchanted views of their group's attempts to maintain a homeland (Radin 1957).

By exchanging 'stigma' for 'charisma,' such outsiders can strongly affect or change their society. Thus, the classical 'big men' of New Guinea who constructed the 'pig festival' through the vegetational and reproductive cycles draw on a whole system of credits and cliental relations countering the heroic culture of the 'great men' who search for the spiritual gratification of the warrior (Godelier 1982). Early imperialist states seem to have been based on a similar mixture of exploiting nature, fellow, and other groups, on the one hand, and heroic fantasies about extending a holy landscape to other regions, on the other (Wolf 1999).

The study of nomadism might be particularly instructive with respect to human ideas about finding or having a home (Mauss 1960). For the layperson, nomads just seem to wander around without clearly relating to certain features of the landscapes. The experience of wandering and fugitive groups in Europe, such as the Sinti, Roma, and many others, may support this conception of a 'wandering' part of humanity that does not feel bound to certain cycles of exchange. Wanderers are always suspect to sedentary populations, and this resentment can remain through long periods of sedentarization, if it is supported by political powers. One of the starting points of German anthropology in the nineteenth century was a series of heated discussions about whether or not Jews felt any obligation of fairness and civil behavior towards non-Hebrew populations (Gilman 1990).

In the anthropological data, nomadic constructions of a unified horizon of landscapes abound, as does information on nomads treating their tents, carriages, or cars as 'mobile homes' (Rao 1987). Motifs in Oriental carpets, manufactured by nomads, often appear to carry the signum of descent and territorial rights as well as some kind of report of the group's history and historical claims for grounds and herds (Schuster and Carpenter 1996).

Not only nomadic populations but many other groups convey an ideal of homogeneity, tradition, and *mise en scene* of an environment of 'being at home' through their material culture, such as dress and costumes. This continues right up to European medieval, Ottoman, and today's international regulations of clothing and corporeal signs. Also the often painfully achieved imprints on the skins of members of more marginal populations seem to have the same rational and spiritual aim of demonstrating a form of belonging together (Clastres 1973). It is the invention of an 'environment,' in the sense that this term is used in modern art. Human environmental creativity ascribes to a certain space the property of being a home. These autopoietic processes of representing and creating an order of time, space, and body are perhaps most obvious in rural societies with their regional and class-bound costumes, their festivals, shrines, and clear-cut regional polities of power.

But even in the case of feudal societies, which often enough did not allow their underclass members to leave their 'homes' – even in this continuum of slavery on the one hand and enthusiasm for one's own 'ground' on the other – we can find distinct groups who, through historical experience or the

subtleties of property rights, seem to have acquired a very distanciated attitude towards their houses, fields, and cattle (Lopreato 1967). In times of famine or collective violence, these groups were probably among the first to leave their grounds and wander to the cities or the promised lands, over the mountains and across seas, as soon as the opportunity was offered by the modernization of the world economy into the global capitalistic project.

Modern and Postmodern Homes

In cities and other modernized landscapes, anthropologists have observed distinct techniques deployed in designing the 'home' of migrated groups or former peasant inhabitants of the area (Hannerz 1980). Conscious city design, the building of ghettos for reasons of controlling the 'bio-power,' and the process of identity formation in subgroups of a given population all go hand in hand here. Homeland associations as well as informal networks amongst industrial workers and employees ascribe to their private and sometimes also their professional life characteristics of tribal life. The elite of industrialized areas tend to form closely-knit networks, sometimes secret, sometimes formally recognizable, which transform their actors into something reminiscent of the earthmasters and segmentary war chiefs as encountered in traditional societies.

In the third millennium, two-thirds of the world population are expected to live such a metropolitan way of life, and from what we know about the older metropolitan areas in the world, we can deduce that the postmodern metropolis will be partly made by neighborhoods defining and defending themselves like traditional 'villages in the city,' like those in Naples, Cairo, Rio de Janeiro, or New York. These 'lieux' and 'milieux' of trust and similarity will be defined by criteria of class and taste as well as ethnicity and religious confession. Homelessness will abound as well as those of the better off desperate to (re)create a home as an anchor to a very mobile style of life (Dehavenon 1999). The inhabitants of big cities try to overcome the anomic atmosphere of 'non-lieux' by staging and topographically creating city life through festivals and customs, charity and sport events, as well as a home life through decoration, invitations of friends, meals, and so on (Augé 1992; Cieraad 1999).

In addition to the withdrawals and the small refuges of identity, however, an extension of the word 'home' has become important. With the advent of the nation states, millions and even billions of humans can unite in very large conglomerations of landscapes, and by means of national symbolism they try to find not only a common political but also symbolic denominator. An organicist idea of the state – 'a sound family makes a sound state' (Norman 1991) – may help to transfer feelings which were originally connected with house, family, regional polity, and local religion to the higher spheres of a fatherland united in the sign of a mother language, a home country (Gellner 1998).

This is where ethnicizing or nationalizing politics have often overlapped with anthropological science, a science often intended historically as a kind of school for learning how to invent nations. Not only under Hitler and Stalin did the 'nations of anthropology' (Borneman 1995) stand in close conjunction with their host nations, so did American cultural anthropology and other well-respected disciplines.

Today's 'United Nations' comprise groups that are divided by very different models of inventing traditions as well as interior constructions. Some of them are founded on the basis of the one and only territory alone, others claim that a common language, cultural heritage, race, or historical traumatization provide the fundament of their existence. However, the whole system of nations nowadays demands that no single person, house, or territory can be without a host nation. This is supported by older ethnographic constructions, which always attributed a group of people to a certain territory. Today, such origins of ethnic topographies frequently turn into a topography of terror, while at the same time international movements of refugees and migration make such attributions obsolete. Another form of homebuilding, however, will apparently continue to exist even in the most technologically advanced systems on Earth. Against all the prognostics of the social sciences, the 'home' seems to survive even its most important carrier, the family. Statistical evidence indicates that single households abound in all metropolitan areas of the world, yet this 'yuppie' culture maintains that people ought to belong to some house, some household (often lovingly decorated and furnished), a certain area, a group of friends and colleagues. Big festivals like Christmas – which is, indeed, the only feast of a truly international character celebrated today, not only in the West but in most parts of the world including China and Africa – provide this 'home' with an anchor in time and space. Groups of families and friends reunite during these days to have traditional forms of communality, exchange, and mythopoesis about a bearded old man leaving his occult home in the last area on the world that still proves unreachable for globalization, the polar circle, carrying with him gifts and goods that will help to make people feel more at home (Miller 1993).

Final Thoughts

In the era of 'moving targets' (Marcus 1999), anthropological fieldwork has partly lost its central referent: the small group inhabiting a restricted area since immemorial times – the field. However, it seems that humans all over the world are struggling to recreate homes under the circumstances created by today's form of globalization. The anthropological 'field' therefore re-emerges over and over again, sometimes 'under fire' (Nordstrom 1995) and sometimes in a peaceful dialogue with the anthropologist, that 'professional stranger' who leaves his home to study others' homes.

Homelessness in the United States

Martha R Burt, Urban Institute, Washington, DC, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Homelessness has now been a fixture on the political scene in the United States for three decades. The scope of the problem has not been debated for more than a decade, thanks to regular nationwide counts and prevalence estimates. Progress is being made on reducing and ending homelessness, using several approaches that have been evolving since 2000, some more recently than others, amid continuing debate. This article examines definitions of homelessness in the United States and how useful estimates of population size and dynamics have been established since 2007. It then provides basic descriptive information about homelessness in the United States, looks at its patterns and antecedents, describes the growth of homeless-specific service programs, and reviews research on the costs of homelessness. It ends with probable future directions for homeless research and policy.

Defining Homelessness

Homelessness did not exist as a public policy issue from the end of the Great Depression until the early 1980s. Even with increasing public monies flowing to homeless service agencies as the 1980s progressed, no formal definition of homelessness was available until Congress passed the Stewart B. McKinney Homeless Assistance Act of 1987, and even then the definition varied, and still does vary in different federal agencies, depending on the goals of their homeless assistance programs. The Department of Housing and Urban Development (HUD) is the only federal agency given responsibility for reducing the number of homeless people in the country, and thus the one whose definition has had the greatest reach and impact. Since 1987, HUD has defined people as literally homeless if they sleep in a shelter for homeless people or in places not meant for human habitation such as vehicles, abandoned building, outdoor locations, or transportation facilities or stations. Over the years this definition has expanded to include people at imminent risk of homelessness because they cannot stay where they are and have no housing alternatives, and other adjustments have been made to accommodate the needs of particular federally funded programs. The US Department of Education has a different definition of homelessness, pertinent to its mission to assure that children affected by parental homelessness can continue their education, with a priority of receiving it in their original school.

For programmatic purposes and to target resources, HUD also defines a condition known as chronic homelessness, for which a person must have at least one disability that impairs functioning and have been homeless for at least a year or for at least 12 months out of the previous 3 years. This definition applied initially only to single adults, but was expanded with 2009 legislation to include a parent in a homeless family.

Homeless Numbers

Due to the previously described changes in the definition of homelessness, there are no good estimates of the size of the literally homeless population for the 1960s and 1970s. The best guess is that in the late 1970s formal shelters (i.e., missions) for people experiencing homelessness might have been able to accommodate about 50 000 people at any one time in the entire country, and that the number of literally homeless people probably was no more than 100 000 and could have been considerably less. Even through much of the 1980s, before HUD established its definition of literal homelessness, studies of people experiencing homelessness in the United States used study-specific definitions of homelessness. By 1984 the point-in-time (PIT) estimate was up to 250 000–300 000, based largely on the perceptions of local service providers. The first study to use a statistically valid, nationwide, sampling methodology (Burt and Cohen, 1989) occurred in 1987 and produced a point-in-time estimate of 500 000–600 000 people.

After HUD established its definition, to be credible studies had to use it as the basis for at least their core population estimate, even if they also described people facing a housing crisis who might not yet meet the full definition of literal homelessness. This was the case for the next nationally representative study performed, the National Survey of Homeless Assistance Providers and Clients (Burt et al., 2001), whose data were collected in 1996. It estimated that between 444 000 (for October) and 842 000 (for February) persons *used homeless assistance programs* (*not all* were homeless people) on any given day. All of these numbers include any children accompanying a homeless adult, but not runaway and homeless youth.

HUD began collecting information about homeless populations and services for the United States as a whole in 2005, and believed it to be sufficiently reliable by 2007 to start reporting it to Congress in Annual Homeless Assessment Reports, which have been improving in accuracy and completeness since that time (HUD 2008–12). Included in its statistics are (1) data that HUD requires most communities in the country to collect at a specific point in time (PIT), during a 24-h period usually done in the last week of January, for unsheltered as well as sheltered people (this count is required every other year, but many communities do it annually) and (2) continually for users of emergency shelters and transitional housing programs to produce an annual prevalence figure. Both are lower bound estimates, but at least they are consistent from year to year.

PIT counts have dropped slightly between 2007, when almost 672 000 people were counted, and 2011, when about 636 000 people were counted. The drop was almost entirely in the unsheltered count (down 13%), which largely includes single adults, and reflects policies emphasizing supportive housing for people who have been homeless for years and have significant levels of disability. One-year estimates of sheltered homeless people are also down between 2007 and 2011, from about 1.6 million to 1.5 million people, or about 5%. But the trend for sheltered families was in the opposite direction. Sheltered family households increased 28% between 2007 and 2010, due to the Great Recession that began toward the end of 2007 and combined massive unemployment with housing loss due to foreclosures. Families using shelter began to decline by 2011, but still remained almost 14% higher than was the case in 2007.

Major Characteristics of Homeless People in the United States

Demographic Characteristics

Characteristics of people experiencing homelessness come from computerized data collected continuously in communities throughout the country to reflect *shelter and transitional housing users* over the course of a year (USDHUD, 2012 – no similar information is available for homeless people who never used a shelter throughout the year). In 2011, 63% of persons in shelter were single adults, a decline from 70% in 2007 due to the increase in sheltered homeless families. Of single adults in shelter, 72% were male; 45% were white non-Hispanics, 35% were African American non-Hispanics, and 8% were Hispanic; 70% were between 31 and 61 years old; and 43% had at least one disability – characteristics that fluctuated by one or two percentage points from year to year. Slightly more than one in three stayed in shelter for a week or less out of the reporting year, and about three in five stayed less than a month.

Of persons in homeless families using shelter in 2011, 60% were children. Among the adults, 79% were female; 28% were white non-Hispanics, 44% were African American non-Hispanics, and 21% were Hispanic; 56% were between 18 and 30 years old and another 41% were ages 31–50. Only 16% of adults in homeless families had a disability. About one in four stayed in shelter for a week or less out of the reporting year, and about half stayed less than a month.

("Other Characteristics," reported in the original, are not available from the Annual Homeless Assessment Report, and the 1996 data are too old to use.)

Patterns of Homelessness

Research on patterns of homelessness in the early 1990s (Culhane and Kuhn, 1998) differentiated three patterns of homelessness among single adults in New York and Philadelphia – first-time/crisis/transitional, episodic, and chronic – that subsequent research has been confirmed in other cities and later years. The first and largest group includes people who are homeless only once or twice and usually for a relatively short period of time (e.g., less than 3, 6, or 12 months). Often they have been precariously housed and find themselves homeless after an unexpected crisis such as unemployment, divorce/separation, or eviction. They usually secure some type of housing relatively quickly and often do not become homeless again. Episodically homeless people are defined by their pattern of cycling in and out of homelessness over significant periods of time. Chronically homeless adults, the smallest group, have relied on shelters or lived on the streets for many months or years, and many also spend time in various institutions such as inpatient treatment centers, detoxification programs, and jails. PIT studies, which overestimate the proportion of homeless people with long spells, usually find that about one-quarter of homeless adults are in the first group, and that half or more have extensive histories of either episodic or continuous homelessness. Studies that are able to observe flows into and out of the homeless condition over time give a different picture, showing only 10–20% with long-term homelessness and up to half with quite short-term or crisis patterns (Culhane and Hornburg, 1997: 101–134). More recent research confirms this picture (USDHUD, 2012).

The chronic, long-term homeless may have only a few distinct spells of homelessness, but each one lasts for a very long time; they have a high prevalence of disabilities that pose barriers to securing stable employment and housing. They absorb a highly disproportional share, often 40–50%, of homeless assistance and other resources and, for this reason, have been the focus of public policy initiatives to create supportive housing that they will accept and that ends their homelessness.

More recent research on homelessness patterns among families (Culhane et al., 2011) finds the same three patterns but the characteristics of the episodic and chronic/long-term groups are reversed. Among families, those using shelter and transitional housing programs for more than a year tend to be the *most* stable and have the most human capital, but are waiting in homeless assistance programs until they receive a rent subsidy. The episodic group of families is the smallest (about 8%), and more closely resembles the long-time homeless single adults in spending more time in other institutions when not in the shelter system.

Antecedents of or Factors Associated with Homelessness

Both societal and personal factors affect homelessness. The societal factors predict *when* and *where* homeless populations will increase or decrease; the personal factors help to predict *who* will be vulnerable to these societal pressures. The two sides of the equation determining the ability to afford housing are household income and housing costs. In the United States, housing costs for the lowest-cost units have increased significantly since the mid-1980s, while the earning ability of most people has continued to decline. Homelessness most recently became a public issue in the United States in the early 1980s, during a time of record-high unemployment (the recession of 1981–82) that reduced household income among both low-wage workers and workers in manufacturing, many of whom lost their jobs. The record prosperity of the United States during most of the 1990s into the 2000s and beyond has been accompanied by the development of a two-tiered labor market

that has relegated many people without a college or technical education to low-paying service jobs and produced the highest levels of income inequality for more than 50 years. At the same time, wealthier households have pushed housing costs to record-high levels. The differential between earning power and housing costs sets the societal stage for homelessness. A public safety net of housing and other programs could assure that households do not founder under such circumstances, but US public policy has moved in the other direction.

That being said, certain people are more likely than others to become homeless. Poverty is the *sine qua non* of homelessness. The explanatory value of demographic characteristics such as race/ethnicity diminish or disappear in many analyses that simultaneously include income variables plus characteristics such as physical health, childhood experiences, and variables relating to alcohol and drug use and mental health problems. Regression results from an increasing number of studies on both families and singles confirm that sexual or physical abuse by a household member, foster care, or other out-of-home placement in childhood differentiate both homeless families and homeless singles from their housed counterparts. Physical and mental health conditions in adulthood, and early and current alcohol or drug use are also usually found to increase the probability that a person will experience homelessness when other things are held constant.

Growth in Shelter/Housing Capacity

Residential components of US homeless assistance have grown tremendously since the early 1980s, but different segments have seen growth at different times. Growth first occurred in emergency shelter, which went from a rough estimate of 100 000 beds in 1984 to 275 000 in 1988, according to USDHUD estimates. But there growth mostly stopped; the estimate of emergency shelter capacity for 1996 was about 239 000 beds, for 2007 it was about 211 000 beds, and for 2011 it was about 226 000 beds.

In contrast, system capacity for transitional housing and permanent supportive housing (PSH), which barely existed before 1990, has expanded greatly. The major growth in transitional housing occurred in the 1990s, with about 160 000 beds by 1996 and 211 000 beds by 2007. It has recently been in decline due to policy changes, and totaled about 202 000 in 2011. The Expansion of PSH began even later and is still increasing, again due to policy emphasis. The 1996 estimates were for about 114 000 PSH beds, which rose to about 189 000 beds in 2007 and reached about 267 000 beds by 2011, with more on the way. This growth coincided with the initial availability and eventual expansion of federal funding for new types of shelter/housing stimulated by homeless legislation, to which many local initiatives have added resources, mostly for PSH.

Policy Changes and Their Relationship to Evidence of Effectiveness

In 2000 and thereafter, major efforts in the United States have focused on ending long-term homelessness for persons with complex health needs and disabling conditions by providing PSH. Motivations for this strategy are twofold: avoiding the costs incurred when this population uses expensive crisis public services, and improving health outcomes. The findings of numerous studies amply attest to reductions in crisis public service use and cost when chronically homeless people move into PSH (summarized in Culhane et al., 2007; Burt et al., 2011). A very extensive and complex study in Los Angeles (Flaming et al., 2009) examined service use across nine public agencies for over 10 000 recipients of General Relief, many of them homeless. The study found cost offsets for housing placement while considering several levels of service need and use of services. Along with numerous other studies, the Los Angeles research showed that public costs go down when individuals are no longer homeless. It also showed the benefits of the more costly services accompanying PSH for the sickest and most disabled persons – the first time that the effect of services per se, distinct from just the housing, can be clearly detected in both health outcomes and cost offsets.

Advocates used the evidence for cost avoidance, along with results showing that agencies providing PSH could move long-term homeless people with significant levels of disability off the streets and keep them housed, and documentation that the number of disabled chronically homeless individuals was small enough to be manageable, to encourage federal decision makers to adopt a change in national policy – toward a commitment to ending chronic homelessness. Many communities across the country followed suit, leading to more than doubling the availability of PSH units in the 2000s, as noted above. The result has been documented declines in chronic homelessness (USDHUD, 2012).

Other policy emphases in recent years include a major federal investment ($1.5 billion) in homelessness prevention and rapid rehousing through the Homelessness Prevention and Rapid Rehousing Program, which ran from 2009 through early 2012 as a response to the severe economic downturn then prevailing. Compared to PSH, however, much less evidence exists to document the effectiveness of these strategies.

Future Directions for Policy and Research

In the United States the argument has come full circle after almost three decades. The notion that homelessness was a problem of 'housing, housing, and housing' was made forcefully in the early 1980s, and has now proved to be quite accurate. Service programs have helped many homeless people in many ways. But to help people leave homelessness for good, or to divert people from entering into homelessness, the resources required are housing resources. These include help with landlords, back rent, evictions, and move-in expenses as diversion outlays, and actual housing as a means to end homelessness.

Future research could profitably take two directions. The first direction would focus on what supports or services made available *just before* a homeless episode or at the moment of its precipitating event could avert the transition to literal homelessness by stabilizing the situation or simply redefining

the issue. For instance, some community support services for persons with chronic mental illness offer 'respite' facilities where a person can stay for several days during a crisis in their illness. Respite stays avert complete dissolution of the person's life in the community, including loss of housing. It would be important to learn how these types of interventions can work best, for whom, and when. The second direction for research would focus on what services *in addition to housing* would make the most difference for people who are already homeless. Some communities in the United States have already shifted resources from emergency shelter and transitional housing programs to affordable and supported housing, actually reducing the need for emergency shelter beds. More attention needs to be focused on developing a range of such approaches, because it should be clear that continuing to increase the capacity of the homeless service network will only serve to bring more and more people into the category of homeless.

Abstract

This article synthesizes the large volume of literature on structural and individual correlates of homicide offending. The cross-national research on poverty, inequality, family structure, segregation, racial and ethnic composition, and population structure is reviewed. Individual level studies are summarized with respect to their findings on gender, race and ethnicity, age, relationship between victim and offender, circumstances, alcohol and drug use, and prior criminal record. The article concludes with a discussion of homicide prevention strategies.

A vast literature exists on the subject of homicide. The research in this area can be grouped broadly into aggregate-level studies that explain variation in homicide rates across cities, counties, states, regions, and countries, and individual-level studies that examine the victim, offender, incident, and situational contexts of homicide events.

Aggregate-Level Studies

Wide geographic variation exists in homicide rates. As will be described in more detail, the major theoretical perspectives that have been applied to explaining this variation include strain, social disorganization, opportunity, and social control perspectives.

Concentrated Poverty

Disparities in concentrations of poverty have been a focal point of a number of aggregate-level studies on homicide. Macro-level strain theories view these concentrations as an indication of the extent to which individuals are blocked from accessing legitimate means to attain culturally defined goals related to material success. Concentrations of poverty are also central to the arguments of social disorganization theorists, who emphasize the barriers it creates to the development of collective efficacy within neighborhoods and communities. In areas with high concentrations of poverty, unemployment, and female-headed households, neighbors are unlikely to develop the kinds of feelings of mutual trust and cohesion that provide the basis for informal social control of residents' behavior.

Studies conducted using geographic units within the United States consistently find that poverty is related to homicide rates. Recent cross-national research also supports the view that poverty is a significant structural correlate of homicide rates internationally.

Inequality

Considerable debate exists concerning the importance of relative versus absolute poverty in the production of high homicide rates in particular geographic locations. Those who argue for the importance of relative poverty believe that the disparity between one's own socioeconomic position and those around them is more likely to produce strain and motivation to use illegal means to achieve a similar standard than living in areas in which essentially no one has a high standard of living.

Various types of inequality have been examined for their relationship to homicide, including economic, racial, and gender inequality. Economic inequality has received the most attention of these inequalities. Beginning with the prominent study conducted by Blau and Blau (1982), measures of economic inequality have been assessed as a major structural correlate of homicide rates on a variety of geographic levels. Economic inequality can be expected to produce high homicide rates for several reasons. In line with the arguments of strain theorists, economic inequality may reflect blocked aspirations and opportunities for the least fortunate. In addition, economic inequality generates relative deprivation. As Jacobs and Richardson (2008: p. 31) argued, "In contrast to absolute poverty, visible economic disparities and the resulting unfavorable comparisons magnify the natural suspicions held by the least fortunate that the social procedures used to distribute rewards are not just."

The most widely used measure of inequality in this body of research is the Gini coefficient. The Gini coefficient ranges from a score of 0 (complete equality) to 1 (complete inequality) and is a reflection of how much area exists between the Lorenz curve and the line of equality (*see* Inequality Measurement).

Economic inequality has been found to explain variation in homicide rates across U.S. counties. Within the cross-national literature on homicide, inequality has emerged as an important predictor of variations in homicide rates across nations. Pridemore (2011), however, has argued that cross-national studies that find inequality to have a significant, positive relationship with homicide fail to control for poverty, and that once poverty is included in the model, any significant effect of inequality tends to disappear. Several studies support this position.

Racial Inequality

Research examining the association between racial inequality and homicide addresses the question of whether structural disparities between racial groups are a greater catalyst for lethal violence than economic inequality in general.

The findings with respect to the impact of racial inequality on homicide rates are mixed and appear to depend on the type of homicide examined. For example, racial inequality has been shown to be related to intraracial homicide offending; however, racial inequality does not appear to predict homicide offending between racial groups (i.e., interracial homicides).

Family Structure

Family structure measures commonly are included in aggregate-level studies of homicide rates. They typically serve as proxies for the level of informal social control in a given area. Locations with high proportions of female-headed households, for example, are theorized to exercise less supervision over residents. Furthermore, single-parent families do not have the time, energy, or financial resources to develop significant relationships with neighbors or to mobilize their community to address common problems. Thus, unchecked, violent crime in these areas will flourish. The prevalence of female-headed households is consistently a strong and significant predictor of homicide rates.

The divorce rate and the percent of males that are divorced also have been widely used in aggregate studies of homicide rates. The divorce rate is another means of tapping into the prevalence of one-parent families and is expected to be associated with homicide rates for the same theoretical reasons as the share of female-headed households. In other words, high levels of family disruption resulting from divorce weaken both formal and informal social controls, consistent with a structural–control perspective. Furthermore, divorce can generate additional interpersonal conflict between exspouses, directly contributing to increased rates of intimate partner homicides. From a normative conflict perspective, high divorce rates are symptomatic of a widespread collapse of traditional institutions beyond the family and may produce disorganization in which multiple family forms seek to coexist. Studies of the United States find that when examined outside of a disadvantage index, the divorce rate has a significant positive effect on homicide rates.

The percent of divorced males, on the other hand, is interpreted more commonly from a routine activities and lifestyle perspective. More specifically, a higher prevalence of divorced males in the population may be indicative of more men frequenting high-risk locations (e.g., bars, nightclubs) and engaging in high-risk behaviors that increase their attractiveness as targets and increase their contact with motivated offenders.

Racial Residential Segregation

Residential segregation often is operationalized using the index of dissimilarity, D, which measures the maximum vertical line between the Lorenz curve and the diagonal line of evenness. In essence, it provides an indication of what percent of a group's population would need to move to realize an even distribution. Other measures of residential segregation include Lieberson's (1981) P^* index.

Within the United States, this area of research has focused largely on the residential segregation experienced by African Americans, but recently it has expanded to include an examination of residential segregation among Hispanics. The extent to which racial residential segregation affects homicide victimization varies depending on the measure of segregation used.

Disadvantage Indexes

Strong interrelationships among structural correlates of violence cause significant difficulties in trying to estimate their unique impacts on homicide rates. Researchers typically have handled these problems with multicolinearity among the explanatory variables by using principal components analysis to identify common factors. Although the specific combination of variables included in the factor analysis varies across studies, the most common types of factors generated are a disadvantage–resource deprivation index (typically composed of measures of poverty, income, unemployment, and family structure but also may include inequality and racial residential segregation), residential instability (i.e., proportion of renters, vacancies, residents who have moved within past 5 years), and population structure (population size and density).

The disadvantage index is most consistently associated with homicide rates across units of analysis. The association between concentrated disadvantage and homicide may be more complex than a straightforward unconditional linear relationship. There is some indication, for example, that its influence is conditional upon the type of homicide examined. Furthermore, its impact among certain subgroups may be nonlinear such that the effect tops out after a certain point.

Racial and Ethnic Composition

The inclusion of measures of the relative size of racial or ethnic minority groups within an area is a relatively common practice in homicide research. Among studies conducted in the United States, it has become virtually routine to include a measure of the percent of the population that is black in multivariate analyses of homicide rates. Often, percent black is relegated to the role of a control variable. It is viewed by many as an indirect measure of Wolfgang and Ferracuti's subculture of violence in which subcultural values supporting the use of violence are argued to develop among groups of urban minority males. A positive relationship between percent black and homicide rates has emerged in a number of studies. Negative or nonsignificant relationships also are common and often are argued to support a benign neglect hypothesis.

Measures of the relative size of other minority groups, such as Hispanics and Native Americans, have become more common in the homicide literature in recent years. Their impact on homicide rates is not consistently significant.

Population Size and Density

Aspects of population structure, such as size and density, generally serve as indicators of criminal opportunity. Routine activities and opportunity theories argue that variation in offenses across time and space are driven in part by differences in opportunity structure. Greater access by motivated offenders to attractive targets in the absence of guardianship will generate higher levels of violent crime. All else being equal, areas with

larger numbers of residents will include more motivated offenders and suitable targets (*see* Routine Activities, Criminal Opportunities, Crime and Crime Prevention).

Analyses of population size and density measures have produced mixed findings. When significant, the effect is positive, supporting arguments that areas with larger populations will have increased homicide rates.

Individual-Level Studies

Research examining collections of homicide cases has produced a body of knowledge on the characteristics of homicide victims, perpetrators, and incidents. These characteristics of homicide identified in individual-level studies are summarized in the following sections.

Gender

A universal feature of homicide studies is the overrepresentation of males as perpetrators. Males are also disproportionately victims of homicide. The higher prevalence of homicide by male offenders has been explained by a variety of biological, psychological, and sociological factors. Biosocial theories have emphasized an interaction between biological and environmental factors. Although several biological traits have been shown to be associated with increased aggression in males, such as high testosterone, impulsivity, and low empathy, environmental factors can both facilitate and constrain their influences. Sociological theories stress the role of social learning processes, differential opportunities, subcultural influences, lifestyle differences, and gender role socialization practices in producing the well-established gender disparities in homicide offending and victimization.

One of the few exceptions to the general pattern of men's disproportionate involvement in lethal violence is the significant share of female victims killed by intimate partners. Research conducted across a number of countries has demonstrated the central role of male sexual jealousy and proprietariness in domestic violence, generally, and women killed by their abusers, specifically. The two main perspectives regarding the source of male sexual jealousy and their desire to control women are feminist theories and evolutionary psychology. For feminist theorists, the foundation of the jealousy and control lie in patriarchal social structures and cultural processes. For evolutionary psychologists, the universal nature of the overrepresentation of males in lethal violence and the common situational context and motives driving men to kill women worldwide is not consistent with the notion that their basis is entirely social or cultural. In their view, sexual proprietariness has developed among males in reaction to reproductive competition among men. The threat of losing sole access to a female partner due to perceived infidelity or her departure from the relationship would set off such a response among males.

The other general exception to this pattern is the involvement of women as perpetrators of infanticide and homicides of young children. Research on infanticide indicates that these often are committed after a hidden pregnancy to prevent parents from discovering the child's existence or when women (typically young girls) otherwise feel unable to care for the child. Infanticides often involve strangulation or suffocation of the victim where the victim's body subsequently is dumped or otherwise hidden from discovery. Cross-nationally, the most significant predictors of infant homicide victimization rates are female labor force participation and income inequality.

Race and Ethnicity

Racial and ethnic minorities often are involved disproportionately as victims and offenders of homicide. In the United States, the elevated risk of homicide among African Americans in particular is well documented. In Canada, the United States, and Australia, the native populations often have the highest rates of homicide offending and victimization. Ethnic minorities in many European countries also have elevated risks of homicide victimization. For example, in Finland, individuals of Roma descent have higher risks for homicide victimization; in Sweden, it is individuals of Yugoslavian descent; and, in the Netherlands, it is those of Antillean descent.

A number of theoretical perspectives have been applied to explain the overrepresentation of racial and ethnic minorities among homicide offenders and victims. Central to many of these arguments are the crime-producing effects of structural inequality and residential instability experienced by many minority group members. These sources of economic disadvantage in minority communities generate feelings of alienation, despair, and frustration, resulting in a greater prevalence of economically motivated homicides (i.e., those committed during a robbery or burglary) and also generating greater interpersonal conflict and hence dispute-related homicides.

Regarding the overrepresentation of African Americans as homicide offenders and victims within the United States specifically, explanations have emphasized the profound impact of the historical legacy of slavery and racism that has limited the opportunity for African Americans to achieve justice and resolve conflicts in everyday life through legitimate avenues. Within this context, violence often is viewed as self-help or as other manifestations of an alternative avenue of social control. This is particularly likely to occur in cases in which minority populations lack trust in the police and the criminal justice system more generally to provide just responses in dispute resolutions.

Age

As with other types of criminal offending, individuals in their late teens and early twenties are the most likely to be homicide offenders and victims. A number of sociological theories have been applied as explanations of the age distribution of homicide offending. In particular, the high concentration of homicide arrestees among young adults has been attributed to this age-group's low self-control, high impulsivity, weakened bonds and attachments to social institutions (e.g., family, schools, religion), and routine activities and lifestyles that expose them to risky and dangerous situations. In addition to maturational reform, changes occurring with respect to lifestyles and routine activities, increased stakes in conformity, and the development

of attachments to significant others as individuals enter into adulthood explain the lower levels of homicide offending in older age groups.

Relationship between Victim and Offender

In spite of the fear they generate, homicides committed by strangers constitute a minority of cases. People are most likely to be killed by someone known to them, particularly friends and acquaintances. Research indicates that the situational context underlying intimate partner, family, friend or acquaintance, and stranger homicides differs. Intimate partner homicides typically involve individuals of the same race and approximate age but the opposite sex. They are virtually the only type of homicide in which female victims outnumber male victims. Although the immediate precipitating event in these acts of lethal violence is often a dispute, intimate partner relationships that end in homicide almost always are characterized by a history of domestic violence against the female partner. Additional risk factors for intimate partner homicides, especially of female victims, include estrangement, forced sex, the presence of stepchildren in the home, violence during pregnancy, access to guns, prior incidents of stalking, threats to kill, and earlier episodes of choking or strangulation.

Family homicides are largely expressive acts of violence and often involve men killing other men. Within the United States, they are primarily committed with firearms. When they involve older participants (i.e., not children), they commonly involve alcohol use and fit the image of confrontational homicides, thus sharing situational characteristics with homicides involving friend and acquaintances.

Homicides occurring between friends and acquaintance homicides are largely the domain of males. Participants tend to be of similar age and racial background. Their situational contexts are typically dispute related. They often fit the image of character contests and begin as verbal confrontations that escalate into physical attacks. They occur disproportionately in the evenings, on weekends, and in public locations.

Stranger homicides involve a diverse array of situational contexts. They are more likely than other types of homicides to be instrumentally motivated and to be committed by males. Although some fit the typical conception of an innocent bystander or random victim killed by someone with whom they had no prior relationship, it is also common for stranger homicides to occur between individuals involved in criminal lifestyles (e.g., drug dealing, prostitution).

Circumstances

The literature frequently classifies homicides as expressive or instrumental. Expressive homicides are spontaneous, emotionally driven acts and are the most common situational context for lethal violence. Instrumental homicides are those that are motivated by prospective goals, including the acquisition of money or status. Homicides most commonly classified as instrumental are those occurring during the commission of other crimes, such as robberies and rapes. These types of homicides constitute a minority of homicides.

Expressive and instrumental homicides differ in terms of their situational context. Instrumental homicides are more likely to involve strangers, multiple offenders, young offenders, and men killing other men. In contrast, expressive homicides tend to involve older offenders, interracial attacks, and nonstrangers.

Expressive homicides often take the form of confrontational disputes involving character contests. Character contests involve defenses of one's social self in response to status threats, often in public in the presence of others. Prior disputes between the victim and offender are common. In some, the victim plays a contributory role by initiating the verbal confrontation or being the first to resort to physical violence, leading to their depiction as victim-precipitated homicides.

Homicides occurring within the context of illegal drug transactions are frequent circumstances for robbery homicides in many urban areas. Dealers are targeted as easy prey for ripping off both money and drugs given their lack of access to legal recourse. Disputes over quantity and quality of drugs, drug-selling territory, and drug debts also produce lethal confrontations in which robberies may occur as well.

High-profile types of homicides – such as mass murders, serial killers, and homicides committed by law enforcement – are rare and yet receive the most media attention.

Alcohol and Drug Use

It is common for both the victim and offender to have been consuming alcohol at the time of the homicide incident. Cross-nationally, approximately half of homicide victims are under the influence of alcohol when they are killed; about one-third would meet the threshold for intoxication. Alcohol use among homicide victims tends to increase with age. Inconsistent conclusions have emerged with respect to whether it is more common among female or male victims. A history of alcohol dependence is also relatively common among homicide offenders. Examinations of cross-cultural variations in the influence of alcohol on homicide have produced mixed findings. Some research reports that levels of alcohol use in homicides are relatively consistent across locations, but others conclude alcohol has a greater impact on homicide in specific countries (e.g., Russia).

Most theories of alcohol use and homicide focus on the impact of alcohol on an individual's cognitive functioning and reasoning. Alcohol reduces inhibitions and removes normative rules prohibiting the use of violence. This is particularly likely to be the case in situations in which active constraint is required in the sense that violence is perceived as an effective dispute-resolution mechanism given the dynamics of the specific situation.

Although not as prevalent, a quarter or more homicide victims are under the influence of illicit substances at the time of their death. As with alcohol, this has been explained by the influence of illicit substances on brain functioning, perception, and the creation of delusions and hallucinations. The overlap between individuals who use and sell drugs may be an equally important factor. The risk of violence to those involved in drug markets is well documented and remains one of the leading explanations for the tremendous upsurge in lethal violence in the late 1980s and early 1990s in the United States.

Prior Criminal Record

Prior criminal records are common among both homicide victims and offenders. The significant involvement of homicide

victims in criminal activity frequently has been cited as evidence in support of an overlap in populations of homicide offenders and victims. That a significant portion of homicide victims and offenders are drawn from the same population of individuals involved in deviant lifestyles is consistent with the arguments of a number of criminological theories. Chief among these are routine activities theory and the subculture of violence. The 'principle of homogamy' derived from lifestyle and routine activities theories asserts that a person's risk of victimization is correlated with the frequency with which they interact or have contact with members of demographic groups that account for a disproportionate share of offenders. To the extent that the subculture of violence thesis argues that subgroups of the population are geared normatively toward violence, shared perceptions and misperceptions regarding engagement in violence among both victims and offenders mean the two populations will not be distinct, instead interchanging roles in a system of subcultural relationships.

Prevention

Deterrence has been heavily relied on as a strategy for reducing crime generally and violent crime specifically. Although the exact deterrence strategies that have been used vary across countries, these approaches include the implementation of mandatory minimum sentences, the development of three-strikes laws, making it easier to process juvenile offenders as adults, and the use of the death penalty. In general, efforts to increase the severity of punishment have shown only limited success in reducing serious violent crime. More targeted strategies, however, such as those that take aim at the illegal carrying of firearms in high–violent crime areas and directed police patrols in those localities, have been shown to be effective.

As cynicism has mounted over the ability of the criminal justice system to reduce violence in general and lethal violence in particular, homicide prevention efforts increasingly have turned toward multiagency collaborations and public health approaches. Within the United States, successful programs such as Boston's Operation Ceasefire follow this model by having developed partnerships between a number of criminal justice agencies and local activist groups. The program relies on a strategy of 'pulling levers,' in which attention was focused on a small group of individuals involved in gang violence and trafficking illegal firearms. These chronic gang members are given a message of no tolerance for violence and every available legal 'lever' is used to respond to violence when it occurs to create a swift and intense response.

The implementation of death review committees composed of participants from a broad spectrum of social service and criminal justice agencies to conduct in-depth examinations of child fatalities, deaths from domestic violence, and – in a few instances – all homicides within a given jurisdiction have helped to identify system gaps and other policy changes that can prevent future homicides.

The preventive aspects of restricting the availability of alcohol establishments, increasing alcohol taxes, and making other efforts to reduce alcohol consumption are supported by a body of cross-national research on alcohol and homicide. Given the prevalence of alcohol and drug use among homicide offenders and victims, providing substance abuse treatment to those at risk for serious violence likely will yield long-term benefits in terms of homicide reduction. Increased access to mental health services, particularly among children exposed to violence, also has been shown to be a promising avenue.

Increased resources for domestic violence victims in the form of hotlines, shelters, and legal advocacy services; widespread use of lethality assessments in cases of nonlethal intimate partner violence; and the development and strict enforcement of policies prohibiting possession of firearms among individuals arrested for domestic violence are valuable approaches for preventing intimate partner homicides more specifically.

Abstract

Based on recent lexical studies across various languages, Honesty-Humility has been suggested as a sixth basic factor of personality. Specifically, according to the HEXACO Model of Personality, Honesty-Humility represents individual differences in active cooperativeness – operationalized via the facets sincerity, fairness, greed avoidance, and modesty. Herein, research corroborating Honesty-Humility as a basic personality factor is summarized and supplemented with an overview of the broad array of criteria this factor has been shown to influence. In addition, we briefly touch on aspects that are still understudied concerning Honesty-Humility, especially in terms of its biological basis, development, and broader societal consequences.

The personality factor named Honesty-Humility is defined as "the tendency to be fair and genuine in dealing with others, in the sense of cooperating with others even when one might exploit them without suffering retaliation" (Ashton and Lee, 2007: p. 156). Correspondingly, Honesty-Humility encompasses attributes such as being fair-minded, honest, modest, and sincere as opposed to being boastful, deceitful, greedy, and hypocritical (Ashton and Lee, 2008a). According to the HEXACO Model of Personality (Ashton and Lee, 2007), Honesty-Humility represents one of the (six) basic dimensions of personality, subsuming aspects of reciprocal altruism in terms of active cooperation. As such, Honesty-Humility has not only been considered an important construct for personality psychology, but also, more generally, for many socially important criteria (e.g., Ashton and Lee, 2008b; Dunlop et al., 2012; Lee et al., 2013). Herein, we describe the recovery of Honesty-Humility as a core personality factor, its theoretical and empirical background, various aspects it has been linked to, potential future directions, and (un)solved methodological issues.

Theoretical and Empirical Background

The recovery of Honesty-Humility as a basic personality factor can be traced to several recent lexical studies performed across different languages and cultures. The underlying reasoning behind lexical studies is that aspects of individual differences are communicated about, thereby becoming part of everyday language, and are thus ultimately included in dictionaries. In lexical studies, researchers present lists of personality-descriptive words (typically adjectives) drawn from dictionaries to participants who rate the extent to which they (or close acquaintances) possess these attributes. Data from large samples are then (factor) analyzed, resulting in a relatively small set of mostly unrelated factors that summarize a wide range of individual differences.

In recent years, findings from lexical studies across more than 10 languages – including Croatian, Dutch, English, Filipino, French, German, Greek, Hungarian, Italian, Korean, Polish, and Turkish – have suggested that personality might best be described by six factors (e.g., Lee and Ashton, 2008), resulting in the HEXACO Model of Personality. Honesty-Humility is one of these six factors alongside Emotionality, eXtraversion, Agreeableness, Conscientiousness, and Openness to experience. Note that findings from earlier lexical studies have often been considered support for the Five-Factor Model of Personality, and the remaining five factors of the HEXACO model are similar to these in content. At closer inspection, however, some of these earlier studies described a factor that can be interpreted as Honesty-Humility, though it was typically not considered a fully-fledged factor in its own right (for an overview, see Ashton and Lee, 2001). Also, early (English) lexical studies, which served as the primary basis for the original Five-Factor Model, were typically limited in terms of how many items (adjectives) could be considered, thus providing less precise factor solutions (cf e.g., Lee and Ashton, 2008).

Importantly, lexical studies merely provide a condensed descriptive simplification and grouping of personality-descriptive adjectives. As such, they do not inherently yield a theoretical account of basic personality. However, beyond the mere lexical findings, the HEXACO model (Ashton and Lee, 2007; Ashton et al., 2014) does encompass theoretical reasoning for why and how its six dimensions make up the core dimensions of personality. More precisely, drawing connections to evolutionary biology, Honesty-Humility, Agreeableness, and Emotionality are suggested to represent aspects of altruism, namely active reciprocal altruism (Honesty-Humility), reactive reciprocal altruism (Agreeableness), and kin altruism (Emotionality). The three other factors, in turn, are taken to represent engagement or endeavor with regard to socially related (Extraversion), task-related (Conscientiousness), and idea-related (Openness to experience) areas.

Correspondingly, Honesty-Humility reflects a blend of characteristics, which contribute to (long-term) mutual cooperation as opposed to actively exploiting others. In this vein, Lee and Ashton (2004) operationalized Honesty-Humility as comprising the facets of Sincerity ("a tendency to be genuine in interpersonal relations"), Fairness ("a tendency to avoid fraud and corruption"), Greed Avoidance ("a tendency to be

uninterested in possessing lavish wealth, luxury goods, and signs of high social status"), and Modesty ("a tendency to be modest and unassuming," all p. 334). Unlike Agreeableness (comprising the facets Forgivingness, Gentleness, Flexibility, and Patience), Honesty-Humility refers to how people typically behave when they can actively shape cooperation (nonexploitation). Agreeableness, on the other hand, refers to how people react to (perceived) exploitation, that is, their tendency to forgive or retaliate.

Summarizing thus far, Honesty-Humility has been recovered as a basic dimension in several lexical studies across different languages, linked theoretically to established concepts from evolutionary biology, and proposed to play an important role for various social criteria – especially in the realm of behaviors reflecting active cooperation. Next, we provide an overview of research testing these conjectures, i.e., (1) that Honesty-Humility represents a core personality factor, and (2) that it accounts for cooperation in terms of active reciprocal altruism.

A Basic Personality Dimension Explaining Active Cooperation?

The claim that Honesty-Humility represents a core personality dimension has been examined in several investigations. In particular, its relation to established personality attributes – especially those typically thought to lie outside of the range captured by the Big Five – has been examined. For instance, Honesty-Humility has been consistently associated with constructs of the 'Dark Triad,' i.e., Machiavellianism (a personality construct capturing attributes such as being deceitful, ruthless, and self-centered), narcissism (a personality construct capturing attributes such as grandiosity, entitlement, and feeling superior to others), and psychopathy (a personality construct capturing attributes such as having a lack of empathy, a parasitic lifestyle, or high impulsivity). Quite irrespective of whether self- and/or observer-reports are relied on, correlations between Honesty-Humility and the Dark Triad constructs are typically between $r \approx -0.40$ and $r \approx -0.70$, and Honesty-Humility has been found to explain unique variance in the prediction of the Dark Triad constructs beyond the Big Five (Lee and Ashton, 2014; Lee et al., 2013). A similar pattern has emerged for relations between Honesty-Humility and other traits that are not fully accounted for within the Big Five space, for instance attributes of Paunonen's Supernumerary Personality Inventory (Lee et al., 2005) or egoism (De Vries et al., 2009). So, Honesty-Humility has been found to broadly and uniquely cover several aspects of the personality space, thus confirming the implication of lexical findings that it represents a basic dimension of personality.

Concerning the core theoretical notion that Honesty-Humility essentially relates to active reciprocal altruism, a series of critical tests can be highlighted. Specifically, Honesty-Humility was shown to predict dictator game giving (e.g., Hilbig and Zettler, 2009), contributions to public goods (Hilbig et al., 2012), choice of the cooperative option in prisoner dilemmas (Zettler et al., 2013), and the willingness to maximize joint outcomes (at some personal cost) in the framework of social value orientations (e.g., Hilbig et al., 2014). As such, Honesty-Humility predicted both self-reported and actual active cooperation, typically yielding small- to medium-sized effects. Also, Honesty-Humility repeatedly accounted for incremental variance beyond the other basic factors (either in terms of the Five Factor or the HEXACO model) and was by far the strongest – and in several cases the only – predictor. In addition, recent investigations (e.g., Hilbig et al., 2013a) tested the theoretical distinction between Honesty-Humility (active cooperation) and Agreeableness (reactive cooperation) according to the HEXACO model, and found empirical support for the dissociation of these factors.

Honesty-Humility and Life Outcomes

Although Honesty-Humility was introduced relatively recently, it has been investigated with increasing frequency – spanning broad areas of interest. Herein, we will roughly sketch the most dominant of these research streams, namely sex-, money-, and power-related variables, deviant behavior and crime, as well as sociopolitical attitudes.

Based directly on links between Honesty-Humility and Machiavellianism, narcissism, and exploitativeness, Honesty-Humility has also been found to be negatively associated with selfish tendencies in a broader sense. For instance, a study by Lee et al. (2013; for similar results, see e.g., Ashton and Lee, 2008b) found that people low in Honesty-Humility showed more selfish tendencies concerning sex, money, and power. More precisely, across self- and peer-reports, Honesty-Humility was negatively related to a sex-related measure encompassing short-term mating orientation and behavior, a ludus love style, and the tendency for sexual quid pro quo. Also, Honesty-Humility accounted for a money-related measure capturing conspicuous consumption and materialism as well as for a power-related measure comprising a desire for power and social dominance orientation (i.e., the tendency to endorse social hierarchy and inequality). In the analyses, Honesty-Humility was typically the strongest predictor as compared to the other five factors of the HEXACO model, to the Big Five measured via corresponding inventories, or to composite measures of the Dark Triad constructs. Thus, extending the findings outlined above, Honesty-Humility appears to impact a broader set of selfish, egoistic, or self-centered tendencies and behaviors that are of societal interest.

Another fruitful research stream has linked Honesty-Humility to counterproductive activities, deviant behavior, and crime. Since low Honesty-Humility entails one's pull toward prestige, high social status, or luxury goods, a link between this trait and individuals' willingness to engage in criminal or deviant behavior (in order to reach these aims) is typically expected. Correspondingly, across different countries and across a variety of samples including students, employees, and community samples, individuals high in Honesty-Humility have been found to show less deviant or crime-related behavior subsuming fraud, theft, vandalism, alcohol, drug consumption etc. Results typically indicate medium to strong effects of Honesty-Humility, outperforming all remaining core dimensions of personality (e.g., Ashton and Lee, 2008a; Dunlop et al., 2012; Zettler and Hilbig, 2010). In a similar vein, Honesty-Humility often added incremental variance beyond variables such as self-control or integrity test scores, which have been

considered among the most important predictors of deviance-related criteria. It must be noted, however, that this line of research is consistently limited by a lack of actual behavior as the criterion and a strong reliance on *reported* behavior. Overcoming this limitation seems necessary before a final judgment on the influence of Honesty-Humility for crime-related behavior can be made, although the extant evidence is entirely theory-consistent.

Furthermore, a growing line of research has linked Honesty-Humility to social, ecological, economic, or political attitudes and behavior. For instance, Honesty-Humility has been found to be positively associated with proenvironmental attitudes and ecologically responsible behavior (Hilbig et al., 2013b). This is compatible with the notion that solving ecological issues typically requires cooperative action from an individual or group (e.g., the 2°C climate target, i.e., reducing carbon dioxide emissions to a level limiting global warming to 2°C) and/or forgoing personal luxury (e.g., refraining from heavy air conditioning). Concerning politics, Honesty-Humility has been repeatedly associated with low social dominance orientation (see above) and (in some countries) a more left-wing political orientation and corresponding voting behavior (e.g., Chirumbolo and Leone, 2010). The conceptual link at this point is arguably an unconditional cooperative orientation, also implying a preference for social equality. Relatedly, Pozzebon and Ashton (2009) found that Honesty-Humility was linked to values and corresponding behavior concerning benevolence (positively), hedonism (negatively), and power (negatively), and Lee et al. (2009) demonstrated that Honesty-Humility is the basic personality factor most strongly related to one of the two central dimensions of personal values, namely self-transcendence versus self-enhancement (whereas the other core personal value, Openness to change vs Conservation, is most strongly associated with Openness to experience). Besides such direct relations, the notion that Honesty-Humility relates to a central dimension of personal values is further supported by the finding that people overestimate the similarity between themselves and close acquaintances particularly in terms of Honesty-Humility and Openness to experience, but not on other basic factors. This could be taken to imply that people emphasize similarity in characteristics associated with Honesty-Humility and Openness to experience as these most strongly correspond to important values for one's identity (Lee et al., 2009). Overall, alongside Openness to experience, Honesty-Humility has been established as the basic personality factor associated most strongly with ecological, political, and morality-related values, attitudes, and behavior.

Beyond the research summarized herein, other investigations have successfully linked Honesty-Humility to a broad range of variables in the realm of personality disorder traits (e.g., Antagonism), risk taking and sensation seeking (e.g., ethical risk taking), religiousness, creativity, and other domains – a continuously updated list of published articles concerning the HEXACO model in general and Honesty-Humility in particular can be found at www.hexaco.org.

Interaction with Situations

Beyond such 'main effects' of Honesty-Humility on the Dark Triad constructs, crime, sociopolitical attitudes etc., several studies have also attempted to place Honesty-Humility into the broader framework of person–situation interaction. Indeed, apart from general notions contending that behavior will always result from an interplay between person and situation factors, the definition of Honesty-Humility itself explicitly entails a corresponding prediction: Ashton and Lee (2007) described Honesty-Humility as the tendency for fairness and cooperation "*even when* one might exploit [others] without suffering retaliation" (p. 156, emphasis added). In other words, people high in Honesty-Humility are expected to show cooperative behavior irrespective of whether or not the situation would allow them to exploit others. Those low in Honesty-Humility, by contrast, should, by implication, exploit others if and only if this is possible without running the risk of retaliation or other negative consequences. As a core methodological strength, Honesty-Humility is thus defined in a way that allows for experimental tests.

In one early straightforward test of the hypothesized person–situation interaction, Hilbig and Zettler (2009) asked participants to allocate goods (100 points) between themselves and another person in both the dictator and the ultimatum game. Importantly, in the dictator game the other person has no power over the offer, that is, she or he has to accept it (even if the 'offer' is zero, i.e., the dictator keeps everything). In the ultimatum game, on the other hand, the other person may reject the offer in which case neither of the participants receives any payoff at all. So, in the latter case, attempted exploitation (by the allocator) may be met with retaliation (by the recipient). Hilbig and Zettler (2009) found an interaction between Honesty-Humility and this situational manipulation (dictator vs ultimatum game) in line with the definition of Honesty-Humility: Those high in Honesty-Humility allocated a fair amount of goods to the recipient in both conditions, whereas those low in Honesty-Humility were selfish in the dictator game (in which they did not need to fear retaliation), but shifted toward a fair offer in the ultimatum game.

A similar pattern of interaction has been found with regard to two social dilemmas, namely, public goods and prisoner's dilemma. Concerning the public goods dilemma, Hilbig et al. (2012) manipulated the anonymity and presence versus absence of potential punishment for free-riding, and found that those high in Honesty-Humility, once again, contributed substantially to the pubic goods quite irrespective of this manipulation. Those low in Honesty-Humility, in turn, increased their contributions strategically only if potential punishment for free-riding was introduced. In the prisoner's dilemma, Zettler et al. (2013) manipulated the potential benefits (and risks) of choosing the noncooperative option. Again, it was found that those high in Honesty-Humility chose the cooperative option relatively irrespective of how attractive (and nonrisky) defection was, whereas those low in Honesty-Humility conditioned their decision on such incentives for defection (cooperating if and only if defection was not very tempting and rather risky).

Importantly, this interaction pattern has also been found in an applied setting. In a field study with employees, Zettler and Hilbig (2010) investigated whether Honesty-Humility interacted with the situational factor of organizational politics (in simple terms, whether the work environment is characterized by self-serving activities) in bringing about counterproductive work behavior. Indeed, the results suggested a similar pattern: Those high in Honesty-Humility showed relatively little

counterproductive work behavior, again quite irrespective of the level of organizational politics in their workplace. Those low in Honesty-Humility also refrained from counterproductive work behavior whenever the level of organizational politics was low, and, in turn, when the (subjective) probability for being sanctioned for self-serving behavior was rather high; however, under high levels of organizational politics they showed substantially more counterproductive work behavior.

Methodological Issues

The most widely used measures to assess Honesty-Humility are the corresponding scales from the different versions of the HEXACO Personality Inventory-Revised (HEXACO-PI-R, Ashton and Lee, 2009; Lee and Ashton, 2004, 2006). More precisely, three versions of the HEXACO-PI-R exist, namely one version (HEXACO-60) assessing Honesty-Humility with 10 items, one version (HEXACO-100) assessing Honesty-Humility with 16 items, and one version (HEXACO-200) assessing Honesty-Humility with 32 items. The HEXACO-PI-R is available in different languages as a self- and, in several cases, an observer-report form – including Chinese, Croatian, Dutch, English, French, German, Hungarian, Italian, Japanese, Korean, Lithuanian, Polish, Romanian, Serbian, Spanish, and Turkish. Sample items for Honesty-Humility are "I wouldn't pretend to like someone just to get that person to do favors for me" (belonging to the sincerity facet), "I would never accept a bribe, even if it were very large" (belonging to the fairness facet), "Having a lot of money is not especially important to me" (belonging to the greed avoidance facet), or "I am an ordinary person who is no better than others" (belonging to the modesty facet).

Although all three versions have been found to yield good psychometric properties in general, they entail the usual trade-off between precision on the facet level and brevity. Specifically, in the HEXACO-60, each facet is represented by two or three items only. Therefore, facet scores will typically not yield satisfactory reliability. In the HEXACO-100, each facet is represented by four items, resulting in the possibility to obtain facet scores with acceptable reliability (the internal consistency estimates typically are between $\alpha \approx 0.60$ and $\alpha \approx 0.85$). In the HEXACO-200, finally, each facet is represented by eight items providing relatively robust facet-level information (internal consistency estimates typically are between $\alpha \approx 0.75$ and $\alpha \approx 0.90$).

Besides the HEXACO-PI-R, other measures assessing Honesty-Humility (or essentially identical constructs) have also been introduced, including the Questionnaire Big Six Scales (QB6; Thalmayer et al., 2011), scales derived from the International Personality Item Pool (IPIP; Ashton et al., 2007), or a relatively brief measure (consisting of 24 items) of the HEXACO factors (Brief HEXACO Inventory, BHI, De Vries, 2013). These notwithstanding, most research concerning Honesty-Humility has been conducted with versions of the HEXACO-PI-R. On the one hand, this fact facilitates comparisons between research findings and fosters general conclusions about the validity of Honesty-Humility as represented by the HEXACO-PI-R (which arguably is most directly tied with the HEXACO model). On the other hand, it could also be considered a drawback because findings might be limited to some unknown specifics of the HEXACO-PI-R. So, future research might profit from an increased use of alternative questionnaires assessing Honesty-Humility.

Also, the currently available measures are constructed for adults in particular, both in terms of wording and/or the context referred to (e.g., bribes, taxes, or the work life). As such, none allow for assessing the six HEXACO factors of (younger) children. Thus, results on the importance of Honesty-Humility are limited to adults, so far, and it could be a fruitful future direction to extend this knowledge to children and adolescents. In addition, there is a continued need for evidence based on methods other than questionnaires, e.g., direct observation of behavior, implicit attitude measures, or physiological variables to provide a broader understanding of Honesty-Humility and its nature and consequences.

A crucial aspect in the assessment of Honesty-Humility is its relation to response biases such as socially desirable responding. Indeed, given that Honesty-Humility encompasses attributes such as being sincere, honest, and loyal versus deceitful, boastful, and hypocritical (Ashton and Lee, 2008a; Lee and Ashton, 2004, 2006), Honesty-Humility can be considered a socially desirable characteristic in itself. So, one might argue that individuals scoring high in Honesty-Humility are not actually more sincere, honest, or the like but rather exhibit a stronger tendency to claim possessing such attributes – at least, when self-reports of Honesty-Humility are used. Although research on the link between Honesty-Humility and socially desirable responding is limited, so far, some conclusions can be pointed out: First off, an increasing number of findings has suggested that self- and observer-reports of Honesty-Humility are typically correlated just as strongly as self- and observer-reports of other traits, namely between $r \approx 0.50$ and $r \approx 0.60$ (e.g., Dunlop et al., 2012; Lee and Ashton, 2006). This hints that Honesty-Humility is, at best, as much affected by socially desirable responding as the other basic factors. Perhaps more importantly, a positive link between Honesty-Humility and truthful responding has been found based on observation of actual behavior (Hershfield et al., 2012). This could not be the case if (many) individuals actually low in Honesty-Humility strongly biased their answers upward and thus scored high on the scale. Likewise, this could not be the case if (many) individuals actually high in Honesty-Humility biased their answers downward due to their modesty. Similarly, those low in self-reported Honesty-Humility have been shown to be more likely to commit moral transgressions but concurrently less likely to be upfront about their wrongdoings as compared to those high in Honesty-Humility (Hilbig et al., in press). So, overall, it seems justified to conclude that (self-)reports of Honesty-Humility are valid and no more strongly affected by socially desirable responding than other factors. Nonetheless, still more fine-grained research aiming to tease apart Honesty-Humility and socially desirable responding is needed to ultimately test concerns about biases when assessing Honesty-Humility.

Future Directions

In light of the fact that Honesty-Humility has been established rather recently as a core personality dimension, it is unsurprising

that several issues will require additional attention in the next years. Here, we will suggest some potential future issues for the Honesty-Humility factor – clearly inspired by already existing preliminary hints or by corresponding research concerning other personality traits.

From an overarching perspective, research on Honesty-Humility could play a more important part in other disciplines, both within psychology and, more generally, in the social sciences. So far, most studies have been conducted through the lens of personality psychology and, though to lesser degree, with regard to ethical decisions and behavior, sociopolitical attitudes and behavior, and social-dilemma decision-making. By comparison, the Big Five are still the prime model of basic personality structure in other fields such as educational psychology, sport psychology, and clinical psychology. Nonetheless, the definition of Honesty-Humility and some of the extant empirical toe-holds indicate that this construct might also be crucial for important aspects within these fields. For instance, Honesty-Humility could predict bullying, long-term team success, or the success of interventions aiming to reduce aggressive or exploitative behavior. Thus, it seems a fruitful agenda to consider Honesty-Humility more thoroughly in other fields of psychology and beyond.

Other important aspects which are, as yet, clearly under-investigated concern the biological basis and development of Honesty-Humility. That is, the role of genetics (heredity) versus environmental influences (e.g., upbringing) for Honesty-Humility has not yet been investigated. On a related matter, the question of change over time and, if observable, its direction remains to be addressed. One might speculate, for instance, whether Honesty-Humility increases with age or whether particular contexts (e.g., one's social and/or work environment) actually influence individuals' levels of Honesty-Humility. Furthermore, research on (zero-acquaintance) personality judgments concerning Honesty-Humility is largely missing, that is, whether an individual's level in Honesty-Humility can, to some extent, be correctly inferred by strangers (as is the case for Extraversion, to name an example). Findings concerning these issues (i.e., genetics, development, and personality judgment) might further complement the existing notions on the evolutionary basis of the HEXACO model. From a methodological point of view, corresponding research would also imply a stronger reliance on different paradigms, study designs, and/or assessment methods (e.g., longitudinal investigations, twin and adoption studies).

Conclusions

Recently, Honesty-Humility has been recovered as a basic dimension of personality and research on this construct has been impressively fruitful. There is consistent support that Honesty-Humility reflects a core dimension of personality, that it uniquely predicts a broad range of behaviors which represent active cooperation, that it is related to criteria somewhat outside of the Big Five space, to deviant behavior, and/or to sociopolitical attitudes, and that it entails a specific pattern of person–situation interactions as implied by the HEXACO Model of Personality. These extant findings notwithstanding, further investigations will be needed to establish more comprehensive knowledge on Honesty-Humility. Given the indisputable importance of Honesty-Humility for many aspects of broad societal relevance, a still deeper understanding of its determinants and development, its interplay with contextual factors, and its consequences may contribute to facing future challenges inherent in human interaction between individuals, dyads, groups, societies, and even cultures.

Acknowledgment

Abstract

Axel Honneth is the leading light of the current, third generation of critical theorists. He has sought to refound a critical theory of society on a revivified version of Hegel's idealist philosophy, and, in particular, on the idea of recognition that he believes lies at its heart. According to Honneth's theory, there are three types of institutions – the family, law, and the market – in which three distinctive forms of recognition – love, respect, and esteem – may be experienced. For him, social justice is achieved to the extent to which all individuals have an opportunity to receive these various types of recognition in practice.

Honneth's Output, Academic, and Intellectual Achievements

Overview of Honneth's Output

Honneth is the author of a number of monographs, cowritten volumes, and collections of essays in a number of areas of critical theory, social philosophy, and the theory of recognition. Of his extensive oeuvre, the two most important works are the monographs *The Struggle for Recognition* (1995b) and *Freedom's Right* (2014). He has also written a number of shorter books, including *Reification* (2008) and *The Pathologies of Individual Freedom* (2010). In addition, Honneth has coauthored two volumes: *Social Action and Human Nature* (1988) with Han Joas, and *Redistribution or Recognition?* (2003) with Nancy Fraser. Several collections of his articles and essays have also been published, including *Disrespect* (2007) and *The I in We* (2012).

Honneth's first published book, cowritten with Hans Joas, was *Social Action and Human Nature* (1988; first published in German in 1980). Departing from Marxism, and discussing a range of contemporary thinkers including Nobert Elias, Michel Foucault, and Jürgen Habermas, this volume presents an argument for a 'philosophical anthropology' and for what Honneth and Joas call a 'historical anthropology.' These are regarded as two theoretical standpoints which seek to understand human nature as intersubjectivist in nature, displaying historical variations, but retaining a fixed core.

The Critique of Power (1991) and *The Fragmented World of the Social* (1995a) gather together essays, most of which were first published between 1982 and 1992, just prior to the publication of *The Struggle for Recognition*. In the first of these volumes, Honneth investigates the idea of a critical theory, and considers what form it might take in the contemporary world. He starts from Max Horkheimer's version of critical theory, but ends up examining the work of a number of contemporary theorists, including Foucault but above all Habermas. In the second of these volumes, Honneth again reflects on the nature of critical theory. In this book, he looks with increasing interest at potential French resources for such a theory. This time, his attention is directed not just to Foucault, but to Jean-Paul Sartre, Pierre Bourdieu, and others too. In these essays, it is possible to see the emergence of a number of themes that are of great importance to Honneth in his later work, including an attempt to refound critical theory in light of contemporary intellectual and social developments, and also the further development of an intersubjective account of human identity. Having said this, the theory of recognition with which Honneth is now strongly associated did not emerge clearly until the publication of *The Struggle for Recognition*.

First published in German as *Kampf um Anerkennung* in 1992, Honneth's *The Struggle for Recognition* (1995b) is the first key work in his oeuvre. Most of his writings over the 20 or so years since it was first published elaborate, defend, revise, and extend the theoretical framework articulated there. While it is true that the ideas which feed into Honneth's account of recognition can be seen in some of his earliest essays, the idea of a struggle for recognition as the leitmotif of his work seems to have emerged around 1990. In that year, he was awarded his Habilitation entitled '*Kampf um Anerkennung*,' and he published an important article 'Integrity and Respect: Principles of a Conception of Morality Based on the Theory of Recognition' (1992), which was initially given as a lecture in 1990. The theoretical framework which Honneth articulates in *The Struggle for Recognition* is discussed in more detail below.

In *Redistribution or Recognition? A Political-Philosophical Exchange* (2003), Honneth engages in an important debate with Nancy Fraser about the politics of recognition. In this exchange, both restate their own accounts of recognition, and both seek to refute each other's objections to their accounts. This book is important for understanding the scale of Honneth's ambition in claiming that all forms of injustice can be understood as types of misrecognition. He also seeks to show that his recognition-based theory of justice is not a form of ethical perfectionism, and nor it is one of deontological proceduralism. This part of his argument can be read as an extension of the idea of a 'formal conception of ethical life,' which he introduced in his *The Struggle for Recognition*.

Disrespect (2007) and *The I in We* (2012) are two collections of essays in which Honneth continues to finesse his theory of recognition. Most of the essays in the first of these collections were originally published from 1994 to 2000. The second collection brings together essays written between about 2004 and 2010. This latter book is divided into four sections, which, it could be argued, correspond to the major building blocks of Honneth's work: an interpretation of G.W.F. Hegel's philosophy of intersubjectivity, a defense of the idea of recognition as the foundation of a theory of social justice, an account of the 'paradoxical' developments of capitalism, and a distinctive

interpretation of object-relations psychoanalysis. *Pathologies of Reason* (2009) brings together essays first published between 2003 and 2007 on the German tradition of critical theory, including discussions and analyses of Theodor Adorno, Walter Benjamin, Sigmund Freud, Franz Neumann, and others.

Reification: A New Look at an Old Idea (2008) and *The Pathologies of Individual Freedom* (2010) are two relatively short books marking further developments of important aspects of Honneth's thought. The first of these volumes reprints the Tanner Lectures on Human Values, which Honneth delivered at the University of California, Berkeley in 2005. In these lectures, he seeks to revivify György Lukács' idea of reification by placing it in the framework of his theory of recognition. As a result, Honneth stretches the idea of recognition downward, as it were, below the level of reflexive ethical life to that of humans' most elementary and practical relationship to the world around them. *The Pathologies of Individual Freedom* is a short book – or a long essay – on the account of ethical life which Hegel presented in *The Philosophy of Right*. Against his earlier view, defended in *The Struggle for Recognition*, Honneth acknowledges here that an intersubjective account of recognition remains a key element in Hegel's thought from the early Jena writings of 1802–06 to the mature *Philosophy of Right* of 1821.

It is likely that *Freedom's Right* (2014) will mark a major development in Honneth's intellectual evolution. In this lengthy monograph, he presents a careful and detailed analysis of the ways in which freedom is grounded in the institutions of modern society. Continuing his earlier concerns, *Freedom's Right* draws on and reinterprets Hegel's idea of ethical life, especially as this is presented in *The Philosophy of Right*. This monograph also sees Honneth thinking more systematically about the democratic public sphere and the democratic state than he has done before. Since it was only published in English in 2014, it is impossible to know as yet what impact *Freedom's Right* will have on the various fields – including critical theory, social philosophy, theories of recognition, and so on – in which Honneth is influential. However, given his current importance, and the weightiness of this volume, it would seem safe to predict that its impact will be wide-ranging and profound.

Honneth's Academic and Intellectual Achievements

Critical Theory

Honneth regards himself first and foremost as a critical theorist in the tradition that began with the founding of the Institute for Social Research – or Frankfurt School – in 1923. He has considered the idea of critical theory on a number of occasions, seeking to determine what such a theory could and should look like today (see especially Honneth, 2009). Committed to the cause of human liberation or emancipation, critical theorists seek to show how particular social formations can act as obstacles to such liberation, and they do so by formulating their critiques in terms that are drawn from an account of those social formations themselves. To put this another way, critical theorists believe that there are resources in the present, identified by their critiques, out of which a better, more emancipated future can be created. It is this particular concatenation of beliefs, which gives critical theory what Fraser describes as "its distinctive dialectic of immanence and transcendence" (Fraser and Honneth, 2003: 202).

The dominant figures in the first generation of critical theorists were Adorno and Horkheimer. In their early work, these thinkers remained to some degree loyal to the Marxian belief that the proletarian class could and would act as the historical agent of human liberation. Later on, following a growing awareness about the nature of actually existing communism, Adorno in particular offered a much more pessimistic account of the prospects for human emancipation. In the second generation of critical theorists, Habermas is the figure who stands above all others. He sought to find a new way of justifying at least a cautious optimism about the possibility of a more emancipated future. He did so by developing a theory of 'communicative rationality,' which seeks to root universally valid moral claims in structures of human communication. Honneth, the leading light of the current, third generation of critical theorists, has sought to refound a critical theory of society on a revivified version of Hegel's idealist philosophy, and, in particular, on the idea of recognition which he believes lies at its heart.

Hegelian Roots

It follows from this that it is of vital importance to understand Honneth's relationship to Hegel. The closeness and intensity of this relationship started to become clear as Honneth's theory of recognition began to emerge around 1990. In *The Struggle for Recognition*, Honneth explicitly acknowledged his debate to Hegel (Honneth, 1995b: part I). At this stage, however, he concentrated on Hegel's Jena writings of 1802–06 rather than his later, better known work. Honneth did so because he was convinced that, with the publication of the *Phenomenology of Spirit* of 1806, Hegel had abandoned his insight into the central role of recognition in the intersubjective formation of human identity and social relations, and had replaced it with a transcendental philosophy at the heart of which lay the supra-individual entity of *Geist* (Honneth, 2007: 132–133). More recently, however, Honneth has changed his mind. Partly as a result of recent Hegel scholarship (e.g., Neuhouser, 2000), he now sees recognition as a central motif both of Hegel's *Phenomenology* of 1806 and of his *Philosophy of Right* of 1821 (Honneth, 2012: part I).

This reevaluation sees Honneth underline the significance of his debt to Hegel. In recent work, he has sought on several occasions to rework and resuscitate in particular Hegel's idea of ethical life (*Sittlichkeit*), and the idea of actualized freedom which stands at its core (see especially Honneth, 2010). For Hegel, ethical life is the system of customs and mores in which all individuals are embedded, and that shapes the ways in which they relate to one another. Ethical life has three principal parts. The family is the most elementary form of human sociality, governed by sentiment and feeling. Civil society is the realm in which individuals relate to one another as bearers of rights with whom they may chose to enter contractual relations. In the state, individuals regard themselves as part of a community (as they did unreflexively in the family), but they do so without losing the subjective freedom which they enjoy in civil society. Overall, the aim of Hegel's account of ethical life is to identify and specify the several sorts of material conditions which are jointly necessary to enable the

development of self-consciousness or the actualization of freedom. It will now be shown how, in Honneth's hands, these three aspects of ethical life are transmogrified into the three types of institutions in modern society – the family, law, and the market – in which three distinctive forms of recognition – love, respect, and esteem – may be experienced.

Idea of Recognition

To begin with, it is necessary to look more closely at Honneth's idea of recognition, and in particular to examine the various roles that it plays in his theoretical system. To identify several of the more important of these roles, recognition explains formation of individual identities, underlies the dynamics of social and political struggles, serves as the measure of social and ethical progress, and operates as a metric for social justice. In order to understand how it can do all this, it is important to understand that Honneth regards recognition as a relationship between two (or more) parties in which one positively acknowledges or affirms another (Honneth, 2012: 80). The first relationships of recognition are those between infants and their caretakers, but then they expand into ever wider circles of significant and then generalized others. In practice, of course, such positive acknowledgment cannot be guaranteed. From this perspective, Honneth suggests, struggles for recognition can be seen as collective attempts to move a society closer to one in which the right sort of relationships of recognition obtain, in which all individuals have roughly equal opportunities to achieve self-realization, and in which therefore social justice is achieved.

So far, reference has been made to the idea of recognition, and to relationships of recognition, *simpliciter*. But it is important to understand that for Honneth, recognition is a single genus with three distinct species (Ikäheimo, 2002), which he describes as love, respect, and esteem. These are all forms of positive acknowledgment, but each has its own internal logic and its own institutional location, which Honneth refers to as the family, the legal system, and the market, respectively. It is now necessary to consider each of these three modes of recognition in turn.

In his account of love, Honneth updates and reworks Hegel's account of the family. He does so by drawing on a form of object-relations psychoanalysis, that associated above all with the English psychoanalyst D.W. Winnicott (Honneth, 1995b: 95–107; 2012: part IV). From Winnicott and others, Honneth gets an account of the way in which the individual's identity is forged in the intense relationship between newborn infant and primary caretaker. Drawing on this psychoanalytical theory, Honneth seeks to 'de-transcendentalize' Hegel's account of the family, and to place it instead on a solid empirical footing. Seen from this psychoanalytical perspective, Honneth regards love as the "affectionate attention of concrete others" (1995b: 87). To be more specific, it is a relationship in which one person attunes themselves to another, and is in particular responsive to that other's needs. From the recipient's perspective, the experience of love enables them to acquire the confidence to articulate their needs with self-confidence and without shame (Honneth, 2003: 139). For Honneth, this mode of recognition is particularly significant since it is developmentally prior to respect and esteem. In other words, an individual must first experience love before they can experience either of the two other modes of recognition (Honneth, 1995b: 107, 176).

On Honneth's account, as we have just seen, love is initially and primarily experienced in the family. The individual's first experience of recognition is the love they receive (all being well) from their primary caretakers. Such recognition is then experienced in gradually widening circles of significant others, from siblings and other family members, to friends and other carers, and so on. Having said this, it is important to emphasize that, for Honneth, this expansion has strict limits. Love, in this specific sense at least, is limited to circles of significant others, and cannot be shown, for instance, to all of humanity or all of creation: it is "constituted by strong emotional attachments among a small number of people" (Honneth, 1995b: 95). It is worth noting, finally, that in more recent work Honneth concedes that the family is not a sphere purified of all forms of relationship except that of love. Instead he describes a 'tension' between affection and justice in which family members are united by relationships of love, but must at the same time seek to determine the moral obligations which they have to one another (Honneth, 2007: Chapter 7). In this way, Honneth acknowledges that there is not an exclusive one-to-one relationship between particular modes of recognition and particular social institutions.

In addition to love, recognition also takes the form of respect or what Honneth sometimes calls "legal recognition" (e.g., Honneth, 2003: 170). This mode of recognition is not precisely correlated with a single aspect of Hegel's ethical life. In one sense, respect is the sort of attitude that individuals in civil society take to one another when they regard each other as possessors of subjective rights. This mode of recognition is also related to Hegel's account of the state, in which individuals come to understand themselves as equal citizens subject to the authority of the same legal order. In Honneth's case, respect is regarded as a relationship in which one person acknowledges another's capacity for rational autonomy, and thus acknowledges their right to be in charge of their own life. In more recent work, Honneth has fleshed out this conception of respect a little further. Following Kant, he suggests that the person who respects another 'thwarts' their own 'self-love' in order to give due weight to the interests of that other (Honneth, 2012: 85; quoting Kant, 1785: 17–18). To respect another, that is to say, is to negate one's desires or to limit one's egoistic actions in order to take appropriate cognizance of or to take up an appropriate attitude to that other.

In practice, Honneth suggests, people treat each other respectfully by regarding each other as bearers of rights guaranteed to them by their state. For instance, when a person does not try to prevent another from speaking freely, they acknowledge the other's right to freedom of expression, and thus they respect them as a person who is capable of the responsible exercise of their ability to express their own opinions and to hear the opinions of others. Thus the institutional framework in which this mode of recognition is located is the legal system, and in particular in the system of subjective rights, to be found in the modern state. This having been said, Honneth is of course well aware that contemporary doctrines of human rights suggest that, rather than being restricted to the legal systems of particular states, the scope of such rights is universal. According to these doctrines, he writes, "it is assumed

that human beings themselves are capable of granting the universal rights that guarantee a human life with dignity for all" (Honneth, 2007: 209). Again this suggests that there is not a wholly exclusive relationship between this mode of recognition and a particular type of social institution.

The third and final mode of recognition which Honneth identifies is esteem. Once more, the relationship between this type of recognition and Hegel's account of ethical life is not straightforward. Esteem, for Honneth, is a mode of recognition experienced by participants in the market. Thus it may appear to be closest to the sort of attitude which individuals take to one another in Hegel's civil society. For Hegel, however, individuals in civil society act selfishly in pursuit of their own interests, and, while they may regard each other as bearers of subjective rights, they only contract with one another in order to advance their interests. For Honneth, by contrast, esteem is a relationship in which people do not merely receive their contractual dues, but are rather valued for their achievements or the contributions which they make to shared societal goals (Honneth, 1995b: 122). As he puts it, "in the system of market-mediated exchange, subjects mutually recognize each another as private autonomous beings who act for each other and thereby sustain their livelihood through the contribution their labour makes to society" (Honneth, 2012: 64).

According to Honneth, if these relationships of esteem are arranged as they should be, then esteem will be symmetrical, in the sense that "every individual is free from being collectively denigrated, so that one is given the chance to experience oneself to be recognized, in light of one's own accomplishments and abilities, as valuable to society" (Honneth, 1995b: 130). However, things rarely work out this well in practice. In 'developing capitalist' society, there was a 'one-sided, ideological valuing of certain achievements,' so that other sort of achievements – including those connected to 'household work' – were systematically undervalued (Honneth, 2003: 141). And, in the most recent 'neoliberal' phase of capitalist development, workers have been forced to become 'entreployees' who are expected to be self-motivated, flexible, and responsible for setting and achieving the work goals which they have set themselves (Honneth, 2012: 173–175). However, since the societal goals by which individuals' contributions are judged are subject to constant interpretation and reinterpretation, then, Honneth suggests, it is always possible for groups to struggle to be esteemed for achievements which were previously undervalued. The struggles of second-wave feminists to make women's housework and extradomestic labor suitably acknowledged and rewarded would be a good example of this phenomenon in practice.

Struggles for Recognition

These final remarks suggest that in practice relationships of recognition may be distorted, incomplete, or entirely absent. According to Honneth, the various sorts and degrees of misrecognition and nonrecognition thus experienced are regarded as profound injustices. From this perspective, struggles for recognition can be seen as attempts by groups of individuals to repair, restore, or create *de novo* relationships in which they receive appropriate acknowledgment. It is for this reason, to cite the subtitle of Honneth's *The Struggle for Recognition*, that the language of recognition provides "the moral grammar of social conflicts" (Honneth, 1995b). In other words, a wide range of social conflicts can be understood as struggles in which groups strive to obtain the acknowledgment from others which they believe is their due. In this way, Honneth naturalizes Hegel's famous account of the struggle for recognition between lord and bondsman in Chapter 4 of the *Phenomenology*. For Honneth, rather than regarding such struggles as necessary for the evolution of consciousness, they are instead seen as the motors of moral and social progress.

It is important to understand that, for Honneth, struggles over each mode of recognition unfold in their own way, since each contains its own distinctive developmental potential. This is least so in the case of love. Honneth has generally denied that this first mode of recognition can develop in the same way that both respect and esteem can. Having said this, in his contributions to Redistribution or Recognition?, he does hint that it may be possible for individuals to come to receive a more appropriate kind of love from their significant others. As he says, a "different or expanded kind of care" may be possible in which "newly developed or previously unconsidered needs" can be met (Honneth, 2003: 144). To a much greater degree, struggles for recognition can both widen the scope and deepen the content of respect and esteem. In both cases, recognition may develop along two distinct axes. So far as respect goes, struggles may result in more people being considered as eligible subjects for rights, and at the same time the content of those rights may become more extensive. T.H. Marshall's account of the evolution from civil through political to social rights is often cited in this regard (Marshall, 1950). In the case of esteem, there are once again two dimensions along which such recognition can develop: in the process of 'individualization,' unique individuals rather than social groups become the potential objects of esteem (Honneth, 1995b: 125), and, in the process of 'pluralization,' a stable hierarchy of esteem is gradually replaced by a 'horizontal competition' between values (Honneth, 1995b: 122).

It is important finally to understand that for Honneth the point of this analysis is not just to identify the characteristic lines along which struggles for respect and esteem may develop. It is also to show how such struggles lead to social and ethical progress, as society moves closer to a condition in which every one of its component parts receives appropriate acknowledgment. If the right sort of relationships of recognition are in place, then all individuals will have roughly equal opportunities to enjoy the acknowledgment which they need and deserve. The receipt of such recognition is a necessary condition of their having an opportunity to achieve self-realization, and it is for this reason that the justice of a particular regime of recognition is to be judged by its ability to put those conditions of recognition in place. As Honneth says: "The justice or well-being of a society is proportionate to its ability to secure conditions of mutual recognition under which personal identity-formation, hence individual self-realization, can proceed adequately" (Honneth, 2003: 174). Here we see clearly how the descriptive and prescriptive elements of Honneth's theory come together: recognition explains the formation of individual identity, and at the same time provides the metric for social justice.

How the Work Has Been Received and What Long-Term Impact It Will Have

How the Work Has Been Received

It has been suggested that Honneth is widely acknowledged to be the leading figure in the current, third generation of critical theorists. As Director of the Institute of Social Research since 2001, he has overseen a range of important and innovative research programmes, gathered together under the overall banner of 'Paradoxes of capitalist modernization' (http://www.ifs.uni-frankfurt.de/institut/). Honneth's influence is, however, not confined to Frankfurt narrowly or German-speaking world more widely, and his appointment to a chair at Columbia University in 2011 is one clear indication that his influence is now being felt worldwide. To put it in slightly passé terms, there is no doubt that Honneth's work transcends what used to be widely thought of as a divide between 'continental' and 'Anglo-American' philosophy. In a phrase, he is read not only by scholars of Hegel, but also by those of John Rawls, and there is no doubt it is his own profound understanding of both of these traditions which makes this possible. (See, for example, his essays on social justice (Honneth, 2012: Chapters 3, 7).)

It has also been suggested that Honneth's theory of recognition lies at the heart of his philosophical system. Hence it is not surprising that it is here that his influence has been at its strongest. Honneth is of course not the only important contemporary exponent of the theory of recognition. The continuing importance of Charles Taylor's seminal essay on 'The Politics of Recognition' cannot be overrated (Taylor, 1995). In addition, Fraser's strongly anti-Hegelian account of recognition (Fraser and Honneth, 2003) has served as an important challenge to Honneth's own Hegelian account. In addition, a number of other monographs on recognition have made significant contributions to the contemporary debate. Here Paul Ricoeur's *The Course of Recognition* (Ricoeur, 2005), in which he distinguishes between identification, self-recognition, and mutual recognition, deserves special mention. Finally, although it is not the principal focus of his work, it is arguable that James Tully's agonic conception of recognition (Tully, 2008) is another important rival to Honneth's Hegelian conception. All this having been said, there is no doubt that Honneth has set the agenda for contemporary debates about the philosophy and politics of recognition, and that all those wishing to write about this subject must write about him, if only to disagree.

There is, in addition, an extensive range of ways in which Honneth's theory of recognition has been applied in order to cast light on a wide variety of theoretical issues and practical problems. To give just one small example, in a volume on *The Politics of Misrecognition* (Thompson and Yar, 2011), contributors draw on Honneth's theoretical framework in order to discuss matters as diverse as racism, slavery, the unequal division of labor, disability, criminal harm, and leprosy. Beyond this one book, the list of topics to which Honneth's ideas have been applied could be extended much further to include the politics of identity and difference, multiculturalism, social movements, global justice, political economy, and so on.

What Long-Term Impact the Work Will Have

It is never easy to gauge the long-term impact of a particular thinker's work. Some drop suddenly out of intellectual fashion, while others enjoy unexpected revivals. This having been said, the steady and accelerating growth of interest in Honneth's work shows no sign of abating. Since his theoretical framework is constantly evolving, its continuing vitality would suggest that Honneth's existing readers will not stop reading him, and that many new ones will start. His theory of recognition, in particular, provides a highly flexible framework within which a wide variety of theoretical issues and practical problems can be usefully examined. The fact that it combines, among other things, an intersubjective account of the formation of individual identity, a framework for understanding the political struggles of social movements, an account of the nature of social justice, and a perspective from which capitalist labor relations can be evaluated, helps to explain why Honneth's influence is now widespread and profound, and why it will continue to be so for the foreseeable future.

Honor and Shame

Charles Stewart, University College London, London, UK

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Honor once defined northern Europeans, then it defined others on the margins of Europe, and now it is a problematic feature of others within Euro-American societies. This article traces honor and shame as paired concepts in social scientific thought beginning with their introduction by anthropologists of the Mediterranean in the 1960s. Men claimed honor through acts of bravado or violence that commanded social respect. Transgressions of a man's property, including his women, caused shame and required retaliation. Honor had been a familiar idea in medieval and early modern Europe, but it disappeared with the emergence of strong centralized states, and it became a fascinating anachronism in Mediterranean societies. Eventually it disappeared from the northern Mediterranean littoral only to resurface in the heart of modern Western societies among urban street gangs or in 'honor killings,' which have been on the rise in Europe and North America since the turn of the twenty-first century.

An historical perspective on honor and shame reveals this conceptual pair to be an othering label – a substandard ethos that Euro-American societies left behind with the advent of state judicial control. A strong whiff of what Fabian (1983) termed 'allochronism' hovers and makes contemporary honor and shame societies noncoeval with modern Western societies. The analysis of this situation in the first part of this article allows readers to understand what social scientists have understood by 'honor and shame' and where such social and cultural configurations could be found. This leads to a paradoxical observation. Whereas honor and shame had largely become extinct in Western societies by 1900, at the dawn of the twenty-first century they re-surfaced at the root of social panics over 'honor killings' in countries such as Sweden, Germany, and the USA. These acts of violence are interpreted as evidence of the unassimilated character of recent migrants from the Middle East and South Asia. 'Honor killings' drew upon a complex of ideas so foreign (or so anachronistic) that police and judicial systems in the West took quite some time to comprehend what was happening. Far from dying the death that seemed destined for them, globalization has returned honor and shame with new force. Social scientists must now consider how to understand and respond to honor and shame in a transnational situation where distant homelands can nourish these values and incite action in diasporas around the world.

Honor in Anthropology

Social anthropologists working in Mediterranean societies introduced the gender-linked concepts of honor and shame in the 1960s. Men claimed honor by staking out a reputation for aggressive machismo, while women submitted to their control with quiet modesty. Mediterraneanists treated honor and shame as a system of social values – very much in the Durkheimian tradition, as 'collective representations.' Honor comprised both an individual's sense of self-worth and this person's reputation in the surrounding community. Shame, by contrast, arose from the failure to act according to social values and it entailed public disgrace.

Anthropologists assumed that the honor and shame configuration was distinctively Mediterranean but its features can be found in many societies, especially in the Middle and Near East; from Morocco to India. The recognition of this wide dispersion, along with the demise of area studies, caused researchers to become more interested in local vocabularies and practices. Ethnographers ceased attempting to build a generalizable analytic model of honor and shame by the late 1980s. Historians of early modern Europe and America then became the social scientists most interested in investigating honor as an important social concept underpinning the social institution of dueling, for example. The concepts of honor and shame opened new insights for social and cultural historians wishing to explore the intimate topics of gender, sexuality, aggressive pride, self-regard, and public reputation.

By the middle of the twentieth century the word 'honor' was well on its way to obsolescence in ordinary English language usage. The practice of dueling to redress injuries to one's honor had ended and consequently honor had ceased to be a topic of public concern. The term was mainly frozen into stock expressions such as 'word of honor' or fixed in the aspic of formalized conventions, such as the Queen's Honors List, or the school honor roll. Honor was still a familiar word, yet people were not absolutely certain what it meant; it was rich in connotations, but poor in denotation.

The Oxford-trained anthropologist Julian Pitt-Rivers, scion of a venerable English family whose forebears may well have participated in the culture of honor in the nineteenth century, capitalized on the evocativeness of 'honor.' He reintroduced the word in a wide-ranging essay that drew principally on data from early modern European history. In that period honor drifted away from its medieval sense of a monarch's gift of fiefs in return for military services. By the seventeenth century it had come to mean a general social reputation and then in the early nineteenth century it took on a more interiorized sense of integrity or moral dignity. If publicly insulted – called a liar or cuckolded, for example – a man was within his rights to demand the satisfaction of a duel to restore his honor. Under

Napoleonic law a man could kill his wife with impunity if he caught her *in flagrante delicto*.

Pitt-Rivers used an amalgamation of the historical senses of honor to interrogate his own contemporary ethnographic data from a Spanish village. His essay appeared alongside studies of other Mediterranean societies in a book entitled *Honour and Shame: The Values of Mediterranean Society* (Peristiany, 1965) that launched honor and shame in anthropology. The premise of the volume was that "[M]editerranean peoples … are constantly called upon to use the concepts of honor and shame in order to assess their own conduct and that of their fellows" (Peristiany, 1965: p. 10).

For the most part honor and shame were conceived to be opposites and furthermore to orient different gender-linked ideals. Men were most likely to claim honor aggressively through acts of violence or cunning that earned them a fearsome reputation. This reputation was maintained by an ongoing performance of swagger and gruffness that staked out an inviolable space around a man's property, livestock, and women. As Peristiany noted (1965: p. 9), if provoked, "a Greek Cypriot, a Bedouin and a Berber may answer 'I also have a moustache'."

For their part, women protected this honor by comporting themselves with modesty. Among the Sarakatsani shepherds of northern Greece described by Campbell (1964: p. 287), women did not run for fear that they might fall over backwards and expose their underwear, thereby shaming themselves irretrievably. Ideally a young woman should stay at home working on her dowry, well away from the public gaze so that her name would not be on people's lips.

Comparative Considerations

The Mediterranean focus of the *Honour and Shame* volume spurred further ethnographic research within this 'culture area' and also attempts to theorize why such a similar set of values had been arrived at in this region. Virtually all anthropologists assumed that honor and shame were relatively consistent in form throughout the Mediterranean until Herzfeld (1980) pointed out, on the basis of research in two very different Greek communities, that honor amounted to 'socially appropriate behavior.' In a quiet, law-abiding village, macho swagger and aggressivity do not form the basis of honor.

The appreciation of the relativity of honor forced specialists into a theoretical stock taking (Gilmore, 1987). Two definable tendencies emerged: (1) honor and shame vary in form in different communities, and indeed may be found in completely non-Mediterranean societies, such as Japan where there is a great emphasis on the avoidance of shame; (2) although not exclusive to the Mediterranean, Mediterranean societies do, nonetheless, seem to converge on some strikingly similar cultural expressions of honor and shame. The gestural sign of the billy goat's horns made with extended index and baby finger, for example, signifies that a man has been cuckolded in a number of Mediterranean societies. The northern European resort to the image of the cuckoo bird to represent marital betrayal (hence 'cuckold') indicates the imagery of a different cultural area. In Mediterranean societies goats furnish the relevant vocabulary. A man who has been betrayed by his wife wears horns in Greek (*keratás*) and in Italian (*cornuto*) while in Spain he is just a big goat (*cabrón*). Unlike rams, billy goats allow their females to be mounted by other males without protest.

Performance: Class and Gender

In early modern Europe honor was mainly an affair of the aristocracy; slights from social inferiors could be ignored without consequences. The majority of early anthropologists of the Mediterranean worked in small rural communities where everyone was putatively a social equal. All men began with an equal portion of honor that they could increase or lose. A single system of honor and shame thus permeated the whole community. In larger, stratified towns or cities, however, there could be several parallel systems of honor by class. Honor itself was not economically determined, but the circles within which it was contested, and the modes of contestation, were.

There can be few societies lacking altogether in notions of precedence and social failure. The particular expressive performance of prestige in Mediterranean societies was surely what attracted the attention of anthropologists. These performances might involve elaborate verbal displays, such as the spontaneous exchange of insulting rhyming couplets, or the skilled telling of tales of sexual prowess or daring animal theft. The anthropologists recording these stories usually came from the middle classes of northern European or North American societies. Their fascination with these spectacularly different social practices precluded the recognition of their own participation in systems of honor (Pina-Cabral, 1989: p. 402). If transgressed a middle-class person might conceivably report the incident to the police and perhaps bring charges. If defamed in public, this person might register an accusation of libel and fight the case through the legal system rather than by direct, violent retribution. These practices protect personal reputation and arguably involve honor and shame, but it is not *the* system of honor and shame that Mediterraneanists had in mind.

Mediterranean honor assumed its particular form as a mode of direct action in the absence of moderating state institutions. Even where the law might be present, honor ignores its offices. The place to find similar configurations of honor and shame in many Western societies is often among the working classes or in criminal subcultures. American inner-city gangs have developed an honor culture that is perhaps even more 'Mediterranean' than that of Mediterranean societies as evidenced in the following statement by a Los Angeles Chicano gang member:

> Honor is important to me and every homey [gang member] because if you ain't got honor, you got nothing, man. I mean, no amount of money can buy you honor, so you do everything you can to protect it. I mean, without honor, nobody will respect you, not your friends or your family.
>
> (Jankowski, 1991: p. 143)

That middle-class anthropologists were apparently oblivious to these alternative systems of honor in their own societies exemplifies the earlier contention that parallel, discrete

codes for honorable comportment may operate in stratified societies.

Feminist studies of honor and shame have rejected the idea that honor is exclusive to men, and contended that women are not to be construed primarily as the passive defenders of male honor. Although their silence has been taken as a sign of submissiveness it might actually be a form of subversive irony through which women mock the supposed gender hierarchy. Furthermore, women's performances of suffering (their own pain, or on behalf of family members) can be understood as claims to respect in the community of fellow women sufferers. Dubisch (1995) has observed that Greek women engage in competitive suffering as a means of gaining prestige in the community. A gender studies model, then, where performances and social constructions of masculinity and femininity are treated independently, is increasingly replacing the honor and shame model, which linked them together in a version of normal patriarchy. Abu Lughod's (1986) study of honor and poetry among Egyptian Bedouins opened another dimension by contrasting honor as public performance of strength with the intimate vulnerability expressed in songs, thus situating honor and shame in the anthropology of emotions.

The Migration of Honor

Just as the initial optimism in the revelatory power of honor and shame began to wear out in anthropology, scholars in other fields discovered the formulation and adopted it with excitement. Where only a few books about honor and dueling in European history had been written before 1970, by the 1990s many titles had been published analyzing these themes in several European countries. In his *Southern Honor* (1982), Wyatt-Brown acknowledged the influence of Pitt-Rivers and speculated that the similarities between the American South and the Mediterranean arose because "primitive conditions of life often produce elemental social values sometimes roughly parallel from one society to another."

Like *mana* (to which Pitt-Rivers compared it), taboo, or shaman, honor belongs to middle-range anthropological theory – terms discovered ethnographically in one region and then applied to guide investigation in other societies. The Azande distinction between witchcraft (innate) and sorcery (learned), for example, has been used in the identification of witchcraft in numerous other societies. Honor and shame appear to have been discovered in Mediterranean anthropology and to have traveled out to other societies and other disciplines. Yet if we look more closely honor and shame had already traveled from early modern European history into Mediterranean anthropology via Pitt-Rivers' essay. That these concepts now seem more attractive to Europeanist historians than they do to Mediterraneanist anthropologists may well be because they actually arise directly from these historical societies. Honor and shame were indigenous concepts in early modern European society.

The future of honor and shame in Mediterranean studies is murky precisely because they do not emerge from local vocabularies. It is striking how few Mediterranean societies actually have words for 'honor' in the sense advanced by Pitt-Rivers and how infrequently equivalent terms are employed in daily life. In Greece the words *timí* 'honor' and *philótimo* 'sense of honor' are rarely heardwhereas in Italy the operative concept is neither shame nor honor, even though the latter would seem to be readily accessible in the Italian word *onore*. Instead, exemplary moral fiber is displayed by following 'the code of silence' (*omertá*) and not disclosing details of criminal or other in-group activities to inquisitive authorities. In his early monograph describing an Andalusian village, Pitt-Rivers (1954) focused attention on 'shame' (*vergüenza*) and made no mention of 'honor.'

The conception of honor brought into anthropology by Pitt-Rivers was always polysemous and this was its theoretical attraction. Honor could involve criminal aggression or Christian virtue, its forms extended into gender relations and equally into the politics and economics of patronage and mafia protection. By the 1990s anthropologists found that the vagueness of the terms honor and shame, and their mismatch with local concepts blunted their usefulness for ethnographic research and for comparison. Honor and shame looked set to be dissolved into the local terminologies uncovered by particularist ethnography, or absorbed into other frames of analysis altogether, such as psychological anthropological concepts of self and emotion.

Honor, Murder, and Multiculturalism

Honor did not, however, disappear. On the contrary, it acquired sharper definition than ever as the phenomenon of 'honor killings' began to command public attention in Western countries (Ewing, 2008). By 2010 an estimated 12 honor killings per year were occurring in each Germany and Britain with comparable statistics found in other countries with immigrant populations from areas such as Pakistan, Afghanistan, and Turkey. Police seminars, courtroom hearings, and even the European Parliament became venues where society attempted to understand the meaning of 'honor' in order to avert the damage it was causing (Wikan, 2008). Typically in these cases, kinsmen kill a young woman for pursuing a romantic relationship, or even just a Western lifestyle, which they oppose. Men may also be victims. The woman's alleged lover may be targeted, and overt homosexuality might also offer a pretext for murder. The meaning of honor has thus narrowed to refer to a kin group's protection of its reputation against taint from the sexual behavior of group members that is perceived as shameful.

In Britain, 17-year-old Shafilea Ahmed was murdered by her first-generation Pakistani migrant parents, who were sentenced to 25 years in prison in 2012. The motive for the murder might have been Shafilea's refusal of an arranged marriage during a family visit to Pakistan. In understanding them as honor murders authorities have come to grasp such crimes as corporate family decisions, condoned by a number of kin (including women). The implications for criminal charges of complicity or accessory to murder are enormous. Honor killings indicate a fatal clash between Western modernity with its recognition of individual equality and autonomy and non-Western traditions grounded in gender inequality and patriarchy. Migration to Europe has created a rift in values between generations. First-generation migrants commit the majority of honor killings

against second- and third-generation migrants who have become Westernized.

A Swedish woman of Kurdish descent, Pela Atroshi, was murdered in Iraqi Kurdistan and her father and uncle were sentenced to 6 months suspended sentences by an Iraqi court for the deed (Wikan, 2008: 39ff.). Upon return to Sweden, Pela's sister presented evidence that two of her uncles (themselves Swedish citizens) had been involved in the crime and a Swedish court sentenced them to life imprisonment. This case shows the mismatch between European laws and those of societies that recognize honor as a mitigating circumstance. Wikan raises the question that now hangs over many Western countries: "Where should a liberal state stand in dealing with illiberal immigrant groups?" (2004: p. 197). The matter has become a diagnostic test of the limit of cultural relativist, and anticolonial positioning.

Throughout its development as a concept, honor has been out of time or out of place, or both, and this has fueled its fascination for social scientists. At first it was a medieval idea surprisingly found in the contemporary Mediterranean. Then it was a Mediterranean system of values that illuminated historical European societies. Later it turned up in the inner cities of America rather than out there in the Mediterranean or Near East where it belonged. With the phenomenon of honor killings it has come to roost in the West, yet it is anomalous, perhaps symptomatic of historical transition. Honor is only unstably in place; brought into prosperous Western countries by immigrants yet many of these immigrants have become citizens. It is a temporal paradox because it has not been superseded and relegated to the European past. Honor has become, rather, a growing problem for the future of liberal plural societies, which are caught in the dilemma of how to respect cultural difference while maintaining fundamental values of individual freedom and self-determination.

Honor Killing: Multidimensional and Multilevel Perspectives

Tenzin Dorjee and Stella Ting-Toomey, California State University Fullerton, Fullerton, CA, USA

© 2015 Elsevier Ltd. All rights reserved.

Abstract

Honor killing is a crime and a social and intercultural moral dilemma in terms of understanding its motivations and possible prevention. This article presents multiple perspectives to illuminate the multifaceted dimensions of honor killing. Various contemporary ethical and theoretical perspectives on honor killing are addressed. The article is organized into four sections: honor killing as contextualized and defined; honor killing as a complex social, moral, and intercultural issue; social ecological and intercultural facework perspectives on honor killing, with an illustrative application; and finally, conclusions and future directions.

Defining and Contextualizing Honor Killing

'Honor killing or honor-related violence' is a multifaceted phenomenon that reflects a heinous social crime, a moral dilemma within societies, and an intercultural challenge. In general, while killing can be accidental, premeditated killing with malice is murder. From this perspective, honor killing is murder, typically, the murder of a female family member by her own family and/or friends to avenge shame or disgrace brought by infidelity or any other culturally unacceptable behaviors (Nasrullah et al., 2009). Women are the majority of victims of honor killing but men can suffer a similar fate (Idriss and Abbas, 2011; Welchman and Hossain, 2005). According to U.N. reports, every year as many as 5000 women are killed in the name of honor (Chesler, 2010; Smartt, 2006), which most observers think is an underestimate. The world-wide average age of female honor killing victims is 23 years. Men are also victims of honor killing (Chesler, 2010; Nesheiwat, 2005).

While honor killings can be found around the world, this article focuses on their occurrence within the cultural context of South Asia and the Middle East and addresses different aspects of honor killing from interdisciplinary perspectives. The key English terms to understand the motivations of this form of killing are 'honor' and 'perception.' 'Honor' is the English translation of the term '*izzat*' in Hindi–Urdu languages and cultures. '*Izzat*' is a broad term that includes honor, reputation, dignity, respect, social standing, and justice. In many cultures 'family *izzat*' guides social relationships and interactions (Encarta, 2009). All family members are expected to preserve and enhance family *izzat*. Social mobility from a low-status position to a high-status position via academic and professional achievement or matrimonial alliances, for example, a poor person marrying into a rich family, can enhance family *izzat*. Given the history of the caste system in India, social position is intimately related to one's *izzat* (Mandelbaum, 1988). While promoting family *izzat* would usually be commended, disgracing family *izzat* entails serious social consequences including social ostracism and even murder in the name of honor. The term 'honor killing' thus illustrates the dark side of *izzat*.

Honor killing is believed to restore family *izzat* (i.e., honor, dignity, reputation, respect, social standing, and justice). It is primarily a family *izzat* restoration strategy. Honor killing is based on a perceived disgrace or threat to the family *izzat*. For example, if a family member or friend believed that another family member had done something to disgrace her or his family (e.g., interreligious dating, disobeying the parents' wishes), the offending person would be punished accordingly in an authoritarian family system, including by death if the offense was sufficiently serious. Thus, the perception of bringing disgrace to the family is central to understanding honor killing or *izzat*-based killing (Carline, 2011; Perlmutte, 2011).

Dimensional Complexity of Honor Killing

Honor killing is a multidimensional phenomenon that requires interdisciplinary and social–ecological perspectives for breadth and depth of understanding. Below, we discuss the two major perspectives taken on the issue: conflict face-negotiation theory (FNT) (Ting-Toomey, 2005; Ting-Toomey and Kurogi, 1998) and the social–ecological framework (SEF) (Bronfenbrenner, 1977; Stokols, 1996; Ting-Toomey, 2011).

Honor Killing: The Sociocriminal Approach

Honor killing is often primarily approached as a social issue or crime and is addressed according to the legal constitution of a country (Idriss andAbbas, 2011). The main goals of this approach are social justice for the victims of honor killing and their families and prevention of honor killing in the first place (Idriss and Abbas, 2011; Welchman and Hossain, 2005).

Coomaraswamy (2005) offers a sociocriminal approach to understanding and preventing honor killing based on women's human rights and criminal law: "First, we need to ensure that we draw upon existing international standards and laws in upholding state responsibility. As Special Rapporteur, I called upon states not to invoke custom, tradition or religious considerations to avoid their obligations to eradicate violence against women and girls. …" (Coomaraswamy, 2005: pp. xii–xiii). She recommended developing national penal codes to provide protection to women irrespective of cultural practice. In this regard, scholars have investigated laws pertaining to honor killing in various national contexts such as Bangladesh, Pakistan, India, Lebanon, Jordan, Iraqi Kurdistan, Palestine, Egypt, Israel, Latin America, Italy, and United Kingdom

(see Welchman and Hossain, 2005) and other countries (see Idriss and Abbas, 2011). The laws of these different countries vary greatly in their provisions for social justice for the victims of honor killing or honor crimes. Women's rights proponents continue to advocate for the protection of women's rights, including the prevention of honor killing and full justice to its victims. A major challenge, of course, is to create uniform national penal codes prohibiting or criminalizing honor killing in nations and societies with incompatible moral values.

Honor Killing: A Moral Dimension

A moral order is the "theory by which a group understands its experience and makes judgments about proper and improper actions" (Pearce and Littlejohn, 1997: p. 51). From an intergroup perspective, moral conflicts that arise from issues such as honor killing are embedded in "incommensurate moral orders" (Pearce and Littlejohn, 1997: p. 54). These moral orders represent the most difficult forms of conflict to manage due to the multiple ways in which group members view being, knowledge, and moral values (Pearce and Littlejohn, 1997). In short, protagonists of honor killing strongly believe it to be the right course of action and represents moral justice (as a means of preserving traditional moral order), while antagonists strongly believe it is a morally reprehensible action and should be condemned and eradicated. Thus, multiple and competing ethical perspectives are brought to bear on the practice, and that creates a moral dilemma (Dorjee et al., 2013; Ting-Toomey, 1999, 2011).

Ethical absolutists believe in universal standards, notwithstanding cultural and contextual differences, and they strongly condemn honor killing as immoral action (Dorjee et al., 2013). In contrast, ethical relativists strongly believe that cultural contexts are vital to understanding different moral standards and they may suggest caution before condemning honor killing. While relativism promotes respect for all cultural standards and practices, it can perpetuate negative values and standards such as honor killing, *sati* tradition, and genital mutilation. Ethical universalists would condemn honor killing (and like practices) because they strongly believe in universal standards systematically derived from cross-cultural comparative standards and humanistic concerns. But it is extremely challenging to develop cross-cultural universal standards. Possibly, a metaethics position (Ting-Toomey, 1999, 2011) that transcends all other ethical positions can be used to understand honor killing. Such a perspective would look at honor killings case by case, always from a multilayered, contextual framework, which does not prejudge the morality of such actions. Two cases of honor killing may differ greatly due to multiple social, cultural, and contextual factors.

Honor killing posed a direct challenge to key metaethical concepts such as global social justice, identity equality and respect, human rights and freedom from pain and suffering (Dorjee et al., 2013). Importantly, how can we best ensure these metaethical issues are justly and globally respected and honored? One promising metaethical standpoint is found in the Dalai Lama's *Secular Ethics* approach. His understanding of secularism is informed by the constitution of India (Smith, 2011) wherein secularism is defined as *respecting all people regardless of faith or even no faith*. In his two classic books, the Dalai Lama (2001, 2011) persuasively argues that secular ethics is rooted in compassion – a sense of caring for others or warm heartedness – that we have inherited biologically from our mothers before we come to know of any religion or ideology. Secular ethics and the so-called 'middle way' approach can be useful in addressing many human conflict issues and cultural dilemmas (see Dorjee, 2013).

Honor Killing: Intercultural Conflict Dimension

Honor killing can also be viewed as an example of intercultural conflict, defined as the implicit or explicit emotional struggle or frustration between individuals of different cultures over perceived incompatible beliefs, values, norms, face-saving concerns, goals, scarce resources, processes, and/or outcomes in a communication situation (Ting-Toomey, 2005, 2011). From an intercultural or relational perspective, honor killing is directly related to face-saving concerns both within and between group community members. Face is an important aspect present in all social interactions. Its meanings, however, differ in specific cultures. The English term *face* (as used, e.g., in the term 'saving face') refers to a claimed sense of desired social image in a relational setting (Ting-Toomey, 1988). On the deeper level, face is a concept people use to gauge their own social self-worth and the social worth of others (Baig et al., 2014). Ting-Toomey's (2005, 2009) update of FNT explains the influence of cultural norms and values on people's behavior in different cultural communities and how face is managed in various conflict situations.

FNT recognizes three types of face concerns: self-face concern, other-face concern, and mutual-face concern. From cross-cultural perspectives, individualists are likely to be more concerned with self-face issues, but less with other and mutual-face issues. On the contrary, collectivists are likely to be more concerned with other and mutual-face issues, but less with self-face concerns. Since Hu's (1944) initial conceptualization about the meaning of Chinese face, several researchers have examined other Asian culture-specific meanings pertaining to the concept of face. For example, the Japanese term for face is *kao* (Haugh and Watanabe, 2009); and the Thai term *nâa* concerns face (Ukosakul, 2009). In Indian social–cultural contexts, *izzat* largely connotes communal face concerns. The Tibetan term *la* gya also refers to group-based face concerns such as community honor, ethnic honor, and national honor. These culturally specific explorations of face provide insight into how face concerns emerge through interaction as well as the various expected communicated rules in these cultures. Nayar (2004) explored the idea of *izzat* in intergenerational contexts with Punjabi Sikhs in Canada, and found that the value of *izzat* is "extremely strong and is expressed through the notion of behaving properly to save face, be it the family's or community" (p. 166).

The above cultural terms highlight the importance of maintaining honor or face in interpersonal and intergroup relationships and interactions. In conflict situations, individuals need facework management strategies and skills to effectively negotiate conflict goals including identity goals and relational goals. According to FNT, facework strategy consists of

two types: face giving strategy and face saving strategy (Lee and Park, 2011; Ting-Toomey, 2005). As social beings, all people want approval, respect, and acceptance. In this regard, it is vital to give others 'face,' i.e., by not humiliating others, acknowledging and respecting their identity, and communicating supportive messages in social interactions. However, when face is threatened or undermined, people employ face saving or restoration strategy. In minor face loss situations (such as not getting the expected jobs), individuals can engage in situational scapegoating attributions such as blaming all the foreigners coming in to take away the jobs. However, in major face loss situations, individuals may use sabotage strategies or even undertake drastic measures such as committing suicide or engaging in honor killing to restore face following deep face shame and humiliation (Perlmutte, 2011; Leung and Cohen, 2011; Scheff, 2011). In the case of the honor killing of Banaz Mahmod (see below) to restore family honor or izzat, the father authorized the killing of his own daughter. Societal, acculturational, situational, relational, and personal factors can profoundly shape *izzat* outlook and perspective (see Dorjee et al., 2013).

Conflict FNT in Multilayered Social–Ecological Contexts

We believe the conjoint framework of FNT and the SEF can provide the most meaningful explanation of honor killing.

Conflict FNT

Research on face and facework can be found in a wide range of disciplines such as anthropology, psychology, sociology, linguistics, management, international diplomacy, and human communication studies, among others. The concept of face has been used to explain linguistic politeness rituals, apology acts, embarrassment situations, requesting behaviors, and conflict interactions.

Ting-Toomey's (1988, 2005) conflict version of FNT explains the culture-based, individual-based, and situational-based factors that shape communicators' tendencies in approaching and dealing with conflicts. Based on the results of several large cross-cultural conflict data sets, a third version of the FNT appeared in 2005, and contained 7 premises or assumptions and 24 theoretical propositions.

Of the seven assumptions, the four relevant to this discussion are as follows: (1) people in all cultures try to maintain and negotiate face in all communication situations; (2) the concept of face is especially problematic in emotionally threatening or identity vulnerable situations when the situated identities of the communicators are called into question; (3) the value dimensions, in conjunction with individual, relational, and situational factors, influence the use of particular facework behaviors in particular cultural scenes; and (4) intercultural facework competence refers to the optimal integration of knowledge, mindfulness, and communication skills in managing vulnerable identity-based conflict situations appropriately, effectively, and adaptively.

When an individual's face image or a community's face image is being threatened in a conflict situation, she or he would likely experience identity-based frustration, emotional vulnerability, anger, hurt, and even a desire for vengeance (Zhang et al., 2012). Collectivists tend to emphasize the importance of communal face or *izzat* more highly than individualists. Individuals can experience face threats at both individual and group membership levels. In the 2005 FNT version, the following conditions were posited concerning the valence direction of an intercultural or intergroup *face threatening process (FTP)*. First, the more important, the culturally appropriate facework rule that has been violated, the more severe the perceived FTP. Second, the larger the cultural distance between the conflict parties, the more mistrust or misunderstanding accumulates in the FTP. Third, the more important the perceived conflict topic or imposition of the conflict demand, as interpreted from distinctive cultural angles, the more severe the perceived FTP. Fourth, the more power the conflict initiator has over the conflict recipient, the more severe the perceived FTP by the recipient and also the initiator. Fifth, the more harm the FTP produces, the more time and effort are needed to repair the FTP. Sixth, self-face or in-group community-face concern becomes incrementally more salient if several of these conditions are present in a FTP. For example, individuals are likely to move toward self-face saving and in-group face-saving emphasis if they perceive the escalation of the various face-threatening conditions directed at them or their salient in-groups. Cultural worldview perspectives, individual personality tendencies, and situational pressures frame the underlying interpretations of what count as a severe intercultural 'face-threatening' interaction episode. All five of these face-threatening conditions can aptly explain the intensity and perceived face-threatening level in multiple honor killing cases and in conjunction with the twisted, dark side of in-group face or *izzat*.

Multilayered SEF

In conjunction with the conflict FNT, the SEF provides us with a set of conceptual tools to sharpen our analysis from the macrolevel viewfinder to the microlevel cultural clash in an honor killing case.

Honor killing is not a random act of taking someone's life. It involves both intercultural/intergroup factors such as incommensurate moral orders, role membership expectations, institutional procedural breakdowns, and communication malfunctions to interpersonal attitudinal rigidity factors. Therefore, research that focuses on any one contextual level underestimates the effects of other contexts. For example, looking at honor killing as a mere violation of criminal law or strictly as a cultural issue would exclude insights gained from examining the interplay of macro- and microlevel factors in honor killing.

SEF is the study of people in embedded environments and the reciprocal influence between human behaviors and multiple environmental contexts (Bronfenbrenner, 1977; Stokols, 1996). Contemporary interdisciplinary research suggests the importance of a multilevel-theorizing approach to understand the complexity of human behavior (such as honor killing) in embedded contexts (Oetzel et al., 2006). A multilevel perspective enables us to understand (and possibly

challenge) the deeply held assumptions of a particular conflict approach, family/community reactions, institutional bureaucratic procedures, role expectancy violations, and cultural/religious worldview clashes.

According to Ting-Toomey and Oetzel (2013), SEP consists of five contextual levels of analysis: macrosystem, exosystem, mesosystem, microsystem, and chronosystem. The 'macrolevel' analysis focuses on the history, values, beliefs, and ideologies of a culture that influence interactants' conflict perspectives and behaviors. In comparison, the 'exolevel' analysis looks at the influence of established institutions and their formal procedures or policies on the community and individuals' reactions and actions. Meanwhile, the 'mesolevel' analysis examines the influences of immediate groups (e.g., family) and organizations (e.g., the workplace or religious groups) on the conflict parties and conflict episodes. The 'microlevel' analysis looks at both intrapersonal (e.g., identity issues and attributions) and interpersonal (e.g., the actual face to face or social media interactions) levels of interpretation and communication manifested in the actual conflict settings. The final level, the 'chronosystem level' refers to the developmental time span of the case history. Together, these multicontextual levels of analyses can provide a comprehensive understanding of diverse conflict situations – from everyday intercultural-intergroup conflicts to abusive family conflict events.

Furthermore, social ecological analytical concepts include three types of cross-level effects: (1) top-down effects, (2) bottom-up effects, and (3) interactive effects (Klein et al., 1999; Ting-Toomey and Oetzel, 2013). *Top-down effects* refer to how the larger cultural and institutional forces shape the intercultural conflict stance or practice – from the macro, the exo, the meso, to the microlevel. From this vantage point, individuals' conflict ideologies and practices are shaped by the various layered structures in which people are nested hierarchically (e.g., does the larger cultural worldview or institutional level emphasize communicating apology or forgiveness and does the effect spill downward to the lower levels?). *Bottom-up effects* focus on how lower levels (e.g., individuals and interpersonal relationships) affect higher levels (e.g., workplace, media news to institutional policies, and then cultural change). These types of effects are not as prevalent in the literature as are top-down effects, but they are no less important. *Interactive effects* involve simultaneous and mutual effects at more than one level. In some cases, the effects of one level (e.g., culture) moderate the outcomes at another level (e.g., family policies). Unlike top-down or bottom-up effects, interactive effects assume simultaneous process impacts at multiple contextual levels.

Conflict Face Negotiation and Social–Ecological Integrative Lens: A Theory–Practice Application Case

SEF enables the multicontextual level analysis of richly dense conflict cases such as the honor killing story presented below. In applying the analytical concepts of SEP in a systematic manner, we can explore the interplay of various complex-layered factors that frame honor killing, lead to deeper insights and suggest more compassionate ways to circumvent such heinous crimes in the future. Due to space limitation, we will present an excerpted honor killing story from the work of Dorjee et al. (2013; for a complete story rendition and detailed analysis, please consult Dorjee et al., 2013). The case amplifies intercultural conflict among the key characters: the victim – Banaz Mahmod; her father – Mahmod Mahmod; and her uncle – Ari Mahmod, The case also exemplifies the cultural clash of the mainstream U.K. community, the Kurdish community living in the UK, and the Mahmod family. An abridged story of her brutal murder is described below.

Banaz Mahmod was a 20-year-old, Iraqi-Kurdish female, living in Surrey, UK. She was murdered in her home in January 2006. Strangled with a bootlace, her body was stuffed into a suitcase. Several months later, the suitcase was found buried more than 100 miles away, under a house in a Birmingham suburb. Banaz's father (Mahmod Mahmod) and uncle (Ari Mahmod), along with three other accomplices, were arrested as murder suspects in the honor killing.

Following cultural practice, Banaz had been forced to marry an older man at the age of 17. She returned to her parent's home when her 'arranged' husband proved to be abusive and violent. Later she met Rahmat Sulemani, a young Iranian Kurd, and fell in love with him. A cousin saw Banaz kissing Sulemani outside the tube (train) station informed the father and uncle, who then decided to kill her for this offense.

Banaz learned from her mother about the death penalty and went to the police with the information, but she was evidently not persuasive and her situation was ignored. On 23 January 2006, Banaz also informed local police about the threats to Mr Sulemani's life and stated again the threat to her's. Although the police offered her a safe place to stay, she returned home believing that her mother would protect her from harm. The very next day, her father and uncle recruited three young Kurdish men to kill Banaz in the family home. Investigators found her body 3 months later on 28 April 2006.

Her uncle and father were charged with murder, while the three other men were charged with perverting the course of justice. The father and uncle were found guilty and sentenced to at least 20 and 23 years of life imprisonment, respectively. During the court hearings, it became obvious that Banaz was murdered to redeem the family honor. The prosecuting attorney told the court that her family decided that Banaz had shamed the family and should pay the ultimate price. The father was without remorse and clearly believed that the perceived loss of reputation was more important than his daughter's life.

Social Ecological Macrolevel and Exolevel Analysis

Macrolevel analysis provides insights into the historical, ideological, and cultural contexts related to the honor killing of Banaz Mahmod. Iraq, Iran, and Kurdistan have been involved in conflicts for decades (Hardy, 2005). The Kurds were caught in the middle of the Iran–Iraq war that lasted for 8 years; 100 000 Kurds who fled to Iran were killed. Against this backdrop, the Mahmod family escaped the Iraqi Hussein's regime and sought political asylum in the United Kingdom. They settled in UK and, as with most immigrants, tried to retain their native culture and traditions.

In particular, they adhered closely to the most repressive form of patriarchal ideology according to which women are not entitled to make any decisions about their own lives

(Idriss, 2011). In the case of Banaz and her sisters, patriarchal ideology (a macrolevel factor) strongly influenced the male family members' decision to kill her. Both ethical absolutism and ethical relativism can constrain our understanding of this murder case because the former involves ethnocentric culture-bound evaluation and the latter perpetuates honor killing in the name of an ethnorelative cultural viewpoint.

A metaethics perspective, however, elucidates the story. From this point of view, Banaz Mahmod had universal and civil rights (e.g., the right to life and justice, and the right to form voluntary social relationships) regardless of her cultural group membership. These rights were violated in her killing. Other factors involved her death are historical conflicts and religious differences. Banaz was an Iraqi and her suitor Sulemani was an Iranian (although they both were Kurds).

From the point of view of FTP, the following features of the killing are salient: First, this expectation of arranged marriages and fidelity within these arranged relationships is extremely strong, as is the patriarchical *motif* within Kurdish families. Maintaining *izzat* (honor, respect, and face concern) is what one does within a collectivistic Muslim cultural community. As Condition 1 in the conflict FTP states: First, the more important the culturally appropriate facework rule is violated, the more severe the perceived FTP. Condition 3 posits: The more important the perceived conflict topic (i.e., Banaz's running from her marriage and engaged on her own intergroup dating practice) or imposition of the conflict demand, as interpreted from distinctive cultural angles, the more severe the perceived FTP. Finally, Condition 6 in FTP states: Self-face or in-group community-face concern becomes incrementally more salient if several of these conditions are present in FTP. The perception of her father, uncle, and the *cultural* in-group was that Banaz had clearly violated important (even sacred) cultural norms; she defied patriarchy and fell in love with someone from the out-group. Death was the only appropriate punishment. Indeed, it can probably be said that none other was even contemplated. The topic of face-violation shame was perceived as so severe that her life had to be snuffed out prematurely. Concurrently, on the social–ecological exolevel analysis, the conflict FTP also posits in Condition 2: The larger the cultural distance between the conflict parties, the more mistrust or misunderstanding cumulate in the FTP. How the British police engaged in standard procedures to deal with the Banaz Mahmod's family conflict case events showed a wide gap of cultural distance and cultural insensitivity and blundering practices. At this level, established institutions, formal procedures, and their accompanying policies also contributed to the tragic murder of young Banaz. This highlights the importance of using the SEF to train all police officers to understand the cross-level effect between macrolevel/exolevel and microlevel conflict factors in exacerbating a life threatening case to the eventuality of a heinous murder outcome case.

Social Ecological Mesolevel and Microlevel Analysis

At this level, individual's behavior is influenced by immediate groups, community support or lack of it, and certain organizations. For example, the father was continuously harassed and rejected by others in his in-group community for his dereliction of duty as a man and a father when Banaz's elder sister Bekhal had absconded the parental home following the uncle, Ari Mahmod's threat to her life for talking to an unrelated man. Thus, to restore and also protect the honor, status, moral face of the family, the father decided for Banaz's murder. Indeed, the Daily Mail (2007) reported that Banaz's family and the traditional members of the Iraqi-Kurdish community in the UK believe that her family's actions were justified. This critical point also highlights the cross-level interactive effect between the meso- (i.e., the in-group community pressure and reaction) and microlevel (i.e., the actual honor killing conflict story) factors.

The microsystem social–ecological level of analysis comprised of both intrapersonal (i.e., personal and social identity issues) interpretations and interpersonal conflict communication processes as they played out over time. Three incidents stand out at this level in Banaz's story. The first is her forced marriage (at the age of 17) and her subsequent divorce from an abusive husband. This alone may have angered her family as they believed she 'brought shame' to the family via divorce. Second, her secret romantic relationship with Sulemani angered her family for multiple reasons, chief among them the apparent promiscuity that this suggested (their kiss at the exit of the train station was photographed by a cousin and presented to the father as incontrovertible proof of her insult to izzat). Third, due to concerns about community izzat and family honor, members of the Kurdish community were enlisted to help the family slaughter the young woman.

The dynamic of face concerns and pressurized negative reactions (both real and potential ones) from Mr Mahmod's in-group community seemed to have ruled out any option for constructive conflict negotiation or dialogue. Concurrently, police blunders and cultural insensitivity also contributed to the tragic death. The conjoint perspectives elucidated in this discussion contribute to a broader and deeper understanding of honor killing.

Conclusions and Future Directions

Honor killing, we have argued, is a complex, multifaceted cultural behavior that should be looked at from a conjoint ecological and social, psychological perspective. The SEF provides analytical tools to examine various social, cultural, and moral contexts and their interplay; FNT and the motif of *izzat* offer deeper explanations of the clash of intergroup 'facework violation' situations.

Honor is an element of face that involves the emotions of acceptance and rejection, pride and shame, punishment and vengeance, and restorative justice and forgiveness. Honor killing is therefore an ultimate, drastic face restoration move that cleanses izzat and restores in-group approval.

Six directions for future research on honor killing should be considered. First, what is the relationship between the various face concerns (i.e., self-face, other-face, mutual-face, and community-face) and the various dark facets of face emotions (i.e., shame, guilt, pain, hate, revenge, retribution, and redemption)? Second, how can we restore face imbalance when cultural or community face has gone beyond the tipping point? Third, how can we educate or train individuals in various public institutions (e.g., police, counsellors, social

workers) to be culturally face-sensitive and simultaneously be humanely astute in their situational appraisal of a cultural dilemma? Fourth, what would forgiveness look like in the context of such a heinous crime – how does face concern relate to intercultural-intergroup faith, hope, compassion, and restorative justice? Fifth, culture-sensitive face attunement, dialogue, and forgiveness are interdependent and intertwined. What culturally intelligent strategic facework actions at each chronosystem turning point could have changed the outcome? Finally, to whom should other family members (or perhaps, other in-group community resources, sacred symbols, or languages) appeal in times of cultural crisis that would defuse murderous rage?

Honor killing is an inverse mirror image of key metaethical concepts such as global social justice, interpersonal equality and respect, cultural sensitivity, individual and human rights, and the triumph of freedom from the conditions of human suffering. From a humanistic perspective, if we were to actively seek knowledge and understanding of 'unfamiliar others,' they would presumably feel accepted and thus, less likely to need to save face through honor killing. From SEF, institutional host members and immigrant individuals also need to come together to learn a community peace-building dialogue and language – in order to live with dreams, hopes, forgiveness, and ultimately, humanitarian renewal and faith.

Hooking up and Casual Sex

Paula England and Shelly Ronen, New York University, New York City, NY, USA

Abstract

'Hookups' refer to casual sexual encounters that do not necessarily involve intercourse. While premarital sex has been common for decades, the hookup culture is distinctive in that sexual behavior is accepted in casual liaisons. Several forms of gender inequality in the hookup culture are identified: less attention is given to women's than men's sexual pleasure, women are judged more harshly than men for engaging in casual sex, and sexual coercion and assault are not uncommon. Sexual behavior does not differ appreciably between youth in different social classes, but more disadvantaged youth contracept less consistently and are more likely to have unplanned pregnancies. Media attention on hookup culture mirrors past feminist debates about sexuality, since the central question is whether hooking up is good or bad for women.

'Hookup' is the term that youth use to refer to casual sexual encounters. Hookups often begin in a social setting, such as a party, during which two students meet and something sexual happens between them that night. Those 'hooking up' are usually not strangers, and they do not necessarily have an interest in further contact or a romantic relationship when they have these mostly consensual encounters. Hookups can involve a range of sexual behaviors: from kissing or 'making out' on a party dance floor to touching, oral sex, or intercourse in private settings. The term has become widespread among students across public and private universities in the United States (Glenn and Marquardt, 2001; England et al., 2008). Sex outside of romantic relationships is also common among less privileged students who do not attend universities. Here, we focus largely on the growing literature on heterosexual hooking up.

Trends in Premarital and Casual Sex

Hookups involve premarital sexual behavior of some sort, not always intercourse. Formerly a taboo, intercourse before marriage has become largely accepted in many affluent societies. Highly religious subgroups teach that it is morally wrong, and their members often delay sex longer than others, but often end up having sex before marriage despite their belief against it (Regnerus, 2007). Approximately 90% of Americans born after 1960 have had premarital sex (Finer, 2007). Similarly, among French men and women born after 1967, only 11 and 7%, respectively, reported that their first intercourse was after marriage (Hubert et al., 1998: p. 55).

While premarital sex is noncontroversial for most, in the United States the higher rate of teen births than in other nations has led to substantial policy concern about teen sex. Defining 'teen' as those under 20, Hofferth et al. (1987: p. 49, Tables 3 and 4) use the National Survey of Family Growth, and report no clear trend in teenage intercourse between those born in 1938 and 1950, but for those cohorts born between 1950 and 1967, they find a clear upward trend for both black and white women in the proportion of unmarried teens who had experienced intercourse. Similarly, Laumann et al. (1994: p. 325), using data from the 1992 National Health and Social Life Survey, find no trend in mean age at first intercourse between black or white women born in 1933–42 and those born 1943–52, but find declines in mean age between the 1943–52 and 1953–62 birth cohorts. However, since the late 1980s, involving cohorts born since 1970, there has been a decrease in teen sex in the United States, perhaps in response to HIV. For example, in 1988, 51% of teens aged 15–19 years had had intercourse at least once, but among those at these ages in 2008, only 43% had had intercourse (Martinez et al., 2011).

The trend toward a higher proportion of youth having premarital sex does not tell us whether the bulk of premarital sex is experienced by couples planning to marry each other, couples in monogamous relationships without a plan to marry, or in more casual liaisons. Hookups, it is claimed, are a new phenomenon in that they are entirely outside even the modicum of commitment entailed in a boyfriend–girlfriend romantic relationship. Indeed, qualitative research on hookups claims that sometimes the sex comes first in a hookup and later some small proportion of the couples who hook up decide to be in a relationship (England et al., 2008). Of course, casual sexual behavior is not entirely new, as the decades-old use of the phrase 'one night stands' reveals. In fact, however, we lack systematic data on change over time in whether nonmarital sex is in casual or relational contexts. Yet, many authors suggest that the prevalence, visibility, and acceptance of casual sex have increased in recent decades (e.g., Garcia et al., 2012), leading to a hookup 'culture,' which implies that casual sexual behaviors are normatively accepted, at least within parts of the youth culture. It is perhaps more accurate to call it a subculture, since, for example, highly religious youth, especially those in conservative denominations, are less likely to hook up (Burdette et al., 2009), and many students have few if any hookups (England et al., 2008).

Behaviors Occurring in Hookups and Contexts in Which Hookups Occur

While hookups, as students use the term, always include some sexual behavior, they do not always involve intercourse.

England et al. (2008) report on data from the Online College Survey of Social Life, a survey of students from a number of colleges and U.S. universities. The survey asked students if they had hooked up in college, and instructed them to "use whatever definition of hookup you and your friends use." Of those responding students who were seniors, 76% had hooked up in college; the median number of hookups (retaining those with none in the analysis) was 5 (England et al., 2008: p. 533). Those who had hooked up were asked what happened sexually on their most recent hookup; among heterosexual students 31% 'made out' and/or did some nongenital touching, but had no genital contact, 16% had some hand/genital contact but did not have oral sex or intercourse, 15% had oral sex but not intercourse, and the remaining 38% had intercourse (England et al., 2008: p. 533). Thus, while the term 'hookup,' as used by students, always implies some physical contact, it does not necessarily entail intercourse, and hookups are quite diverse. Sometimes, students hook up two or more times with the same person. Of all the recent hookups students reported on, about half were the first time hooking up with this person, 11% were the second time, 8% were the third time, and so on with fewer for each successive time. Students were more likely to have intercourse on a hookup if they had hooked up with the person before (England et al., 2008: p. 534).

The term 'hookup' is in use among some high school students. Manning et al. (2006) asked secondary school students who had had intercourse whether they had done so with someone who was not a boyfriend or girlfriend; 61% of sexually active teens had done so. Most of these were not 'one night stands' and were not with strangers; rather they were typically with friends or with ex-boyfriends or ex-girlfriends.

Among university students, hookups can begin at social events such as parties. For those hookups in which only kissing or 'making out' occurs, they sometimes take place entirely at the social event, rather than in a private place. Armstrong and Hamilton's (2013) qualitative study of women's experiences at a US university identifies a 'party pathway' that some students follow. Women who follow this pathway most frequently are from relatively high socioeconomic status backgrounds; many of them join sororities, and few are very serious students. The university party scene is time-consuming, and sometimes comes into conflict with the academic portion of the university experience (Armstrong and Hamilton, 2013).

Parties are sites in which highly gendered norms prevail in initiations of sexualized dancing known as 'grinding' (Ronen, 2010), pairings that can lead to hookups. Sexualized dancing and making out on the dance floor may be a prelude to leaving to go somewhere private to pursue sexual activity. In addition, parties are sometimes the sites of sexual assault or rape. Parties are often hosted by fraternities in their residential houses; public spaces are dark, and music is loud, making conversations difficult. Partygoers seeking an alternative may be invited to fraternity members' bedrooms. Women are encouraged, if not compelled, to dress provocatively to go to parties: perpetuating gendered standards of appearance by which women end up more often cold, exposed, or uncomfortable. Gendered norms lead to expectations that women will be 'nice.' The combination of these factors at party settings sometimes leads to sexual assault (Armstrong et al., 2006).

Hookup Culture and Gender Inequality

Researchers have identified a gendered double standard in hookup culture, under which women are judged more harshly than men for casual sex or for having what is perceived as too many partners. Men do not face the same risks to their reputations as women (Sprecher et al., 1987; Crawford and Popp, 2003; Bogle, 2008; Kreager and Staff, 2009). They may even earn the distinction of 'player' or 'stud' for hooking up, especially within male peer groups. A woman who has many hookups is more likely to be known as a 'slut' or 'whore,' pejorative terms that may render her less attractive as a longer term partner, or girlfriend. Of course, the double standard is not a recent innovation, but has been present for centuries, and always entails applying some standard of what sexual behavior is unacceptable more stringently to women than men. However, the rise of casual sex or hookup behavior has shifted *what* sexual standard is applied differentially to men than women. When any sex before marriage was less accepted than it is now, condemnations of women focused on whether they had had premarital sex, with more leeway given to men. The rise of the hookup as a social form has changed the focus to number of sexual partners, and how readily one has intercourse in casual contexts. Some qualitative data suggest that this is now the focus of the sexual condemnation of women (Armstrong et al., 2012).

This cultural double standard is observed beyond students' attitudes about hooking up. It seems rooted in a cultural belief that men are more entitled to sexual agency and pleasure than women. This is one way to interpret the fact that, both in public and private, sexual behaviors prioritize men's pleasure over women's. The common form of dancing at college parties involves woman's buttocks 'grinding' against men's groins, a configuration best suited to produce men's genital stimulation and pleasure (Ronen, 2010). Moreover, reports of orgasm in hookups occurring in private show a large gender gap. Men have orgasms much more often in hookups than women; however, in sex in relationships, the gap is much narrower. Armstrong et al. (2012) show that women report orgasms in 42% of hookups with intercourse compared to 74% of relationship events involving intercourse. The authors draw on qualitative interviews with men and women to suggest that, while women concern themselves with men's pleasure in both relationships and hookups, many men readily admit that they focus only on their own pleasure, and devote considerably less effort to women's pleasure in hookups. This suggests that the notion of women's entitlement to pleasure is less accepted in the hookup than the relational context.

A final type of gender inequality in the hookup culture is sexual coercion or assault. Of course, coercive sexuality can and does happen in relationships as well as in hookups.

In the party scene, expectations that party attendants drink heavily and trust their partymates enhance the risks of sexual assault, as does women's frequent dependence on male party hosts for rides back to their own residences (Armstrong et al., 2006). Sexual assault is even more common in poor communities among youth not attending university (Miller, 2008; Jones, 2010).

Gender Differences in Preferences for Hookups versus Relationships

Conventional wisdom suggests that men are more interested in sex, especially casual sex with varying partners, while women prefer sex within monogamous relationships. Research backs some of this up, showing that women connect sex and love more than men, and women desire fewer sexual partners (Baumeister et al., 2001; McHugh, 2006). These observations would suggest that men would embrace the hookup culture more than women. Consistent with this, one qualitative study of university students showed that women talked more than men about preferring relationships to hookups (Bogle, 2008). Of course, like all gender differences, these preferences regarding the casual sex in hookups involve overlapping distributions, so some women enthusiastically embrace hooking up. In trying to explain the existing gender difference, some authors prefer an evolutionary argument (Baumeister and Vohs, 2004; Regnerus and Uecker, 2011). Regnerus and Uecker (2011) found that casual sex with a number of partners was associated with depression for female but not male youth and interpret this in terms of hard-wired sex differences in psychology. Others suggest that women, faced with the double bind of potential stigma, and seeing that hookups often do not work in their favor, prefer to get into relationships to be able to have sexual pleasure and a good reputation (Bogle, 2008; Backstrom et al., 2011). In other words, women's preference for relational sex may be, in part, a result of the double standard in which men do not respect casual partners and thus do not care about their pleasure (Armstrong et al., 2012).

Although women have orgasms more often in relational sex than in hookups, not all research supports the idea that relationships are better for young women. Based on their ethnographic and interview study of women students at a Midwestern 4-year public university, Hamilton and Armstrong (2009) conclude that women are more often harmed by bad relationships than by casual hookups gone awry. Women complained about boyfriends who tried to control the time they spent with friends. For those from upper middle-class backgrounds, relationships interfere with what the young women see as 'self-development projects,' or the main goals of college – schoolwork and meeting people. Relationships create a risk of getting drawn toward marriage too early, and for women from working class backgrounds, relationships with men back home sometimes pull them out of college. This suggests that hooking up may have emerged in part in response to the lengthening of the typical time in the life cycle between first sex and marriage.

Social Class Differences in Sexual Behavior and Its Consequences

In the United States, youth from more advantaged homes, as assessed by the education of their parents, have their first intercourse slightly later; the difference in timing is about a half year between a youth whose mother did not complete high school and one who is a college graduate (England et al., 2012). However, Wu and Martin (2013) show that neither racial nor socioeconomic differences in age at first intercourse explain much of racial and socioeconomic differences in the probability of having a nonmarital birth. The class difference that is more consequential is that advantaged youth and young adults use birth control more consistently. As a result, they are much less likely to become parents early, to have nonmarital births, or to have unintended births at any age (England et al., 2012; Musick et al., 2009). A number of explanations have been offered for the class differences in consistency of contraceptive use. Economists argue that young women who know that their educational and job trajectory will lead to good paying jobs have higher opportunity costs of having a birth that will derail this trajectory (Hotz et al., 1997). Another possibility is that class differences in parenting styles contribute to differences in having sufficient planfulness and self-regulation to achieve efficacy at contraception (England et al., 2012).

In the low-income context where birth control use is often inconsistent, casual sex is likely to lead to births that are not only outside of marriage, but are outside of any durable relationship. Qualitative work on those living in impoverished inner-city neighborhoods show that pregnancies are common in both casual and serious relationships. In both cases, couples often rally to try to raise the child together, although most relationships do not last longer than a few years (Edin et al., 2011; Edin and Nelson, 2013). A nationally representative sample of nonmarital urban births in the United States shows that approximately 80% of the parents are romantically involved at the birth, and half are cohabiting; however, fewer than a third remain together 5 years after the birth (McLanahan, 2011). The child is then generally raised by the mother, and often later co-resides with one or more of the mother's subsequent male partners (McLanahan, 2011).

Are there class differences in the propensity to have sex in casual versus relational contexts? Manning et al. (2006) examined the determinants of engaging in heterosexual intercourse within 'nonromantic' (by which they meant outside of girlfriend–boyfriend relationships) versus romantic dyads. They found that among secondary school students who had had intercourse, controlling for other variables, experience with nonrelational sex was more common for African Americans than those of other races, but was also more common for students whose mothers had higher education. Another possible indicator of whether sex is fairly casual is how early within a partnership it occurs. England et al. (2011) found no effect of a youth's mother's education on whether youth had sexual intercourse within 1 week of meeting a partner. Thus, it appears that the most important sex-related difference by social class is how much birth control is practiced rather than sexual practices themselves.

Attention to Hooking up by Journalists and Other Cultural Commentators

Perhaps galvanized by the new term, hookup culture has received attention in the popular press, which features debate over whether the phenomenon is good or bad, especially for women. Journalist Laura Sessions Stepp (2007) argues that women seem to have unwisely accepted hooking up even though it does them emotional harm. Feminist writer Jessica Valenti (2009) offers a critique of this perspective as promoting repressive understandings of feminine purity. What's harmful according to Valenti is not casual sex but a 'moral panic' about casual sex. The term 'moral panic' refers to frenzied public concern about social phenomena, which turns to volatile outcry that is disproportionate to the problem identified. Feminist writer Ariel Levy (2005) suggests a different critique of the hookup culture than that offered by Stepp. She provocatively asks whether the gendered and sexualized culture that characterizes parties where students hook up can really be empowering for women, who seem too concerned with status, or whether men will find them 'hot,' to consider their own sexual pleasure. In Levy's view, it is this 'raunch culture' of constant, excessive, and internalized sexualization that leads to women's lack of access to pleasure. These journalists and cultural commentators, while not exhaustive or entirely representative of commentators' views, are suggestive of the diversity of opinion in contemporary debates about hooking up in the media. Furthermore, they show that contributors to the debate consistently return to questions about gender inequality and whether and how hooking up might be detrimental to women (Armstrong et al., 2010).

A defining part of hookup culture is a separation of sex from romantic relationships, just as the sexual revolution of the 1960s followed by the early women's liberation and gay liberation movements separated sex from marriage. While hookup culture is not political like those social movements of the 1960s to 1980s, it yields some similar cultural consequences. Both the hookup culture and preceding sexual and feminist 'revolutions' liberalized sexual norms and lead to the acceptability of sex for pleasure. The controversies surrounding the hookup culture echo aspects of the feminist 'Sex Wars' of the 1980s, when feminists debated the legitimacy of sexual practices such as viewing pornography, lesbian sadomasochism, and commercial sex work (Samois, 1982; Lederer, 1980; Duggan and Hunter, 2006). The fundamental controversy centered on whether women's sexual agency led to empowered experiences of pleasure, or rather, whether certain types of women's sexuality spelled danger because they were shaped by male power and employed in the service of patriarchy (Vance, 1984). For example, in an unusual alliance with conservatives, some feminists argued that pornography is inherently patriarchal and harmful to women (Dworkin, 1989; MacKinnon, 1985, 1991; Russell, 1993). Against this alliance, self-described 'pro-sex' feminists argued for women's equal right to define and enjoy sexual pleasure, including pornography (Snitow et al., 1983; Rubin, 1993; Califia, 1994). Political and legal battles ensued around antipornography legislation, championed by feminists Andrea Dworkin and Catherine Mackinnon. According to their perspective, pornography enacted and promoted male violence against women, and so banning pornography would be a step in the direction of gender equality. Feminists opposed to the antipornography legislation argued that this logic misunderstood the sources of female sexual subordination and promoted traditional restrictions on women's sexual agency (Hunter and Law, 1987). Contemporary debates about hooking up suggest a similar divide between those who think casual sex can be pleasurable and those who see danger in hookup culture. Like the Sex Wars before them, contemporary debate is mired in an irresolvable quandary, which suggests that hookup culture offers some combination of both liberated access to pleasure and increased risk of danger.

Hope and Hopelessness

This article is a revision of the previous edition article by C.R. Snyder, volume 10, pp. 6907–6909, © 2001, Elsevier Ltd.

Abstract

This article provides a brief review of the literature on hope and hopelessness. The major approaches and measurements of hope and hopelessness are discussed. Differences between hope, hopelessness, and related states such as optimism and anxiety are briefly described. Approaches to increase hope and decrease hopelessness are outlined. The article also raises several questions for future research.

Hope is a virtue highly regarded by ancient writers and contemporary authors. It is featured in the famous myth of Pandora, who, upon opening a sacred jar, unleashed all forms of evils into the world, but found Elpis, the Spirit of Hope, remaining in the jar. Many religions, including Buddhism, Christianity, Hinduism, Islam, and Judaism, propounded hope-related beliefs. For instance, the Apostle Paul considered hope to be among the three greatest Christian virtues, alongside faith and love (1 Corinthians, 13: 13). Hope was also endorsed by many philosophers, including Plato, Sophocles, and Nietzsche, as a virtue or even a necessity. Even Napoleon is said to have once proclaimed: "A leader is a dealer in hope." Hope is also a regular theme in modern popular culture. For example, hope empowered the fight against tyranny in Star Wars and sustained the arduous journey to Mordor in the Lord of the Rings.

Many psychologists see hope as critical to psychological and physical well-being. For example, Snyder (2002) wrote that hope enhances physical and psychological health and plays beneficial roles in psychotherapy. Vaillant (2003) sees hope as important in assisting the elderly to adapt to aging. Hope has been found to positively predict interest and effort in studying, and learning (Pekrun et al., 2002). Hope compels one to remain committed to difficult goals, often in spite of insurmountable obstacles, instead of abandoning them. Hopelessness, however, not only causes one to abandon goals but also can lead to negative, sometimes devastating, consequences including depression and suicide. This article aims to give a brief review of the literature on hope and hopelessness, touching on the different theoretical approaches, measurement methods, and empirical evidence.

Approaches and Measures of Hope

One well-known approach posits hope as a cognitive expectancy with respect to specific goals. This approach has its roots in the 1950s and 1960s during which psychologists such as Stotland (1969) and psychiatrists such as Menninger (1959) defined hope as a positive expectation for goal attainment. More recently, Snyder (2002) significantly extended the cognitive approach through his theory of hope, which postulates hope as a cognitive, goal-oriented mindset. In his model, hope comprises two expectancies. The first concerns the belief that one is capable of executing the means to attain desired goals (agency thinking) and the second refers to the belief that one is capable of generating those means (pathways thinking). In this model, the combined experience of agency thinking plus pathways thinking gives the experience of hope.

Snyder and his colleagues developed the Hope Scale (with both trait and state versions) to assess agency and pathways thinking and, in a solid program of research, demonstrated that the measure reliably predicted numerous desirable outcomes, such as academic achievement, athleticism, physical well-being, and psychological adjustment (Snyder, 2002). Although agency thinking and pathways thinking are distinct constructs, they are represented by a single higher-order hope factor and thus can be combined as a unitary measure (Snyder et al., 1991).

In positing that hope is the combination of agency thinking and pathways thinking, Snyder (2002) argues that hope would not occur if either one of these expectancies is absent. His view has sparked considerable debate. Some researchers have pointed out that his model cannot explain why some people can remain hopeful even when they feel that there is nothing they can do to get what they want (Aspinwall and Leaf, 2002; Bruininks and Malle, 2005). Also, people often feel hope for others whose problems they cannot do anything to help (Averill et al., 1990; Bruininks and Malle, 2005). These findings suggest that hope can be felt without pathways thinking, which directly contradicted Snyder's view. Indeed, it was found that only agency thinking correlated positively with self-report ratings of hopefulness (Tong et al., 2010). Also, while acknowledging that the Hope Scale can predict important outcome variables, researchers have pointed out that the scale assesses goals, not necessarily hope. Finally, hope is widely seen as an emotion. Even if it does comprise agency thinking and pathways thinking, hope cannot be reduced to just these cognitive expectancies (Tennen et al., 2002).

An alternative approach conceptualizes hope as an emotion. For instance, Plutchik (1980) states that hope is a positive emotion characterized by a sense of anticipation. Fredrickson (2009) sees hope as a positive emotional reaction when things are going well and the future is hard to predict, and theorizes that hope broadens resources by enabling us to see the broader scheme of things. Pekrun (e.g., Pekrun and Stephens, 2010) posits that hope is an activating positive emotion, one that promotes task focus, intrinsic motivation, and flexible cognitive strategies.

Researchers in this approach also examine the adaptive functions and components associated with hope. Hope, like other emotions, is an adaptive response. It is associated with an adaptation function that has been evolved to facilitate effective navigation of specific environmental demands and comprises several components (e.g., subjective feeling, motivational urges, cognitive processes, physiological responses) that serve this adaptation function. This approach does not discount cognitive expectancies as an integral part of the hope experience, but conceptualizes them as among the several components that support its adaptation significance.

The adaptation function of hope is to keep a person focused an obstructed goal, instead of abandoning it (Lazarus, 1991). What could be the components of hope? Subjectively, hope appears to be, at best, moderately pleasant to experience (Smith and Ellsworth, 1985). This may not come as a surprise because the type of situations that typically evoke hope are those in which a valued goal has yet to be attained and formidable obstacles exist to prevent one from attaining it. Its motivational urge is to sustain focus on the unattained goal and fuel the expectation that the goal can be attained despite the uncertain prospect. Hope is also associated with a specific manner of perceiving events. A hopeful person tends to be highly cognizant of whether the current situation is favorable to achieving a goal, view the chances of attaining the goal as uncertain but not impossible, and appraise the situation as controlled by forces that are hard or impossible to control (Roseman et al., 1996; Smith and Ellsworth, 1985). A common thread in these findings is that, in contrast to Snyder's model, people often remain hopeful even when they know that there is nothing they can do to get what they want. In such cases, their hope appears to be sustained only by the sense that their goals can somehow be attained, even if they believe that they are incapable of attaining them (Aspinwall and Leaf, 2002; Averill et al., 1990; Bruininks and Malle, 2005; Tong et al., 2010).

These findings are typically based by methods that directly assess hope experiences. Some studies used the recall method in which participants recollected personal hope experiences and rated measures that assessed specific components (e.g., Bruininks and Malle, 2005; Roseman et al., 1996; Smith and Ellsworth, 1985). Other studies instructed participants to rate their current experience on simple but face-valid hope items such as "How hopeful do you feel now?" (e.g., Smith and Ellsworth, 1987; Tong et al., 2010). Such methods examine how hope is understood by laypersons, instead of predefining hope, which is the core of Snyder's approach. However, despite its apparent advantage in ecological validity, these methods have their share of problems. Recall data can be questioned because of memory concerns. The linguistic labels 'hope' and 'hopeful' can be understood differently by different participants (e.g., participants can interpret these labels to mean optimism, wishing, wanting, or other related constructs). This problem is exacerbated whenever there exists varying cultural interpretations of the labels. Further, there remains much research to be done on other components of the hope experience. It is not clear, for instance, whether hope has a specific and identifiable bodily expression. Does it carry a unique facial expression? Does it have an identifiable bodily posture and movement? Is it associated with a distinctive set of autonomic and neurological activation?

The third, new but promising, approach contains elements of both Snyder's cognitive approach and the emotion-componential approach. Scioli et al. (2011) argue that existing conceptualizations of hope focus too strongly on its goal-oriented function, and ignore the wider cultural and spiritual systems in which hope could be situated. They propose a multifaceted, contextualized view of hope that incorporates perspectives from nursing, philosophy, psychology, psychiatry, and theology. They postulate that hope is driven by four domains. First, in the domain of attachment, hope can be instilled by a supportive social environment (e.g., family, community). Accordingly, the hopeful individual can trust in the availability of a social other who endorses his/her endeavors and can assist him/her (Herth, 1991). Second, in the domain of mastery, hope is inspired by the sense that goals can be achieved and challenges can be overcome. This domain most resembles the goal-oriented function in Snyder's goal-setting framework. Third, the domain of survival captures hope in extreme situations – crises that involve loss, pain, and even death. In these circumstances, personal resilience is thoroughly tested and hope is often dependent not on personal strengths, but on social networks and religious beliefs. This domain addresses the point that some researchers have made, as outlined above, about hope being not related to just personal control. Finally, in the domain of spirituality, hope is inspired and sustained by spiritual or religious beliefs. It is served by religious activities (e.g., prayer), perceived spiritual presence, and a sense of union with something that is beyond us and yet part of us.

An important implication of this approach is that hope does not exist in a social or spiritual vacuum. While acknowledging that hope can be based on one's sense of control, this approach also proposes that hope can be evoked by an external system that includes the family, culture, and religious institutions. Hence, although one can find hope through personal strengths, hope is often enabled because of emotional or instrumental support from others and the sense of assurance or guidance from a higher spiritual power (see also Herth, 1991). This approach shows promise. State and trait measures of the four hope domains have been developed and preliminary data show acceptable psychometric properties (Scioli et al., 2011). But this approach is at the infancy stage of development, and many questions await investigation. For instance, the exact mechanisms by which social environments and religious institutions inspire hope remain unclear.

Definitions and Measures of Hopelessness

Hopelessness is widely defined as a negative cognition about the future. It is associated with a lack of enthusiasm, a motivational tendency to give up, and a dearth of positive expectancies (Beck et al., 1974). Based on this definition, the Beck Hopelessness Scale was developed. Other hopelessness measures have been developed for specific populations. For instance, based on the Beck Hopelessness Scale, Kazdin et al. (1983) developed and validated the Hopelessness Scale for Children (ages seven and older). Fry (1984) developed the Geriatric Hopelessness Scale to measure diminished abilities, lost interpersonal worth, and difficulty in recovering spiritual faith in the elderly.

The relationship between hopelessness, and depression and suicidal behavior has been the subject of a large body of research. The influential hopelessness theory of depression (Abramson et al., 1989) situates hopelessness as a proximal and sufficient cause of depression. The theory argues that the combination of cognitive vulnerability and negative life events causes depression. Cognitive vulnerability is the tendency to attribute negative events to stable and global causes, view them as likely to further produce negative effects, and construe the self is worthless. This cognitive bias is theorized to produce hopelessness, which, in turn, increases the risk of depression. There is strong empirical support that cognitive vulnerability interacts with negative events to predict depression and the process is mediated by hopelessness (e.g., Hankin et al., 2005; Metalsky and Joiner, 1992).

Research has found hopelessness to be a strong predictor of suicidal cognition and behavior (e.g., Beck et al., 1990; Beck et al., 1989). Some researchers have argued that hopelessness is a stronger predictor of suicidal cognition and behavior than depression is (e.g., Wetzel et al., 1980). There is also evidence that hopelessness mediates the relationship between depression and suicidal tendencies (Beck et al., 1990; Petrie and Chamberlain, 1983). Understandably, clinicians have advocated reducing hopelessness as a key intervention strategy to reduce suicide risk (Beck et al., 1990; Brown et al., 2005).

Therefore, there is striking evidence that hopelessness is a key precipitating factor of depression and suicidal tendency. More could be done to examine the conditions under which hopelessness leads not to suicidal responses and depression but to other negative outcomes. For instance, not everyone who feels hopeless about the future makes suicidal attempts; some might resort to violence to get what they want. Not everyone who feels hopeless experiences depression; some might feel unfair that their wishes have not been fulfilled and hence anger.

Similarities and Differences between Hope and Hopelessness, and Other Constructs

Hope is frequently compared to optimism. Research has indicated that hope and optimism can be subsumed under a single higher-order factor that reflects constructive future-focused thinking (Bryant and Cvengros, 2004). These two constructs do overlap to some extent. Optimism is considered to be a generalized expectation that the future will be positive (Scheier and Carver, 1985). This definition coincides considerably with Snyder's hope, which involves positive, goal-focused cognitive expectancy.

However, the two constructs are very different. In Snyder's (2002) view, optimism is the anticipation of attaining the desired outcome (outcome expectancy), whereas hope is the interplay between agency and pathways. Research has also differentiated these constructs. In one study, participants were asked to describe hope and optimism and their descriptions were coded (Bruininks and Malle, 2005). The results showed that participants perceived the optimistic person as having greater control over events than the hopeful person. They saw optimism-related events as more in one's favor than hope-related events. Hope was also perceived as lower than optimism in terms of the subjective likelihood of goal attainment. The results also suggest that optimism is more strongly associated with positive affect than hope is.

Hope is also different from challenge/determination. To be accurate, there are some similarities between them. In both constructs, attention is focused on an important but unrealized goal. Both emotions motivate perseverance. Also, measures of hope and challenge/determination are positively correlated (e.g., Smith and Kirby, 2009).

However, challenge/determination appears to be a stronger motivator than hope in compelling a person to learn and master a tough situation or skill (Lazarus et al., 1980; Smith and Kirby, 2009). As such, it is thought that a prime benefit of challenge/determination is personal growth and mastery. In contrast to hope, which, as mentioned above, has been found to be associated with a low sense of control over the goal situation, challenge/determination has been found to be associated with appraisals of high control and high coping potential (Smith and Kirby, 2011). Compared to hope, challenge/determination compels a person to invest more effort to attain the targeted goal.

Hope is also not wishing and fantasizing. Bruininks and Malle (2005) found that in wishing and fantasizing, one perceives even less control over the goal situation compared to hope. Also, the desired outcome one fantasizes about tends to be perceived as unlikely or impossible to materialize. Hence, a person who simply wishes or fantasizes is likely to abandon the goal. In contrast, hope induces a stronger commitment to the goal, even if the person feels that he or she has little control over the situation.

Wanting and desiring are similar to hope in terms of the strong focus on important goals. However, Bruininks and Malle (2005) found that wanting and desiring, more than hope, occur when the outcome is appraised as highly possible to occur. In contrast, situations that elicit hope tend to be those in which the goal is appraised as difficult (but not impossible) to obtain and in which the circumstances are deemed as difficult to control (Roseman et al., 1990).

Hope bears some similarity to self-efficacy. Snyder's pathways and agency thinking seem similar to Bandura's (1997) outcome expectancy and efficacy expectancy, respectively. However, according to Snyder (2002), pathways thinking reflects the belief of whether the self has the overall capability to generate the routes to goals, but outcome expectancy refers to whether one can generate solutions specifically for the current problem, and agency thinking reflects the intention that one *will* perform the goal-approaching actions but efficacy expectancy refers to the belief about whether one *can* perform these actions. Also, self-efficacy thoughts are accorded the pivotal driving role in Bandura's theory, whereas agency and pathways are given equal weight in Snyder's model.

Hopelessness and anxiety share some features. Both are highly distressful and are associated with negative evaluation of the future. Both are associated with a low sense of control over the situation. However, according to Pekrun and Stephens (2010), the main difference between them lies in anxiety being an activating state (i.e., physiologically activating, high arousal) and hopelessness being the opposite, deactivating state. More research is needed to clarify the differences between these two constructs.

Increasing Hope and Decreasing Hopelessness

A point shared by the different approaches outlined above is that hope occurs in response to goals. Hence, what goal is being pursued can influence the amount of hope one can feel. To this end, it is important to set realistic goals. It is also important to set goals that one wants rather than those that other people want. Other strategies include producing an array of goals, setting goals that stretch one's talents, and setting concrete and achievable goal markers (Nezu and D'Zurilla, 1981).

According to Snyder (2002), hope can be increased by two channels – agency and pathways. Strategies that enhance the sense that one is able to do things that bring about the desired outcome should increase agency. These include recalling previous incidents of successful goal attainment, focusing on attainable goals, positive self-talk, anticipating and viewing impediments as challenges, and even engaging in energy-boosting activities such as exercise. Strategies that help a person to improve his or her ability to generate multiple routes to goal attainment can increase pathways. These include breaking a goal into smaller attainable steps, developing mental maps to goals, generating different solutions to problems, learning and mastering particular skills, and developing supportive social networks.

Mirroring the hopelessness theory of depression, Needles and Abramson (1990) propose the recovery model of depression to fight hopelessness. The recovery model proposes that an enhancing inferential style over positive events should increase hopefulness and also reduce depressive symptomatology. This inferential style involves attributing positive events to global and stable causes, inferring positive consequences, and believing in one's self-worth. Numerous studies have found support for this model (e.g., Johnson et al., 1998; Needles and Abramson, 1990).

Conclusion and Caveats

Among the many ways that make humans unique as a species is the ability to imagine. This ability underlies hope because hope is about envisioning a better future. However, like other positive emotions, there are downsides to hope. People can hope for outcomes that are unlikely to occur (Averill et al., 1990). Hope can degenerate into wishing thinking, in which one fails to see that the odds are impossible to overcome and that the goal is impossible to attain, and yet continues to pursue it or waits for it to materialize. Also, it is one thing to feel hopeful for the moment, but another to remain hopeful over a long period of adversity. Techniques that enable a person to remain hopeful over a period and difficult period are in need. Nevertheless, hope is a critical emotion because it sustains people when they feel helpless, enabling them to focus on their dreams despite what others perceive to be crippling obstacles.

Acknowledgment

This article is based in part on the previous contribution by Dr. Charles R. Snyder. It is an honor to be given the opportunity to build on his work. This article is written in memory of him and a tribute to his excellent contribution to research on hope.

Horticultural Societies

Paul Sillitoe, Durham University, Durham, UK

© 2015 Elsevier Ltd. All rights reserved.

Abstract

After distinguishing horticulture from agriculture, this article goes on to introduce various horticultural societies according to agronomic regimes – shifting cultivation, bush fallow, ley, and agricultural systems – and sociocultural orders – egalitarian/tribal societies, chiefdoms, peasantries, and industrial-urban – to give a typology of horticultural societies. Following this, it discusses the extensive changes that have occurred in horticultural societies, often initiated in the name of economic development – such as the introduction of new crop varieties – and mounting concerns for the sustainability of some horticultural regimes with pressure on natural resources and accelerating environmental degradation, notably through global climate change.

A horticultural society is one in which people's livelihoods depend on the cultivation of small plots, commonly called gardens. These frequently support a wide range of crops and meet staple subsistence needs. The proportion of produce sold on the market varies, to finance the purchase of commodities manufactured elsewhere (e.g., clothing, processed food, hardware, etc.). The scale of society and its organization may vary widely too, from small tribal groups to large peasant populations.

The Term 'Horticulture'

Horticulture is distinguished from agriculture by scale of production, specialization, and commercialization. Agriculture features in industrialized societies supplying food to large urban populations. It is, in some regards, the reverse of horticulture. It involves the farming of large fields, usually under a monocrop (all wheat, potatoes, beans, etc.), whereas the gardens of horticulturalists usually feature intercropping, the mixing up of several different crops, as opposed to their segregation in separate rows or plots. There are sound ecological reasons for this practice, including maximizing on nutrient and water availability, controlling pests and diseases, increasing photosynthetic efficiency, exploiting microenvironmental variations to best effect, and so on. Agriculture features highly mechanized production techniques, whereas horticultural societies rely more on human labor and animal drought power. Farmers in agricultural systems meet few of their own subsistence requirements, specializing in the large-scale production of a few foodstuffs for sale on the market. They engage in agribusiness, intensive production often making use of inputs to boost yields, frequently obtained from off-farm and industrially manufactured (inorganic fertilizers, biocides, etc.). The term horticulture has a quite different meaning in such urban-industrial contexts, which can confuse the unwary. It refers to the intensive production, often under artificial glasshouse conditions, of high value crops, such as early vegetables, salads, and flowers by commercial growers.
